# **A Brief Guide to the Celestial Ruby**

**by Eirenaeus Philalethes, 1694 AD**

## **Concerning the Philosopher's Stone and its Grand Arcanum**

The Philosopher's Stone is a certain heavenly, spiritual, penetrative, and fixed substance, which brings all metals to the perfection of gold or silver (according to the quality of the Medicine), and that by natural methods, which yet in their effects transcend Nature.

It is prepared from one substance, with which the art of chemistry is conversant, to which nothing is added, from which nothing is taken away, except that its superfluities are removed. No one will question the utility of our Art, if he believes that it enables us to transmute base metals into gold. That base metals are capable of such transmutation is clear; Nature has destined them all to become gold, but they have not been perfectly matured. If, then, that which hinders their perfect digestion be removed, they will all become gold; for crude, cold, and moist Mercury is the common first substance of gold as well as of the other metals. Hence all other metals may be perfected into gold, by the aid of our Divine Magistry, which, being projected upon imperfect metals, has power to quicken the maturing process by as much as itself exceeds the standard maturity of gold. How patent, then, must the spiritual nature of our Stone be, which can effect more in one hour by a bare projection than Nature in the course of ages. If that substance which Nature supplies be taken in hand by Art, dissolved, coagulated, and digested, its perfection is increased from a monadic to a denary virtue; by repeating the same process, it is increased a hundred-fold, and then a thousand-fold, etc. This wonderful Medicine penetrates each smallest part of the base metals (in the proportion of 1::1,000) and tinges them through and through with its own noble nature: your arithmetic will fail sooner than its all-prevailing power. Each smallest part that is pervaded with the vitalizing power of the Elixir in its turn tinges that part which is nearest to it until the whole mass is leavened with its marvellous influence, and brought to the perfection of gold. This is done in a very short time, on account of the spiritual nature of the agent; it is the true metallic fire, and as a common fire warms even those parts of any object which are not in immediate contact with the fire, so this Elixir penetrates dissolved and melted metals in a moment of time—just in the same way as the virtue of leaven or yeast is brought to bear even upon those parts of the meal which it never reaches. A reproach is sometimes levelled at our Art, as though it claimed the power of creating gold; every attentive reader; of our former tract will know that it only arrogates to itself the power of developing, through the removal of all defects and superfluities, the golden nature, which the baser metals possess in common with that highly-digested metallic substance.

Listen, then, while I make known to you the Grand Arcanum of this wonder-working Stone, which at the same time is not a stone, which exists in every man, and may be found in its own place at all times. Let the knowledge which I declare is not intended for the unworthy, and will not be understood by them. But to you who are earnest students of Nature God will, at His own time, reveal this glorious secret.

I have shewn that the transmutation of metals is not a chimerical dream, but a sober possibility of Nature, who is perfectly capable of accomplishing it without the aid of magic and that this possibility of metallic transmutation is founded upon the fact that all metals derive their origin from the same source as gold, and have only been hindered from attaining the same degree of maturity by certain impurities, which our Magistry is able to remove. Let me tell you, then, what is the nature of this grand arcanum, which the Sages have called the Philosopher's Stone, but which is in every man, in every thing, at every season of the

year, if it be sought in the right place.

It must consist of the elements, for they are the universal substance of all things, and as it is of a nature homogeneous with that of gold, it must be that which contains the qualities of all elements in such a combination as to render it incapable of being destroyed by fire. It follows, then, that you must look for the substance of our Stone in the precious metals, since the required combination of elements is not found anywhere else. Those foolish sophists who seek it outside the domain of metals will never arrive at any satisfactory conclusion. For there is only one true principle, and nothing heterogeneous must be introduced into our Magistry.

For as a lion is always born of a lion, and a man of a man, so all things owe their birth to that which they are like; that which is combustible is derived from that which is combustible, that which is indestructible from that which is indestructible. Nor must we expect to find the principle which imparts the qualities of gold anywhere but in gold itself. If, indeed, we were able to create the sperm of things, we might hope to evolve this metallic principle from plants or animals which do not contain it; but that is the privilege of God alone. We must be content to dispose and develop the sperm which is made ready to our hands—new things we are unable to produce, and even if we could, our artificial seed would be no better than that which Nature has provided. If any one calling himself a Sage cannot use the things which are already created, it does not seem likely that he will be able to create new things out of heterogeneous substances—the seeds of metals out of herbs or animals.

Thus, you see that the Stone which is to be the transformer of metals into gold must be sought in the precious metals, in which it is enclosed and contained.

But why is it called a Stone, though it is not a stone; and how is it to be found? The Sages describe it as being a stone and not a stone; and the vulgar, who cannot imagine how so wonderful a thing should be produced except by art-magics decry our science as impious, wicked, and diabolical. Some silly persons clamour for an Act making the profession or practice of this Art punishable by statute law. Now, one can hardly be angry with the illiterate and ignorant persons who raise this cry; but when it is taken up by men of exalted station and profound learning, one hardly knows what to say. These men I also reckon among the rude multitude, because they are deplorably ignorant of everything pertaining to our Art, and yet, forgetful of their dignity, they join in the hue and cry against it, like so many cowardly village curs. It is neither religious nor wise to judge that of which you know nothing; and yet that is exactly what these people do, who claim to be both Christians and scholars.

But let us return to the point from which we strayed. Some Alchemists who are in search of our Arcanum seek to prepare something of a solid nature, because they have heard the object of their search described as a Stone.

Know, then, that it is called a stone, not because it is like a stone, but only because, by virtue of its fixed nature, it resists the action of fire as successfully as any stone. In species it is gold, more pure than the purest; it is fixed and incombustible like a stone, but its appearance is that of very fine powder, impalpable to the touch, sweet to the taste, fragrant to the smell, in potency a most penetrative spirit, apparently dry and yet unctuous, and easily capable of tinging a plate of metal. It is justly called the Father of all miracles, containing as it does all the elements in such a way that none predominates, but all form a certain fifth essence; it is thus well called our gentle metallic fire. It has no name of its own; yet there is nothing in the

whole world whose name it might not with perfect propriety bear. If we say that its nature is spiritual, it would be no more than the truth; if we described it as corporeal, the expression would be equally correct; for it is subtle, penetrative, glorified, spiritual gold. It is the noblest of all created things after the rational soul, and has virtue to repair all defects both in animal and metallic bodies, by restoring them to the most exact and perfect temper; wherefore is it a spirit or quintessence.

But I must proceed to answer the second and more important part of my question. How is this Stone to be obtained? It does not exist in Nature, but has to be prepared by Art, in obedience to Nature's law. Its substance is in metals; but in form it differs widely from them, and in this sense the metals are not our Stone. For if we would elicit our Medicine from the precious metals, we must destroy the particular metallic form, without impairing its specific properties. The specific properties of the metal have their abode in its spiritual part, which resides in homogeneous water. Thus we must destroy the particular form of gold, and change it into its generic homogeneous water, in which the spirit of gold is preserved; this spirit afterwards restores the consistency of its water, and brings forth a new form (after the necessary putrefaction), a thousand times more perfect than the form of gold which it lost by being reincrudedated.

It is necessary, then, to reduce metallic bodies to their homogeneous water which does not wet the hands, that from this water there may be generated a new metallic species which is nobler by far than any existing metal, viz., our Celestial Ruby.

The whole process which we employ closely resembles that followed by Nature in the bowels of the earth, except that it is much shorter. Nature produces the metals out of cold and humid Mercury by assiduous digestion; our Art takes the same crude, cold, and humid Mercury, and conjoins with it mature gold, by a secret artifice; the mixture represents a new and far more potent Mercury, which, by digestion, becomes not common gold, but one far more noble, which can transmute imperfect metals into true gold.

Thus, you see that though our Stone is made of gold alone, yet it is not common gold. In order to elicit our gold from common gold, the latter must be dissolved in our mineral water which does not wet the hands; this water is Mercury extracted from the red servant, and it is capable of accomplishing our work without any further trouble to the Artist. It is that one true, natural, first-substance, to which nothing is added, from which nothing is subtracted, except certain superfluities, which, however, it will cast off without any aid by its own inherent vital action. The chief object of your perseverant efforts should be the discovery of this Mercury, or the albification of our red Laton; all the rest is mere child's play, as the Artist has only to look on while Nature gradually matures his substance.

But remember that our albification is by no means an easy task. Gold which has been thus whitened can never resume its old form, for, instead of being corporeal and fixed, it is now spiritual and volatile. Concentrate your whole mind, therefore, on the whitening of the Laton. It is easier to make gold than thus to destroy its form; he who so dissolves it may be said rather to coagulate it-for dissolution of the body and coagulation of the spirit are coincident in it.

Consider these signs, ye sons of knowledge. That which dissolves is spirit; that which coagulates is body. A body cannot enter a body so as to cause dissolution; but a spirit can enter it, attenuate and rarefy it; and as you seek water, you need water to bring it to light; for every Agent has a tendency to assimilate to itself that which it acts upon, and every natural effect is conformed to the nature of the efficient; hence water is necessary if you would extract water from earth.

When I speak of water, I do not mean aquafortis, royal water, or any other corrosive whatsoever, for these waters, instead of dissolving metals, only corrode, mar, and corrupt them, without destroying their old form, to which task they are insufficient, as they are not of a metallic nature. No, our water is the water Mercury, which dissolves homogeneous metallic bodies, and mingles with them in indissoluble union, abides with them, is digested with them, and together with them becomes that spiritual whole which we seek. For everything that dissolves a substance naturally (still preserving the specific properties of the thing dissolved) becomes one with it both materially and formally, coalesces with it, and is thickened by it, thus nourishing it; as we see in the case of a grain of wheat, which, when dissolved by the humid earthy vapour, thereby takes up that vapour as its radical moisture, and grows together with it into a plant. We may also observe that, every natural dissolution being a quickening of that which was dead, this quickening can take place only through some vital agent which is of the same essence with the dead thing; if we wish to quicken the (dead) grain of wheat, we can do this only by means of an earthy vapour, which, like the grain itself, is a product of the earth. For this reason common Mercury can have no quickening effect on gold, because it is not of the same essence with it. A grain of wheat sown in marshy soil, so far from being quickened into life, is, on the contrary, destroyed, because the aqueous humour of the soil is not of the same nature. In like manner, gold, if mixed with common Mercury, or with anything except its own essential humour, is not dissolved, because such waters are too cold, crude, and impure; for which reason, being utterly unlike gold, they cannot amalgamate with it, or attain with it to a far nobler degree of development. Our Mercury, indeed, is cold and unmaturred in comparison with gold; but it is pure, hot, and well-digested in respect of common Mercury, which resembles it only in whiteness and fluxibility. Our Mercury is, in fact, a pure water, clean, clear, bright, and resplendent, worthy of all admiration.

If you wish for a more particular description of our water I am impelled by motives of charity to tell you that it is living, fluxible, clear, nitid, as white as snow, hot, humid, airy, vaporous, and digestive, and that gold melts in it like ice in warm water; moreover, that in it is contained the whole regimen of fire, and the sulphur which exists but does not predominate in it. This water is the true Keeper of our Gates, the Bath of the King and of his Queen, which warms them incessantly, but is not taken of their substance, and is distinct from the whitening substance of the water, though the two are united and appear under the same flowing form and colour. It is our vessel, our fire, the abode of our furnace, by whose continuous and gentle warmth the whole substance is digested. If you know this water, it will be seen to contain all our fires, all our proportions of weight, all our regimens. It is Bernard of Trevisa's clear pellucid Fountain, in which our King is cleansed and strengthened to overcome all his foes. All you have to do is to find this water and to put into it the purified body; out of the two Nature will then produce our Stone.

This mineral water can be extracted only from those things which contain it; and that thing from which it is most easily obtained is difficult to discover, as is also the mode of its extraction. It dissolves gold without violence, is friendly to it washes away its impurities, and is white, warm, and clear Without our Mercury, Alchemy could not be a science, but only a vain and empty pretence. If you can obtain it, you have the key of the whole work, with which you can open the most secret chambers of knowledge. Its nature is the same as that of gold, but its substance is different, and the preparation of it causes a great stench. Weigh well the possibilities of Nature; refrain from introducing any heterogeneous element into our Magistry, and do not blame me if you fail to understand my words. . Our Stone is produced from one thing, and four mercurial sub-. stances, of which one is mature; the others pure, but crude, two of them being extracted in a wonderful manner from their ore by means of the third. The four are amalgamated by the intervention of a gentle fire, and there subjected to coction day by day, until they all become one by natural (not manual)

conjunction.

Afterwards, the fire being changed, these volatile substances should be fixed and digested by means of heat which becomes a little more powerful every day (i.e., by means of fixed and incombustible Sulphur of the same genus) until the whole compound attains the same essence, fixity, and colour.

There are twelve degrees or phases of this our process, which I may briefly enumerate and describe as follows. The first is Calcination.

Calcination is the first purgation of the Stone, the drying up of its humours, through its natural heat, which is stirred into vital action by the external heat of water-whereby the compound is converted into a black powder, which is yet unctuous, and retains its radical humour.

This calcination is performed for the purpose of rendering the substance viscous, spongy, and more easily penetrable; for gold in itself is highly fixed, and difficult of solution even in our water; but through this calcination it becomes soft and white, and we observe in it two natures, the fixed and the volatile, which we liken to two serpents. In order that a full dissolution may be made, there is need of contrition, that calcination may afterwards produce a viscous state, when it will be fit for dissolution.

When the substances are first mixed, they are at enmity with each other, by reason of their contrary qualities, for there is the heat and dryness of the Sulphur fiercely contending with the cold and moisture of the Mercury. They can only be reconciled in a medium which partakes of both natures, and the medium in which heat and cold are reconciled is dryness which can co-exist with both. Thus cold and heat are brought to dwell peaceably together in the dryness of the earth, and dryness and moisture in the coldness of the water. This reconciliation of contrary qualities is the second great object of our calcination.

Its sufficient cause is the action of the inward heat upon the moisture, whereby everything that resists it is converted into a very fine powder; the moving and instrumental cause is the fire contrary to Nature, which, being hidden in our solvent water, battles with its moisture and digests it into a viscous or unctuous powder.

This operation takes place before our dissolution, because whenever bodies are dissolved, the spirits in their turn are congealed. Again, the woman must reign, before she is overcome by the man. The dominion of the woman is in the water, and if the man overcome her in the element in which both her qualities of coldness and moisture inhere, he will easily conquer her where she has only one quality.

Calcination, then, is the beginning of the work, and without it there can be neither peaceable commixtion nor proper union. The first dealbation reduces the substance to its two principles, sulphur and quicksilver, the first of which is fixed, while the other is volatile. They are compared to two serpents, the fixed substance to a serpent without, and the volatile substance to a serpent with, wings. One serpent holds in his mouth the tail of the other, to shew that they are indissolubly conjoined by community of birth and destiny, and that our Art is accomplished through the joint working of this Mercurial Sulphur, and sulphureous Mercury. Hence the whole compound is at this stage called Rebis, because there are two substances but only one essence. They are not really two, but one and the same thing the Sulphur is matured and well digested Mercury, the Mercury is crude and undigested Sulphur. It has already been said that in our Art we imitate Nature's method of producing metals in the bowels of the earth, except that our method is shorter and more subtle. In metallic veins only crude and frigid Mercury is found, in which the inward heat or

dryness (i.e., Sulphur) can scarce make its influence felt. No digestive heat is found there, but in the course of ages an imperceptible motion changes this metallic principle. In the course of centuries, however, this imperceptible digestive heat changes the Mercury into what is then called fixed Sulphur, though before it was denominated Mercury.

But in our Art, we have something besides crude and frigid Mercury, viz., mature gold, with its manifold active qualities. These are united to the passive qualities of our Mercury; and so one aids and perfects the other, and as we have two fires, instead of the one slow inward fire of Mercury, the operation is more expeditious, and something far nobler than common gold is produced.

Thus you see that in our Art we have two Sulphurs and two Mercuries (i.e., Sulphur, and Mercury of Mercury, and Sulphur and Mercury of gold), but their only difference consists in degrees of perfection and maturity. Now, the perfect body of gold is reduced to its (two) first principles by means of our Divine water which does not wet the hands (viz., Mercury and Sulphur). This operation for a time gives the ascendancy to the female agent; but this being unnatural, the male agent soon reasserts itself, and by means of its heat dries up the moisture of the female agent, and-through calcination-converts it all into a most subtle and viscous powder, which powder is then changed by dissolution into a water, in which the spirits of the solvent and the thing dissolved, the male and the female principles, are mingled. But the inward heat, which has once been roused into action, still continues to work, separating the subtle (which floats on the surface) from the gross (which sinks to the bottom), until the man has gained the upper hand, the inseparable union takes place, and the male impregnates the female; the female brings forth a nebulous vapour, in which they are putrefied and decay, and from which both arise with a glorious body, no longer two, but only one by inseparable conjunction. This new birth is then coagulated, sublimed, nourished, and exalted to the highest degree of perfection, and may afterwards be indefinitely multiplied by fermentation, and used both for projection and as an Universal Medicine. We see, then, that these black and fetid ashes are not to be despised, since they contain the Diadem of our King; your substance will never be white, if it has not first been black. It is by means of putrefaction and decay that it attains the glorified body of its resurrection. Therefore, you should honour the tomb of our King, for unless you do so, you will never behold him coming in his glory.

A great many students make a mistake at the very outset by performing this calcination on a wrong substance-borax, or alum, or ink, or vitriol, or arsenic, or seeds, or plants, or wine, vinegar, urine, hair, blood, gum, resin, etc; or they choose a false method, and corrode instead of calcining the metallic bodies on which they operate. Calcination can take place only by means of the inward heat of the body, assisted by friendly outward warmth; but calcination by means of a heterogeneous agent can only destroy the metallic nature, in so far as it has any effect at all. Every calcination of gold, which is not succeeded by a spontaneous dissolution, without laying on of hands, is also fallacious.

The true calcination is by means of Mercury, which (being added to gold in due proportions) softens and dissolves the gold, and, by its inward heat, united to outward heat, stirs into action the native heat of the gold, and thus causes it to dry up its humidity into that fine, viscous, black powder. And this is the true key of the work-to incrudate the mature by the conjunction of an immature-being incrudated to calcine it-being calcined to dissolve it-and all this philosophically, not vulgarly.

The outward signs of the calcination are as follows:-When the gold has become saturated with water, and the fire of the Mercury has called into play the heat of the bath, the water which was so brilliant begins to

grow dim, then visibly swells and bubbles, until the whole becomes a fatty and viscous powder, which, however, still retains its radical humour. For when the heat first begins to operate, the cold and the moist seek refuge by rising to the top; thence they descend in liquid form and assimilate as much of the substance as they can to themselves; thus the powder is converted into a glutinous water. For between the different processes of our Art, there exists such a concatenation that not one can be produced or understood without the rest. In order to hide our meaning from the unworthy, we speak of several operations; but all these-the whole progress of the substance from black to white and red-should be philosophically understood as one operation, one thing, one successive disposition to black, white, and red.

The following rules should be observed if you wish to bring about true calcination:- In the first place, you must procure our Mercury; common Mercury will produce no effect if you operate on it till doomsday.

Secondly, the external fire of the furnace should be neither too violent (in order that the equilibrium of chemical forces in the substance may not be disturbed), nor yet too gentle, so that the action of the inward fire may not languish for want of outward heat. It should be just such as to keep up an equable vital warmth.

In the third place, the Laton should receive neither too much nor too little to drink. If it receive too much, it will not be able to give it out, and a nebulous tempest will arise; if too little, it will be burnt to cinders. The activity of the Sulphur must dry up the superfluous humour of the Mercury; therefore, the active (sulphur) must not be swamped with too much sperm; nor must the moisture be choked with too much earth. The proportions should be between two or three parts of water to one of gold; but the larger the quantities of both substances, the more perfect will the calcination and dissolution be. The chief mistake against which you must guard is the swamping of your earth with water. For the earth contains the fire, which is the principal digestive in our Art.

In the fourth place, you should take care to seal up your vessel properly, to prevent the spirit from evaporating. Consider how carefully Nature has closed up the female womb to prevent anything from escaping or entering that might prove hurtful to the young life; and quite as much (if not more) care is required in our Magistry. For when the embryo is being formed, great winds arise, which must not be allowed to escape-or else our labour will have been all in vain.

The fifth requisite in our work is patience. You must not yield to despondency, or attempt to hasten the chemical process of dissolution. For if you do so by means of violent heat, the substance will be prematurely parched up into a red powder, and the active vital principle in it will become passive, being knocked on the head, as it were, with a hammer. But our true calcination preserves the radical humour in the body dissolved, and converts it into an unctuous black powder. Patience is, therefore, the great cardinal virtue in Alchemy. It must not be supposed that the signs and colours which I describe appear on the first day, or even within the first week: Bernard of Trevisa tells us that he waited in an anguish of expectation for forty days, and then returned and saw clouds and mists. You need the patience of the husbandman, who, after committing the seed to the earth, does not disturb the soil every day to see whether it is growing... As soon as you have prepared your substance i.e., mixed mature yellow sulphur with its crude white sulphur, put them in a vessel and let them stand undisturbed; at the end of twenty-four hours, the Mercury, which is attempting to rouse the latent fire of the sulphur, will begin to effervesce and send up bubbles. But little variation of colour shall appear until the object of the Mercury has been accomplished, and the Royal Bath prepared; at first it is the Mercury alone that is at work. When, however, the Bath has been made hot (i.e., the inward warmth of the gold roused) the greater part of our work is over, and we shall be easily able to

distinguish the various operations. The first colour which appears after the silver colour of the amalgamated body, is not perfect blackness, but only a darkish white; the blackness becomes more pronounced day by day, until the substance assumes a brilliant black colour. This black is a sign that the dissolution is accomplished, which does not come about in one hour, but gradually, by a continuous process; for the Tincture which comes out of the Sun and Moon appears black to the eyes, but is insensibly and imperceptibly extracted. When the whole of the Tincture has been extracted from the body that is to be dissolved, the blackness is complete. The more you digest the substance at first, the more you subtilize the gross, and blacken the compound. There are four principal colours, the first of which is blackness; and it is of all colours the most tardy in making its appearance. But as soon as the highest degree of intense blackness has been reached (there being no idle intervals in our work), that colour begins little by little to yield to another. The time during which this blackness is developed is very long, and so is the time during which it disappears; but it is only for one moment that the blackness neither increases nor decreases: for things find rest only in that which is the end of their being, but blackness is not the end of our substance.

The advent of the blackness is like the coming of the night, which is preceded by a long twilight-when the last ray of light has faded away, the blackness of night has come; only our work is more tedious, and the change is, therefore, still less perceptible.

It may be objected that the black tincture begins to be extracted as soon as the inward heat is roused, and that, therefore, the colour which appears must be, from the very first, an intense black. My answer is that the Tincture which is extracted is, as a matter of fact, not black, but of a dazzling white; and that the blackness is produced gradually, through the action of the water on the body, out of which it draws the soul (the tincture), thus giving the body up to decomposition. It is this putrefaction (the result of the mutual action of the Sulphur and Mercury) which imparts to the Tincture its black colour; in itself the Tincture is brilliantly white. How long, then, will you have to wait till perfect blackness appears? Flamellus tells us that this intense blackness comes at the end of about forty days. Ripley advises us to let the mingled substances remain together for six weeks, until the conception has taken place, during which time the fire must be very gentle. And Bernard (of Trevisa) suggests the same thing, when he says in his parable: " The King doffs his glorious robes, and gives them to Saturn, who clothes him in a garment of black silk, which he retains for forty days." Of course, the blackness which is here spoken of is not equally intense all the time, as you will understand from what has been said above.

In the course of this change from white to black, the substance naturally passes through a variety of intermediate colours; but these colours (being more or less accidental) are not invariably the same, and depend very much on the original proportion in which the two substances are combined. In the second stage, during which the substance changes from black to white, it is already far purer, the colours are more lucid, and more to be depended upon. In the two phases there are intermediate colours; but in the first they are more dingy and obscure than in the second, and very much less numerous. In the progress of the substance from blackness to whiteness (i.e., the second phase of our Magistry), the most beautiful colours are seen in a variety such as eclipses the glory of the rainbow; before the perfection of blackness is reached, there are also some transition colours, such as black, azure, and yellow-and the meaning of these colours is that your substance is not yet completely decayed; while the body is dying, the colours are seen, until black night shrouds the whole horizon in pitchy gloom. But when the process of resurrection begins (in the second phase) the hues are more numerous and splendid, because the body is now beginning to be glorified, and has become pure and spiritual.

But in what order do the colours of which we speak appear? To this question no definite answer can be given, because in this first phase there are so much uncertainty and variation. But the colours will be the clearer and more distinct, the purer your water of life is. The four principal colours (white, black, white red), always follow in the same order; but the order of the intermediate colours cannot be so certainly determined, and you ought to be content if within the first 40 days you get the black colour. There is only one caution you should bear in mind, in regard to this point: if a reddish colour appears before the black (especially if the substance begins to look dry and powdery at the same time), you may be almost sure that you have marred your substance by too violent a fire. You should be very careful, then, about the regulation of your fire; if the fire be just hot enough, but not too hot, the inward chemical action of our water will do the rest.

Our Solution, then, is the reducing of our Stone to its first matter, the manifestation of its essential liquid, and the extraction of natures from their profundity, which is finished by bringing them into a mineral water; nor is this operation easy: those who have tried can bear out the truth of my words.

## **An Epigram concerning the Philosopher's Stone.**

**by**

**Alexander de S., to Gulielmus Blancus.**

We dissolve the living body with Apollo's fire ---  
So that what was before a Stone may become a Spirit.  
From the inmost parts of this we extract Gold,  
Which, with natal seed, cleanses impure ores from the dross of their mother.  
After we have separated the bones, these kindred we then wash with water.  
From them is born a Bird, arrayed in various colours, and, being made white, it flies  
into the air.  
So we with new fire paint its wings, and, being coloured, imbue them with its milk:  
As for the rest, we feed it with Blood,  
Until, full grown, it may bear the fury of Mulciber (i.e., Vulcan-fire).  
This Bird, O Gulielmus! The Thrice Great Hermes called his own,  
And the whole world has not its like.  
O Christ, graciously grant that this blessed long-desired bird be born in our Garden!

---

## Prolocutory, Dedicatory Address

To the Worshipful, Noble, etc., etc., Master Michael Daniel Pleickhard, Surnamed Poland, of the High and Reverend Cathedral Chapter at Strasburg, Councillor; And to the Honoured, Learned, etc., etc., Master Balthazar Keyben, I.V. Doctor, in Frankfort-on-the-Main; as also to the Honoured, Most Experienced, etc., etc., Master John Enoch Meyer, Master Builder of the City of Strasburg, and Steward of the Convent of St. Nicholas in Undis, in that Ilk; His Generous, Well-Beloved Masters and Beneficent Patrons.

*Here Follows the Prolocutory, Dedicatory Speech.*

Worshipful, Noble, etc., generous Masters and Patrons, when reviewing the whole course of my studies, from my youth up, I find ---- and have indeed hitherto found in my work, and clearly experienced more and more with the lapse of time, as daily experience shews is wont to happen to the true believer and right naturalist --- that there are three kinds of Philosophy or Wisdom, of which the world partly makes use, some more than others, some of this and others of that. Yet one of these Three alone is Eternal, Indestructible, and may stand before God Almighty (of which, however, but few students are found) because it proceeds and flows from above from the Father of Light. Now, the First is the Common Philosophy of Aristotle, of Plato, and of our own time, which is but a Cagastrian Philosophy, Speculation, and Phantasy, with which, even at the present day, all the Schools are filled, and by which they are befouled, and beloved youth thereby led astray. The same is inane, erroneous, empty chatter; and far removed from the foundation of Truth. Even at the present day it is blasphemously defended, tooth and nail, with all sorts of opinions, ideas, imaginations, and erroneous thoughts of the old heathen (who were held to be Sages), which were accepted as the Truth. For it is derived from an unpropitious Heaven and Stars, evil Influences, also Inspirations of Satan, and at that time was considered a great mystery and Sacred Thing, as it also is at this present by the great majority of learned me. But this is an erroneous, false, fatal, misleading sophistry, which, like the body in the grave, is brought to naught but dust and ashes, and is the same against which the inspired Apostle Paul warns us in his Epistle: "Beware of vain Philosophy", and "Beware lest any man spoil you through philosophy and vain deceit".

This Philosophy, although, from my youth up, it was earnestly and diligently inculcated, and forced upon me, in the Schools (as unfortunately occurs to others at the present day), yet, by special interposition of the Holy Spirit, it became so suspected by me that I never would, nor could, torture my head, mind, and soul with it, nor persuade my heart that the same was a sacred thing, nor cleave unto it as others did; but, according to my childish judgment, let the matter rest there until, about the year 1587 or 1588, another philosophy came into my hands. At the same time I had, in my own mind, firmly resolved not to remain the least among my fellow scholars, but in due time to graduate in advance of all.

But it has pleased God otherwise in His Divine Providence, and all sorts of impediments on the part of my superiors hindered on the part of my superiors hindered the course of my studies, until at last, in 1587-88, the books and writings of

Theophrastus, of Roger Bacon, and of M. Isaac the Hollander, fell into my hands; in which I, (especially in medicine) for they wrote about the Universal Stone and Medicine), saw and found a better foundation, and yet understood it not at first. But I took such a liking to the subject that I resolved not to die, nor yet to take my ease, until I had obtained this Universal Stone and Blessed Heavenly Medicine. However, the poverty of my parents and the impossibility of obtaining the necessary funds (for at that time but few princes and nobles patronized this study) compelled me unwillingly to relinquish my plan, although I was so eager for it that, for many months, I could not sleep on account of it. At last, in 1590, I found myself plunged by the devil and his friends into great misery, misfortune, and sickness, out of which God mercifully helped me when my death would have been preferred to my recovery, and when, from reasons of poverty, I had been held to commerce against my will, by my relatives, suffering all manner of persecution, partly from the Anti-Christian mob, partly from false brethren, wife and friends, tortured, plagued and agitated, and thus thoroughly tried by the devil.

But having been rescued from the same by God's fatherly care, I turned my attention for some years to poetry, whereunto, when I found that it was irksome to all, I said good bye; and, only three years ago, I returned to this true Philosophy, the Study of Medicine and the Theophrastic School --- for which God be praised --- and have publicly declared myself a disciple of Paracelsus. From this neither the devil nor the world, with its serpents and viper brood, shall, or can, ever turn me away.

The other philosophy can never teach us the "know thyself", nor the foundation of Natural Revelation, in which some heathen philosophers, particularly Pythagoras, had progressed so far that they might with reason be preferred to many professed Christians of today. He especially from the stars and the creatures of this earth learnt more about Nature than our arrogant, boasting philosophers, who, at bottom, understanding nothing themselves, would fain teach others.

But this our Hermetic Philosophy, which comprises the true Astronomy, Alchemy, and magic, as also Cabala, etc., is an extremely ancient, true, Natural Science, derived from Adam, who, both before and after the Fall, had full knowledge of all things, and handed it down from father to son through the patriarchs and dear friends of God. After the Flood the general understanding and knowledge of this true natural philosophy became weakened in force and scattered in fragments in all directions; hence arose a subdividing of the whole into parts ---- and one has become an Astronomy, another a Magician, a third a Cabalist, a fourth an Alchemist, and especially did it afterwards flourish in Egypt. For instance, the smith, Abraham Tubalkain, past master in all kinds of brass and iron work, and also an excellent Astrologer and Arithmetician, brought these arts with him from Egypt into the Land of Canaan. And the great skill, wisdom, and knowledge in the above arts attained by the Egyptians was by them also communicated to other nations.

The Chaldeans, Hebrews, Persians, Egyptians, have also always possessed and cultivated this knowledge, together with Theology and instruction in Divine things. Thus, Moses was so informed by all good arts in the schools of the Egyptians that he became perfect in wisdom, and therefore was not in vain chosen by God to be the leader of the people of Israel.

Thus also Daniel, from his youth up, learnt and imbibed this art in the Schools of the Chaldeans, as his Prophecies, and his skill in all kinds of interpretation before King Nebuchadnezzar and King Belshazzar, clearly and wondrously testify. Such Philosophers and Magi were also the Three Wise Men from the East, who sought Christ Jesus from the Rising of the Sun, and found him in a manger at Bethlehem.

But subsequent to the origin of this Divine Magic and natural true Philosophy, namely, 27 years after the Flood --- about the year 1680, A.M. --- among the Chaldeans, Persians, and afterwards in Egypt, the idolatrous and superstitious Greeks, having heard of the same, their noblest and sagest men proceeded to Chaldea and Egypt, in order that they might learn such wisdom in their Schools. But they did not relish the teaching of God's word from the Holy Bible and the Law of Moses, and, depending upon their reason and understanding, wished to be cleverer and wiser than God Himself, as is the wont of Lucifer and his disciples; for it always happens that where God builds a Church, the devil sets his chapel up beside it; as is also recorded in the New Testament, for when Christ, the greatest Spagyric Philosopher and Heavenly Sower, sowed His good seed, the Enemy immediately threw his tares and weeds upon it, which, alas, happens to this day. Therefore have they fallen away from the foundation and essence of all Natural Mysteries and hidden Arts, and have sought wisdom in the senseless, stupid, erroneous, and deceptive Star of Satan, with which they have obscured and diluted the truth. For their own pride and presumption have hindered, befooled, and plunged them into error. For, after having learnt a little from the Chaldeans and Egyptians, they became to puffed up and proud, depending more than was meet on their own understanding, that they began to criticize things with many false and vain inventions, and took themselves to ascribe them to a false philosophy, concocted in their own subtle brains, under the influence of that evil star; which false philosophy not only go the upper hand among the Greeks, but spread from them to the Latins, who, not less than the former, also wished to shew their own understanding immediately they had acquired a kittle knowledge, whence, instead of improving, increasing, or adorning, they have only made things worse.

Now, by these this so-called Philosophy has been disseminated throughout entire Europe. Almost all Academies and High Schools teach it, to the neglect of Moses and the Prophets, even of Christ Himself not only in Germany, but in almost all other nations. When anyone advances aught of the true Philosophy, grounded in the Word of God, but which is contrary to theirs, he is not only condemned, mocked, and laughed at, but is called an eccentric, a heretic, and haeresiarch --- as has happened to me at the hands of certain pseudo-Levites --- or is even persecuted. The old proverb remains true: "The world wished to be deceived". Satan is a clever juggler, using many deceptions with which he leads astray all Christendom, shewing the way unto the eternal night of hell with his dark lantern, which they take to be a true guiding light. Let him who would be deceived continue in his present course; on a certain day he will find, with eternal lamentations, howling, and gnashing of teeth, how hot hell is.

But, generous Masters and Friends, if we would follow after the true Natural Philosophy, founded on the Light of Nature; if we would acquire the same as our Spagyric Philosophy, true Astronomy, and Magic, where and under whom we shall study this? Shall we seek the teachers and professors in the Universities? Verily, we shall not find it there, for they are the true enemies, mockers and persecutors of our

Philosophy, and of all its adherents. “Art has no haters but the ignorant”. They would rather remain with the husks and chaff, which the wind strews hither and thither, than with the good nourishing grain, ye, and wheat from the great store-houses or treasury of the Eternal God and Bountiful Lord, which He gives and invites us to partake of. Where then, I ask, shall we seek it, and in what school? Dear Masters and Friends, we neither can, nor should, nor must look for it elsewhere than in the Stars; there is the school from which everything is learned.

All Natural Art and Wisdom are given by the Stars to men, and we are the disciples of the Stars. The Constellations are our natural teachers. From the light of Nature we must learn as from our father from whom we are made and begotten. The Stars are our lawful instructors, for all understanding and Art come to us from them. God has so ordered it that the natural light is in the Stars, and in the same has He laid the treasure of men to be obtained from them. But what man learns from the stars in all temporal knowledge, reason, art; what also is of the light of Nature must be derived from the same source. In short, the firmament teaches us whatsoever pertains to things temporal. But that which pertains to the immortal soul, and to the godly conversation of the inner man, all that must be learned from God. For it concerns the Image of God, and it is the office of the Holy Spirit to instruct men in things eternal.

Now, there are two bodies in man, one formed from the elements, and the other from the stars. Through death the elementary body, with its spirit, is brought to the grave, and the ethereal body and spirit are consumed in their firmament. But the spirit of the Image goes to Him in whose image it is. Thus each one dies in that of which he is, and is buried in the same. Thus, also, does death divide from each other the three spirits of man. Therefore, the wise man is he who lives in the wisdom of the Lord, the same ruling over his planetary and elementary body. But, brethren, man should walk, as regards his earthly body, according to the law of Nature, as did the old heathen Sages; and, for the rest, in the Will of God and the Holy Spirit, and not set the mortal body with its wisdom above the Immortal Image (as almost all the world now does, with its fancied, spurious wisdom). Neither should he reject the Eternal Image for the animal body in his fancied wisdom, wherefore the Lord Jesus has not said in vain in His Gospel, concerning the tax penny.” “Render unto Caesar the things that are Caesar’s and unto God the things that are God’s”. What did He mean to convey by that? Why this, that the body, according to the natural life, belongs to Caesar, and shall be subject to him as to its earthly head upon earth. But the soul belongs to God, and the same shall be given again to God, and shall make answer for its work. That is, he shall return Him His Image according to the spiritual life, as to his Heavenly Lord, from whom body and soul each separately come. Therefore he shall walk in His laws according to the Will of God, that he may return to God his Image, and the eternal fiery breath of life entrusted him, as it were, shall be given into Abraham’s bosom, and not be cast out from before His Face eternally into outermost darkness on account of godless, devilish life and conversation. Such was Christ’s meaning and object. Now, he who lives according to the Image of the Lord, overcomes the stars, and should with reason be considered a wise man, although by a blind and senseless world he may be held as a fool.

But to philosophize further concerning these things belongs not in this place to mortal philosophy, but to the Eternal, Immortal wisdom, which we have alluded to, which has Christ Jesus as its Founder, concerning whom we have the voice of the Father, saying:

“Hear ye him”; so also His own voice calls to us (Matthew xi.): “Come unto Me all ye who are heavy laden... Learn from Me, for I am meek and lowly in heart”, etc. From Him must we derive the Heavenly and Eternal Philosophy in order that we may come to the Kingdom of Heaven. Of the above Philosophy we will, D.V., treat briefly elsewhere. But in this place we must consider somewhat more at length the Mortal and Natural Philosophy. For I am, and will remain to my grave, the fervent disciple and follower of the Natural and Mortal, and the Supernatural Heavenly Instruction, having totally repudiated the false, heathen wisdom which proceeds not from the true light and groundwork of Nature, since beside Christ and His Wisdom there is in the world only vanity of vanities. But to return to our intention of exploring Nature. Generous Masters and Friends, this cannot be done by sitting at the fireside nor by poring over philosophical tomes. No, if we would explore Nature in our Philosophy, and attain the desired successful results, we must tread the books of Nature with our feet. Writings are examined by means of letters, but Nature by going from land to land. In this way one finds occasionally pious and faithful Nicodemuses, Naturalists, Philosophers, Explorers of Nature, and Lovers of our Spagyric Philosophy (I speak not now of the knavish, vagabond, false Alchemists, on whose account I would not move a step). From such as these, in addition to one’s own observations, one can often obtain much useful knowledge. Hence each fresh country is a new leaf in the Book of Nature. Thus is our Codex Naturae sufficiently large and ample, the leaves of which must be turned over with our feet, and examined with the spirit of understanding, and, although we be called vagabonds and land loupers by the big wigged doctors and syrup boilers, that matters nothing to me. The disciple should not fare better than his master, and the same thing has happened to Theophrastus, our dear Preceptor and Monarch of Arts, also to Alex. von Suchten, Phaedro, and others. Therefore, on my journeys I regard but little what is made by men’s hands though others think much of it, but the works of God alone, these I regard, admire, and seek to explore. To find out their three principles, to separate the pure from the impure, and thereby, to the praise and glory of God, to benefit myself and my neighbors in body and soul, is my highest endeavor. For all created things are living letters and books in which can be deciphered the origin of man, in which also may be read what man is. Before all things, let everyone commend to himself the Nosce teipsum, that he may know himself, as Aristotle said to Alexander the Great: “Know thyself and thou shalt possess all things”; and Morienus: “Those who do in themselves hold all things, are in need of no other aid”.

Therefore also am I content with these three books, from which I may learn every wisdom.

The first is the great, full-meaning Book of Nature, written not with ink or stylus, but by the finger of God, wherein, lying open before our eyes, are inscribed and registered Heaven, Earth, and all creatures therein, through the sacred impress of the Three in One --- which volume is called Macrocosmus.

The second is the Small Book, which with all its leaves and pieces is taken from the larger work, and this is Man himself, for whose sake all that God has ever created is there; the same also is called Microcosmus. And man alone is the instrument of Natural Light, to fulfill and shew by arts and wisdom what God has ordered in the firmament. Also He has further ordered that man have a twofold magnet --- viz., one composed of three elements (his body), and hence also he attracts them to himself ---

another of the stars, by which he attracts from the stars the Microcosmic tense. Therefore, the Reason of man has a magnet which attracts into itself the mind and thoughts of the Stars. From these, I say, yet another arises in the true believers, Magi, and Cabalists, and this third magnet is hidden in the image of God, in man's soul. The same penetrates, through faith, to Him from whom it came, and seeks eternal wisdom from the Holy Ghost, promised by Christ to it. It must be well remembered that there are two souls in man, the Eternal and the Natural, that is, two lives. One is subject to death, the other resists death. Thus there also are two souls, the Eternal and the Natural --- the Natural soul is the starry body, and the starry body in the fleshly, and these two together form one man but two bodies.

There are also two heavens in man, the one is Luna Cerebrum, the Cagastrian heaven. But in the heart of man is the true Iliastic, Necroc cosmic heaven. Yes, the heart of man itself is the true heaven of Immortal being, out of which the Soul has never yet come, which New Olympus and Heaven Christ Jesus has chosen for a dwelling in all true believers. The third Book is the Holy Bible, the Holy Writ of the Old and New Testaments, which explains to us the two preceding Books. The Divine Chronicles, inspired by the Holy Ghost, shew how the Great World was created for the Small World (Man), who in the great world is fed, nourished, and preserved by God the Father. The same, after the Fall, was by God's Son delivered from everlasting punishment, who also has ben born again through water and the Spirit, is fed with the Heavenly Manna and Immortal Food of the new Creature, and is guided by the Holy Ghost to the knowledge of all truth.

Generous Masters and Friends, from these three Books we can, by the grace of God and the Holy Spirit, learn that which will profit us in body and soul for Time and Eternity, and avoid all heathenish deceitful books, of which the world is full.

But to return to our occult Hermetic Philosophy: Beloved Masters and Friends, we, with others, have to complain not a little that, although innumerable devilish philosophers have written about the Universal medicine and the Philosopher's Stone, yet both Heathens and Christians have left us true writings, which godless Cacosophists and pseudo-sophists have, for the most part, either wholly kept back or altered.

Truly this is a trick of the devil, that his jugglery and lies, with which he for many centuries dazzled and befooled the world, may not be brought to light.

We have further to complain of those who mutilate and falsify the works of true seekers after natural Wisdom and Art, for I have clearly discovered defects, alterations, and foreign matter in the *Triumphal Chariot* of Fr. Basilus, and also in the writings of A. von Suchten and Theophrastus. More especially, dear Friends, have we to complain of the devilish cunning way in which the works of Theophrastus have hitherto been suppressed, only a few of which (and those to be reckoned the very worst) having appeared in print. For although they have been collected together from all countries in which Theophrastus has lived and traveled --- the books he has written in Astronomy, Philosophy, Chemistry, Cabala, and Theology, numbering some thousand volumes --- yet the same has only been done from avarice to get riches. For, having been trafficked in and sold for great sums, they have become scattered among the courts of princes and nobles, while Christendom at large, for whose use and

benefit Theophrastus wrote, has no part in them. Particularly his theological works (because they annihilate the godless, and do not suit children of this world --- belly-servers, deceived by the devil), have hitherto been totally suppressed. For which devilish end Thurneyser, a true instrument of Satan, who with his lies and false Alchemy has cheated all the world, Electors and Princes, great and small, has (amongst others whom I will here spare) been made great us of.

But, at the Last Day, before the Judgment Seat of Christ, I, together with all true sons of the Doctrine, shall demand an account of them for having stolen, sold, divided, and shut Truth away in boxes, walls, and vaults, and behind locks and bolts. Now, these precious and revered writings were ordered by God in our latter times, through Theophrastus, for the use and weal of the whole of Christendom. As regards our dear, highly-favoured Monarch and Preceptor, Ph. Theophrastus, of blessed memory, we, for our part, will not suppress his Life, his well-merited praise, and his immortal fame, given him by God, the Angels, and the whole Firmament, but will heartily the whole Firmament, but will heartily defend his honour and teaching to the very end of our life. Therefore (D.V.), we shall shortly endeavor to promote the same in an especial manner by publishing, to begin with, his Cabalistic and Theological Books, for the weal and salvation of Christendom, in order that the three-headed Antichrist, or three unclean spirits in the Apocalypse, may be right well recognized and avoided by all. Being therefore resolved, with the aid of Christ, to publish as many of Theophrastus' works as can be got together, I shall do so in the comforting assurance and hope of cordial assistance and support from all zealous, Christian lovers and followers of the true and Christian Philosophy, derived from our Heavenly Philosopher, Christ Jesus. Therefore, for the Honour and Glory of Christ, and for the long-suppressed Truth, and for the sake of this beloved and noble Philosophy, Magic, and Alchemy, as also for God's sake, I call upon persons of high and low degree to assist me with such writings. For the same they shall be humbly and gratefully rewarded when we (D.V.) shortly reach our goal in Philosophy and Medicine. For then shall they learn and appreciate the truth of that which we and others have long sought for.

“What though adverse omens be scanned by a reprobate world! Yet the goddess will fully triumph at last.

“Sacred Truth is always enshrouded in darkness”.

Generous masters and friends, as regards the present little book, called by me *The New Golden and Olympic Pandora*, I have wished to publish the same (faithfully and without guile, jus as I have received it) for the benefit of disciples of the Spagyric Doctrine. It treats of the Philosopher's Stone, and has never appeared in print before. And, seeing that your Worships have for many years been special patrons of Alchemy and the Spagyric Art, possessing no little information and understanding in the same, I have wished to publish this book under your noble patronage, humbly begging your noble patronage, humbly begging you to accept thereof as from a well-known, yet poor disciple of the Theophrastian and Immortal Christian Philosophy, and to defend me and this philosophical book against all slanderers, mockers, and persecutors of these beloved Arts, and to assist in promoting and confirming the truth in every way. For which protection and favour, I will, by God's Grace and Blessing, faithfully testify my gratitude by word and deed.

Herewith commend I all and each of us to the Gracious Ward and Protection of God.

Done in our Scholarly Hermit's Cell, near Hagenau, on the day after the Festival of the Birth of Jesus Christ, our Trismegistus Spagyus, into this world, December 26th, 1607.

Your Worships', etc., etc.,

Most Officious Servant,

Benedictus Figulus of Utenhofen, Fr. Poet; L.C. Theologian; Theosopher;  
Philosopher; Physician; Hermit, T.M.

---

# **The Book of The Revelation of Hermes,**

**Interpreted by Theophrastus Paracelsus,**

**Concerning**

**The Supreme Secret of the World.**

Hermes, Plato, Aristotle, and the other philosophers, flourishing a different times, who have introduced the Arts, and more especially have explored the secrets of inferior Creation, all these have eagerly sought a means whereby man's body might be preserved from decay and become endued with immortality. To them it was answered that there is nothing which might deliver the mortal body from death; but that there is One Thing which may postpone decay, renew youth, and prolong short human life (as with the patriarchs). For death was laid as a punishment upon our first parents, Adam and Eve, and will never depart from all their descendants. Therefore, the above philosophers, and many others, have sought this One Thing with great labour, and have found that which preserves the human body from corruption, and prolong life, conducts itself, with respect to other elements, as it were like the Heavens; from which they understood that the Heavens are a substance above the Four Elements. And just as the Heavens, with respect to the other elements, are held to be the fifth substance (for they are indestructible, stable, and suffer no foreign admixture), so also this One Thing (compared to the forces of our body) is an indestructible essence, drying up all the superfluities of our bodies, and has been philosophically called by the above-mentioned name. It is neither hot and dry like fire, nor cold and moist like water, nor warm and moist like air, nor dry and cold like earth. But it is a skillful, perfect equation of all the Elements, a right commingling of natural forces, a most particular union of spiritual virtues, an indissoluble uniting of body and soul. It is the purest and noblest substance of an indestructible body, which cannot be destroyed nor harmed by the Elements, and is produced by Art. With this Aristotle prepared an apple prolonging life by its scent, when he, 15 days before his death, could neither eat nor drink on account of old age. This spiritual Essence, or One Thing, was revealed from above to Adam, and was greatly desired by the Holy Fathers, this also Hermes and Aristotle called the Truth without Lies, the most sure of all things certain, the Secret of all Secrets. It is the Last and the Highest Thing to be sought under the Heavens, a wondrous closing and finish of philosophical work, by which are discovered the dews of Heaven and the fastnesses of Earth. What the mouth of man cannot utter is all found in this spirit. As Morienus says: "He who has this has all things, and wants no other aid. For in it are all temporal happiness, bodily health, and earthly fortune. It is the spirit of the fifth substance, a Fount of all Joys (beneath the rays of the moon), the Supporter of Heaven and Earth, the Mover of Sea and Wind, the Outpurer of Rain, upholding the strength of all things, an excellent spirit above Heavenly and other spirits, giving Health, Joy, Peace, Love; driving away Hatred and Sorrow, bringing in Joy, expelling all Evil, quickly healing all Diseases, destroying Poverty and Misery, leading to all good things, giving man his heart's desire, bringing to the pious earthly honour and long life, but to the wicked who misuse it, Eternal Punishment".

This is the Spirit of Truth, which the world cannot comprehend without the interposition of the Holy Ghost, or without the instruction of those who know it. The same is of a mysterious nature, wondrous strength, boundless power. The Saints, from the beginning of the world, have desired to behold its face. By Avicenna this Spirit is named the Soul of the World. For, as the Soul moves all the limbs of the Body, so also does this Spirit move all bodies. And as the Soul is in all the limbs of the Body, so also is this Spirit in all elementary created things. It is sought by many and found by few. It is beheld from afar and found near; for it exists in every thing, in every place, and at all times. It has the powers of all creatures; its action is sound in all elements, and the qualities of all things are therein, even in the highest perfection. By virtue of this essence did Adam and the Patriarchs preserve their health and live to an extreme age, some of them also flourishing in great riches.

When the philosophers had discovered it, with great diligence and labour, they straightway concealed it under a strange tongue, and in parables, lest the same should become known to the unworthy, and the pearls be cast before swine. For if everyone knew it, all work and industry would cease; man would desire nothing but this one thing, people would live wickedly, and the world would be ruined, seeing that they would provoke God by reason of their avarice and superfluity. For eye hath not seen, nor ear heard, nor hath the heart of man understood what Heaven hath naturally incorporated with this Spirit. Therefore I have briefly enumerated some of the qualities of this Spirit, to the Honour of God, that the pious may reverently praise Him in His gifts (which gif of God shall afterwards come to them), and I will herewith shew what powers and virtues it possesses in each thing, also its outward appearance, that it may be more readily recognized.

In its first state, it appears as an impure earthly body, full of imperfections. It then has an earthly nature, healing all sickness and wounds in the bowels of man, producing good and consuming proud flesh, expelling all stench, and healing generally, inwardly and outwardly.

In its second nature, it appears as a watery body, somewhat more beautiful than before, because (although still having its corruptions) its Virtue is greater. It is much nearer the Truth, and more effective in works. In this form it cures cold and hot fevers, and is a specific against poisons, which it drives from heart and lungs, healing the same when injured or wounded, purifying the blood, and, taken three times a day, is of great comfort in all diseases.

But in its third nature it appears as an aerial body, of an oily nature, almost freed from all imperfections, in which form it does many wondrous works, producing beauty and strength of body, and (a small quantity being taken in food) preventing melancholy and heating of the gall, increasing the quantity of the blood and seed, so that frequent bleeding becomes necessary. It expands the blood vessels, cures withered limbs, restores strength to the sight, in growing persons removes what is superfluous and makes good defects in the limbs.

In its fourth nature it appears in a fiery form (not quite freed from all imperfections, still somewhat watery and not dried enough), wherein it has many virtues, making the old young and reviving those at the point of death. For if to such an one there is given, in wine, a barleycorn's weight of this fire, so that it reach the stomach, it goes to his

heart, renewing him at once, driving away all previous moisture and poison, and restoring the natural heat of the liver. Given in small doses to old people, it removes the diseases of age, giving the old young hearts and bodies. Hence it is called the elixir of Life.

In its fifth and last nature, it appears in a glorified and illuminated form, without defects, shining like gold and silver, wherein it possesses all previous powers and virtues in a higher and more wondrous degree. Here its natural works are taken for miracles. When applied to the roots of dead trees they revive, bringing forth leaves and fruit. A lamp, the oil of which is mingled with this spirit, continues to burn for ever without diminution. It converts crystals into the most precious stones of all colours, equal to those from the mines, and does man other incredible wonders which may not be revealed to the unworthy.

For it heals all dead and living bodies without other medicine. Here Christ is my witness that I lie not, for all heavenly influences are united and combined therein.

This essence also reveals all treasures in earth and sea, converts all metallic bodies into gold, and there is nothing like unto it under Heaven.

This spirit is the secret, hidden from the beginning, yet granted by God to a few holy men for the revealing of these riches to His Glory --- dwelling in fiery form in the air, and leading earth with itself to Heaven, while from its body there flow whole rivers of living water.

This spirit flies through the midst of the Heavens like a morning mist, leads its burning fire into the water, and has its shining realm in the heavens.

And although these writings may be regarded as false by the reader, yet to the initiated they are true and possible, when the hidden sense is properly understood. For God is wonderful in His works, and His Wisdom is without end.

This spirit in its fiery form is called a *Sandaraca*, in the aerial a *Kybrick*, in the watery an Azoth, in the earthly Alcohol and Aliocosoph. Hence they are deceived by these names who, seeking without instruction, think to find this Spirit of Life in things foreign to our Art. For although this spirit which we seek, on account of its qualities, is called by these names, yet the same is not in these bodies and cannot be in them. For a refined spirit cannot appear except in a body suitable to its nature. And, by however many names it be called, let no one imagine different spirits, for, say what one will, there is but one spirit working everywhere and in all things.

That is the spirit which, when setting incorporates the purity of Earth, and when brooding has embraced the Waters. This spirit is named Raphael, the Angel of God, the subtlest and purest, whom the others obey as their King.

This spiritual substance is neither heavenly nor hellish, but an airy, pure and hearty body, midway between the highest and lowest, without reason, but fruitful in works, and the most select and beautiful of all other heavenly things.

This work of God is far too deep for understanding, for it is the last, greatest and highest secret of nature. It is the Spirit of God, which in the beginning filled the earth and brooded over the waters, which the world cannot grasp without the gracious interposition of the Holy Spirit and instruction from those who know it, which also the whole world desires for its virtue, and which cannot be prized enough. For it reaches to the planets, raises the clouds, drives away mists, gives light to all things, turns everything into Sun and Moon, bestows all health and abundance of treasure, cleanses the leper, brightens the eyes, banishes sorrow, heals the sick, reveals all hidden treasure, and, generally, cures all diseases.

Through this spirit have the philosophers invented the Seven Liberal Arts, and gained thereby their riches. Through the same Moses made the golden vessels in the Ark, and King Solomon did many beautiful works to the honour of God. Therewith Moses built the Tabernacle, Noah the Ark, Solomon the Temple. By this Ezra restored the Law, and Miriam, Moses' sister, was hospitable; Abraham, Isaac, and Jacob, and other righteous men, have had lifelong abundance and riches; and all the saints possessing it have therewith praised God. Therefore is its acquisition very hard, more than that of gold and silver. For it is the best of all things, because, of all things mortal that man can desire in this world, nothing can compare with it, and in it alone is truth. Hence it is called the Stone and Spirit of Truth; in its works is no vanity, its praise cannot be sufficiently expressed. I am unable to speak enough of its virtues, because its good qualities and powers are beyond human thoughts, unutterable by the tongue of man, and in it are found the properties of all things. Yea, there is nothing deeper in Nature.

O unfathomable abyss of God's Wisdom, which thus hath united and comprised in the virtue and power of this One Spirit the qualities of all existing bodies! O unspeakable honour and boundless joy granted to mortal man! For the destructible things of Nature are restored by virtue of the said Spirit.

O mystery of mysteries, most secret of all secret things, and healing and medicine of all things! Thou last discovery in earthly natures, last best gift to Patriarchs and Sages, greatly desired by the whole world! Oh, what a wondrous and laudable spirit is purity, in which stand all joy, riches, fruitfulness of life, and art of all arts, a power which to its initiates grants all material joys! O desirable knowledge, lovely above all things beneath the circle of the Moon, by which Nature is strengthened, and heart and limbs are renewed, beauty in its perfection preserved, and abundance ensured in all things pleasing to men! O thou spiritual substance, lovely above all things! O thou wondrous power, strengthening all the world! O thou invincible virtue, highest of all that is, although despised by the ignorant, yet held by the wise in great praise, honour and glory --- wakest the dead, expellest diseases, restorest the voice of the dying!

O thou treasure of treasures, mystery of mysteries, called by Avicenna "an unspeakable substance", the purest and most perfect soul of the world, than which there is nothing more costly under Heaven, unfathomable in nature and power, wonderful in virtue and works, having no equal among creatures, possessing the virtues of all bodies under Heaven! For from it flow the water of life, the oil and honey of eternal healing, and thus hath it nourished them with honey and water from the rock. Therefore, saith Morienus: "He who hath it, the same hath all things". Blessed art Thou, Lord God of our fathers, in that Thou hast given the prophets this knowledge and understanding, that they have hidden these things (lest they should be

discovered by the blind, and those drowned in worldly godlessness) by which the wise and pious have praised Thee! For the discoverers of the mystery of this thing to the unworthy are breakers of the seal of Heavenly Revelation, thereby offending God's Majesty, and bringing upon themselves many misfortunes and the punishments of God.

Therefore, I beg all Christians, possessing this knowledge, to communicate the same to nobody, except it be to one living in Godliness, of well-rove virtue, and praising God, Who has given such a treasure to man. For many seek, but few find it. Hence the impure and those living in vice are unworthy of it. Therefore is this Art to be shewn to all God-fearing persons, because it cannot be bought with a price. I testify before God that I lie not, although it appear impossible to fools, that no one has hitherto explored Nature so deeply.

The Almighty be praised for having created this Art and for revealing it to God-fearing men. Amen.

And thus is fulfilled this precious and excellent work, called the revealing of the occult spirit, in which lie hidden the secrets and mysteries of the world.

But this spirit is one genius, and Divine, wonderful, and lordly power. For it embraces the whole world, and overcomes the Elements and the fifth Substance.

To our Trismegistus Spagyus, Jesus Christ, Be praise and glory immortal.  
Amen.

---

**Concerning the True Medicine of the Most Distinguished Man,  
Alexander von Suchten, Doctor of Medicine and Philosophy.**

**An Elegy to Charles of Salzburg.**

The Song begun was left unfinished, for he, who was to all as the Sun's light, perished.

The Knowledge of Medicine, by which Podilavius, Machaon, Apollo, and Hippocrates were famous, is not to be sought from Galenus, Avicenna, Mesnis, and other writers of this stamp, but from Magic; and he, who shall have rightly perceived the same, shall at length cure all diseases admitting of cure from death. But Magic has three Books:

Firstly, Theology; Secondly, Medicine; and Thirdly, Astronomy.

Whence the Magus knows and worships Trinity in Unity, and imparts the power he receives from God to suffering mortals. And those, be they Theologians, Astronomers, or Physicians, who shew not by their works what they profess with their mouths, are Caco-Magi and Pseudo-Prophets. By their fruits shall ye know them!

XVII. Positions by which it is clearly demonstrated what a Physician is, and what his Medicine, also by means of what remedies diseases are expelled from human bodies.

1. All diseases, whatever their nature, have their origin, or lie hidden in one of the principal members.
2. Diseases can only be expelled by the generation of good blood in the diseased member.
3. Good blood is generated by the nourishing of the sick member by means of digesting heat.
4. By sickness natural heat is impeded, whereby nourishment digests less.
5. Unless food be digested, blood is not generated.
6. Natural heat, by which everything is digested for sustaining and multiplication of individuals, is the heat of the Sun and Moon.
7. If the heat of the Sun and Moon existing in human bodies be impeded by any diseases, whereby it does its office less effectually, it is to be comforted with the heat of the Sun and Moon of the greater world, or with those things in which is the most potent virtue of Sun and Moon, applied by art.
8. The heat of the Sun and Moon of the greater world cannot comfort the heat of the Sun and Moon of the lesser world except it be conjoined with the same, i.e., be

converted into a simple spirit, like the spirit of life, which is done by dissolving it in nutriment.

9. Nutriment, or that matter remaining in the stomach after the separation of superfluities, is a crude and undigested thing, convertible by natural heat into the substance of our bodies.

10. The heat of the Sun and Moon is extracted, by a wonderful and occult art, from those things through which matter is most simply generated by the great and good God, from the Spirit of the World, for the restoration and conservation of human nature. The same is entirely unknown to Galenus, Avicenna, and all the other physicians of our time, who seek medicines in apothecaries' shops.

11. The spirit of the World and the spirit of our bodies are one and the same spirit. Therefore the heat of the Sun and Moon, generated from the food itself of this spirit, is a thing more decocted and digested, and consequently more perfect, and is called, by Plato Nature of the World, and by Pythagorus Philosophers' Primal Mind, Divine Intellect, Image of Divine Intelligence, Visible Son of God; Orpheus, a most ancient theologian, calls it Jupiter; Dionysius, a disciple of St Paul, names it a Visible Image of God.

12. For that heat is a most perfect spiritual entity, the greatest among all God's creatures, and the nutriment in the stomach is the imperfect, corporeal matter, undergoing transmutation.

13. Therefore we have here a task which, in some measure, has reference to both, viz., Solar and Spiritual Heat, and Material Nutriment, which medium is also called by philosophers the Fifth Essence.

14. The heat of Sun and Moon, Fifth Essence, and Nutriment, when thus mixed in our bodies, produces the purest blood in which is heavenly virtue, freeing us from all disease, which nothing else in the whole world can do. For there are in this compound the virtues of all celestial and terrestrial bodies, so that the whole world is present in one drop of this same medicine.

15. The Fifth Essence alone, by the aid of the physician, brings about durable health, which physician, however, is not Galena, nor Avicenna, nor Rhasis, nor Mesne, nor Serapio, but the same heat of Sun and Moon, the treasure of the wise, and inestimable glory of the whole world.

16. The Fifth Essence is neither known by apothecaries nor sold in their shops. Therefore, apothecaries prepared not medicines, but rather poisons, with which they corrupt the complexion of the human body.

17. The heat of Sun and Moon is not to be met with in the Schools of Bologna, Padua, Ferrara, Paris Louvain, or Wittenberg. Therefore, Doctors of Medicine graduating there are not physicians, but impostors and cheats, who, entering the temple of Apollo, not by the door but through the roof, occupy his seat, even as did the Scribes and Pharisees the seat of Moses.

Therefore, not without cause do those whose intellect is obscured by the precepts and traditions of fools, and are hence unwilling to follow the wise, knowing the secrets of Nature, and curing so-called incurable maladies by natural means, accuse them of having a devil. For if they owned that these cures had been effected by means of that Medical Science, the very threshold of which they have never crossed, then doubtless all men would know them to be no physicians, but impostors and shedders of human blood.

Christ, Theologian, Astronomer, Physician.

To Christ alone be Glory.

Amen

## Man, the Best and Most Perfect of God's Creatures

### A More Complete Exposition of this Medical Foundation for the Less Experienced Student.

Aristotle says that every form of every nature, animal, vegetable, and mineral, is produced by the power of matter, intrinsically, except the Human Soul, which, being of a different and higher nature than matter, is given, extrinsically, by the Prime Motor, God Himself. It is this thing concerning which, all theologians and physicians disputing, nevertheless mostly conclude the Soul of man to be not produced from a germ, but, as it were, to be inspired and poured into the foetus in its mother's womb, by God the Author of all life.

But, since two different things cannot be mixed or joined into one, and the Soul being a certain Divine light and substance, emanating immortal from Divine springs, so produced, incorporeally, that it is dependent on the virtue of the Agent, not on the bosom of matter, the same is a primum mobile, and, as they say, spontaneous and self-moving: And, on the other hand, the Body is wholly earthly matter, having its origin in gross, rank. Elementary matter, mortal of itself, unfit for motion, and therefore far inferior to the Soul; wherefore it can never be united to the Soul, so different from itself, except through a third, a medium participating in the nature of each, a quasi-body and quasi-soul, by which the Soul may be added and joined to the Body.

But such medium they suppose to be the Spirit or Soul of the World, i.e., what we call Fifth Essence, because it consists not of the four elements, but is a certain fifth one, above and beside them. Such Spirit necessarily requires, as it were, a binding chain,

whereby Celestial Souls may bestow on grosser bodies strength and wondrous gifts; as also God and Man cannot be united except through a Medium, our Savior Christ, participating in the two natures, Celestial and Terrestrial, Divine and Human. But this spirit is of the same form in the greater world as in the lesser, i.e., the human body, our spirit, which arises from the former, and is with it one and the same spirit.

For, as the forces of our soul are through the natural spirit applied to the members, so is the virtue of the World's soul diffused through all things by the same spirit, or fifth essence. For the life and forces of all inferior species, which philosophers are wont to call souls or lives, are distributed by that ethereal or celestial spirit throughout all the elements, as it were, by the members, into the body of the Universal World, first by God Himself, then by intelligent beings, then by the stars, and lastly by the Sun, as it were the Heart of Heaven. And again, this Spirit being taken away, bodies return to that whence they came; and thus the Human Soul, according to the Platonic School, proceeding from Highest Heaven, from God Himself, is, by proper media, joined to our viler body. In that first descent, also, the soul is enfolded in the ethereal and ardent corpuscle which they call the ethereal vehicle of the Soul, while we name it the Spirit of the World and Fifth Essence. Through this medium, by command of God, Who is the Centre of the greater world, the Soul descends and is poured into the heart, which is the center of the lesser world i.e., the human body), and from thence is diffused through all the parts and members of its body, when, joining its vehicle (or chariot) to natural heat, through the spiritual heat born in the heart, the Soul is immersed in the blood, and by it equally diffused in the members. Thus it is patent how the Immortal Soul is enclosed in this viler body, viz., by means of the ethereal vehicle. But when the bonds between the Celestial Soul and natural vital spirit are loosened by disease, then the Soul, withdrawing from the members, flows back to the heart, the first receptacle of Soul and Life. From the heart, the Soul, leaving the vital natural spirit, flies away with its vehicle into the Heavens, when, being followed by guardian genii and demons, they lead it before the Judge. Then, according to the Sentence, God joyfully conducts the good souls to glory, but a raging demon snatches away the bad to punishment. And the Body returns to the earth whence it came. Thus man dies. Hence it is plain that the daily preserving of the Soul in the body --- that is, our life --- and the avoiding of diseases, and that the greatest dissolution of Soul and Body, called death, depend on the vehicle of the Soul, viz., the Celestial and our natural Spirit, and so the same has been by various authors called by different names. Some term it Spirit or Soul of the World, others Celestial Fire, others again Vital Spirit, Natural Heat, by which nothing else is denoted than that oft mentioned Spirit of things celestial and inferior, the gluten of Body and Soul. On examining the thing more fully, this is simply the heat and humour of Sun and Moon, for we know the administration of the Heavens and all bodies under the Heavens to be appointed to the Sun and Moon; the Sun is the Lord of all virtues of the elements; the Moon, by virtue of the Sun, the mistress of generation, of increase and decrease. Hence Albumansar says that life is poured into all things through the Moon and Sun; and therefore they are called by Orpheus the vivifying eyes of Heaven. Whence also the saying --- the Sun and man generate man; for the Sun sits as a King among the planets, in magnitude, beauty, and light excelling all, illuminating all, dispensing virtue to them as well as to inferior things, and abundantly bestowing light and life, not only in Heaven and the Air, but also in the earth and profoundest depths of the Abyss. Whatever good we possess is from the Sun whence Heraclitus deservedly calls it the Fount of Heavenly Light, and many of the Platonic School have located the World's Soul principally therein, which

Soul, filling the Sun's whole globe, pours its rays (or spirit) everywhere, throughout all things, distributing Life, Sense, and Motion to the Universe itself. And as in animate beings the heart rules the whole body, so does the Sun rule and govern Heaven and Earth and all that in them is. But the Moon, the Earth's nearest neighbor, by the velocity of its monthly course, is joined to the Sun and other planets, and receiving their rays and influences as in an espousal, and, as it were, bringing forth, communicates to and shed upon its near neighbor, the earth, all life and motion.

From these two founts arises that mundane, natural, and vital spirit, permeating all entities, giving to all things life and consistence, binding, moving, and filling all things, Immense Renewer in Nature's charge, through whom, as a mediator, every hidden property, every virtue, all life, are propagated in inferior bodies, in herbs, in metals, in stones, in things inanimate, so that, in the whole world, there is nothing wanting in a spark of this spirit. For it is in all things, penetrating through all; it is diffused in stones (being struck from the same by steel); it is in the water (which smokes in ditches); and in the earth (which heats springs and wells). It is in the depths of the sea (becoming warm when agitated by the wind), and in the air (which we often perceive to grow hot); also all animals and all things living are nourished by heat, and all sentient beings do live by reason of their latent heat. Whence Virgil says this inward principle nourishes heaven and earth, the sunlit plains, the glowing orb of the Moon, and the Tithonian Stars. The same is elsewhere called: That Vigour and Celestial Origin. Therefore this spirit, when whole and undiminished in our bodies, and not impeded by things extraneous, is our natural heat, by which everything is digested for the sustenance and multiplying of individuals.

For it digests man's food, generating good blood in all his members. Now, with pure blood there is a strong, pure, and healthy vital spirit of the heart, and thus the whole body is healthy. But if, by some impediment, it does its office less fully, there arises bad decoction of nutriment, whence generation of impure blood. By this the heart's vital spirit is weakened, whence arises old age and, at length, full extinction, consumption, and dissipation of that spirit, which is natural death. Therefore, to avoid this, the said spirit and natural heat, thus diminished, or impeded, must be increased and comforted that it may better and more strongly perform its functions. But as agents act not with inferiors but with equals, so also must this comforting take place through the spirit's equal, viz., through the celestial heat of Sun and Moon and other planets, or with those things in which the virtue of Sun and Moon are most potent, abundant, and least bound up with matter. For these things act more quickly and effectually; they generate their like more promptly, and from them is more easily obtained that Spirit or Celestial Fire whose properties are heat, not consuming like the elementary, but fructifying all things; and light, bestowing life on all things. But the properties of elementary and inferior fire are burning, consuming all things, and filling them with barrenness and darkness. Therefore is the same excluded, as also all other inferior and elementary subjects. For all these things of natural composition, and not freed from grosser matter, are subject to corruption and transmutation. Now, medicines ought, all the more, to be durable and free from corruption, since they are to cure the human body from corruption; otherwise they would do more harm than good. I add that it would be vain to preserve the corruptible body by a putrid and corruptible thing, or to attempt to heal an infirm nature with a thing infirm, or yet to fashion a thing by deformity. For the corruptible, infirm, and weak added to its like increases the corruptibility and does not diminish it. Thus we see many, and even

most, of the physicians of our time in vain attempt to heal, and secure immunity from disease, by means of the crass and corporeal compositions of their medicaments. But this speculation goes farther. For all diseases which are spiritual, not corporeal, also demand spiritual medicines. Therefore, to those wishing to preserve that vital spirit in the young (which is the humid and warm radical), to restore the lost powers in old men and to bring them back, as it were, to youth, and to educe to their highest perfection the powers of man's life, I would say that such will do well to seek, not the Elemental, but that Celestial heat of the Sun and Moon, dwelling in a more incorruptible substance, under the Moon's intermittent orb, and to make this similar to our heat or spirit; so that, prepared as medicine and sweet food, when taken into the mouth it may immediately penetrate the human frame, greatly holding to itself every fleshly thing, increasing, restoring, and nourishing the incorrupt virtue and spirit of life, digesting the crude and undigested, removing the superfluous, making natural water abound, and augmenting, comforting, and inflaming natural heat or fire.

The above will be the duty of the true physician and sane philosopher. For thus will he be able to preserve our body from corruption, to retard old age, retain florid youth in full vigour, and, if possible, to perpetuate it, at least to preserve it from death and destruction. But here we speak of natural death philosophically, which is only a natural consumption of moisture and heat, as is demonstrated by a lighted lamp; not theologically, of that fatal death and last end of Nature destined by God for each one, by which we are compelled not only to pay our debts, but also, by reason of our sins, to suffer punishment. For we know that, for his sins, man must once die, Job saying: "Seeing his days are determined, the number of his months are with Thee; Thou hast appointed his bounds that he cannot pass", --- which text plainly sets forth that these bounds, once constituted by God, cannot be passed by human aid or skill; for which cause also Adam was driven forth from the paradise of Joy, lest, after the Fall, he should become equally as immortal as before by eating of the Tree of Life. Neither is it credible that, outside Paradise, God should have given Adam anything whereby he and his descendants might live for ever, when by the very expulsion he forthwith deprived Adam of access to the Tree of Life. Therefore no aid can be found, still less invented, beyond those last bounds set us by God. On the other hand, there is a remedy against many infirmities, and against the weakening of radical moisture and innate heat.

For Adam, created by God full of understanding and perfect knowledge of natural things, doubtless knew those which were capable of prolonging human life and securing immunity from disease. Doubtless he also taught the same to some of his descendants, and they again to others. Hence many of the fathers lived to the age of 700, 800, and more years; but some did not live so long, this secret not being revealed to all.

Therefore it is conceded that (on this side of that limit of death) there may be found something to restore our sick body. For just as man, through disease and other causes, often fails to reach the appointed limit of life, so, on the other hand, by removing these impediments, he may prolong life to the very utmost limit set him.

But some may affirm that such a medicine cannot be found in the whole sphere of this nether world, because all things created, being either elements or composed and congenial with them, are therefore corruptible, and hence that this medicine and

incorruptible root of life can nowhere be found. Those speaking thus learnedly, without having ever entered the Sanctuary of Nature, fail to consider there is in the elements something besides corruptible qualities. For the elements and their compounds, in addition to crass matter, are composed of a subtle substance, or intrinsic radical humidity, diffused through the elemental parts, simple and wholly incorruptible, long preserving the things themselves in vigor, and called the Spirit of the World, the one certain life, filling and fathoming all things, so that from the three genera of creatures, Intellectual, Celestial, and Corruptible, there is formed the one Machine of the whole world.

This Spirit by its virtue fecundates all subjects natural and artificial, pouring into them those hidden properties which we have been wont to call the Fifth Essence. We do not say that Medicine is quite as incorruptible as Heaven (or I could not in the stomach be converted into nutriment), but being generated from matter above all others and incorruptible with respect to them, and simply formed by the separation therefrom of all corruptible elements, it could be kept, if necessary, 10,000 years.

For this cause skillful physicians advise us to use less incorruptible (indigestible?) food. This thing has the same bearing with respect to the four qualities of our Body as Heaven has with respect to the four elements. For Heaven is called by philosophers the Fifth Essence with respect to the four elements, because Heaven is in itself incorruptible, immutable, not receiving foreign impressions, unless acting on the elements by God's command.

Thus the whole thing we seek is, in relation to the four qualities of our body, a Fifth Essence, incorruptible in itself, made by art. It is not hot and dry like fire, for it cools hot things, diminishing and expelling fevers; nor does it cool humid things like water, for it burns, which is repugnant to the element water. Nor, again, does it moisten hot things, like air, for it corrupts not like air, which is easily decomposed, as we see in the generation of spiders and flies; nor is it cold and dry like the earth, for it sharpens and warms. But it supplies to each a contrary quality, like unto the incorruptible Heaven, which, according to necessity, furnishes the hot, cold, moist, or dry quality, and just as Supreme Heaven does not by itself alone preserve the world, but through the virtue of the Sun, Moon, and other Stars, so also does this our Heaven, or Fifth Essence, wish and deserve to be adorned by a splendid, wondrous, and occult Sun, from which it has incorruptibility, virtue and heat.

But this is the root of life, i.e., the Fifth Essence, created by the Almighty for the preservation of the four qualities of the human body, even as Heaven is for the preservation of the Universe. Therefore in this Fifth Essence and Spiritual Medicine, which is of Nature and the Heat of Heaven, and not of a mortal or corrupt quality, is indeed possible the Fount of Medicine, the preservation of life, the restoration of health, and in this may the cherished desire for the renewal of lost youth and serene health be found. For, briefly, in the whole world there is no better medicine than this. Even as in every genus there is something holding the first rank in that genus, so also this medicine, being prepared from the most efficacious and incorruptible matter under Heaven, viz., from the Soul and Spirit of the World, containing within itself the virtues of all things celestial and terrestrial, will hold first rank among medicines, and man, by using the same, together with other food, in moderation, may attain to the age of the Patriarchs. For of this composition, combining as it does the virtues of all

things, there may truly be said that in one drop the whole world is present. It is this most famous medicine which philosophers have been wont to call their Stone, or Powder. This is its fount and fundament, and the Medicine whereby Aesculapius raised the dead. This is the herb by which Medea restored Jason to life. This is the secret substance brought from Colchis by the Argonauts under Jason with so much journeying and pains, and hence called the Golden Fleece; partly because this Science excels in virtue all others, as the Sun does the stars and gold the other metals; and partly because that Fleece was a Book written with golden letters (according to the testimony of Suidas, Historiographer of the Chemical and Medical Arts) and containing a full account of the preparation of the Medicine. For in that Book is the first material for the creation, restoration, and preservation of our most true Medicine.

Chemistry can be easily understood by the intelligent, and chemistry, i.e., altering metals, may properly be including in the teaching of the theory of the True Medicine aforesaid, both flowing from the same fount, namely, the World's Soul, which, being as it were, the only life of things, and the author of generation, will contain within itself the seeds of all inferior natures.

In harmonious order it rules, vivifies, and fecundates. But, for younger disciples, it has pleased us to describe somewhat more fully the principles of chemistry, which each one may easily prove for himself. For, when he has considered the matter, he will perceive that God would be compelled, perpetually and each moment, to create new creatures, lest the species of all things in that beautiful house, the universal world, should perish entirely, had He not, when breathing the breath of life into man and all other beings, at the same time given them the command: "Increase and multiply in the earth". By which breath and command He imparted unto them not only natural life, or a living soul, but also the power, which may be called the generative spirit, whereby every genus may preserve and perpetuate its race eternally. For everything which may generate is necessarily alive, as, on the other hand, that having life, unless prevented, will generate. Therefore, at the Creation the generative spirit began the order of continuous production which shall only cease with the world. Hence God commanded Noah to build so great an Ark that it might receive and save from destruction some of each species and both sexes, which, after the Deluge, should again propagate their kind.

And everyone attentively observing the universal world will doubtless perceive this perpetual order of generation everywhere, not only in these crass, inferior, elementated bodies, but also in the simple celestial bodies and in the elements themselves. Elements generate their own kind, as we are taught by the infallible rule of daily experience. A fire converts the matter it consumes into its own nature, viz., fire, thereby augmenting itself. Air does likewise, easily corrupting things and dissolving them into air like itself. Earth, foul and dissolved, becomes water; the latter through heat made gross and dense, becomes earth; but evaporated by heat, is changed into air, and this again, by overheating, into fire. Fire, when extinguished, returns to air, cooled air becomes water, and that again, by coagulation, earth. But the natural order of generation is more plainly perceived among inferior and composite bodies, which philosophers have divided into the three orders: Animals, Vegetables, Minerals. For these have their own seed, implanted by Nature herself, by which they manifestly and visibly produce similar fetuses, thus augmenting their kind by propagation, From horse, man, bull, are respectively generated horse, man, and bull. Likewise all

vegetables, herbs, trees, shrubs, cast their own seeds on to the ground, which, in course of time, produce species similar to themselves. Indeed, the minerals and metals lying hid in the very center of the earth have also undergone the same changes, although their seed and generations are not visibly shown, as in the preceding orders -- for, by reason of the great mass of the earth concealing the hidden, contained seed, the same is by many believed neither to grow nor to generate.

But the attentive observer of Nature, its origin, increase, and incrementation, will certainly not dispute its possession of vital spirit and generative power, by which it not only originates and has nutriment, life, and consistence, but also must be admitted to possess the power of generating its kind. For everything increasing, originating, growing, and receiving nourishment has vegetative life, hence propagating power. And the reason of the generation of minerals being so patent to the eye as that of vegetables and animals, is the earth's great and abundant fecundity, its vast mass, by which that spirit is restrained and impeded as in a prison and chains, by which it can less perform its functions and generate its kind. The same when freed by art from its terrestrial house and sepulcher, doubtless, like others, sharers of generative virtue, will be able to bring forth fruit by its seed, and thus metal will produce metal and gold generate gold.

From this it is manifest that the generation of metals, and especially of gold, is not only permitted by God, and possible to Nature, but also to human art. Consequently the Art of Chemistry is not fictitious, not detestable, not base, as today it is falsely called by many, but true, admirable, holy, and well proven. For by natural means seeding out the invisible, impalpable, generative spirit, elsewhere called the Seed of Metals, it so treats the same that it bears fruit similar to itself, etc. Therefore, many philosophers, moved by this argument, have sought that golden seed in gold itself; and having found what they wished, have cut out, or extracted, the same from a mass of gold. As it were, from the stones placed by Nature about it, which, being thus separated, and afterwards applied by them to anything of a similar nature --- i.e., any metal --- has immediately changed the same into gold and silver. Hence they have proved by experiment that gold can generate its like, but have thereby gained no lucre or emolument. For this spirit, or seed, of gold, when mixed with any of the other metals, can convert into gold only a quantity equal to the gold whence the seed was extracted, and not more. Hence the process was a tedious and most difficult one, requiring much time and a large outlay. That, therefore, this generation and manufacture of gold might be carried on more easily and abundantly, with less expense and yet more profit and utility, the Ancient Sages were compelled to relinquish common gold, and, with the spirit of which we in this place treat, viz., the generating spirit of all creatures, were forced to seek a method of making gold elsewhere; in respect of which they spared neither labour, nor time, nor expense, and at length arrived at one thing in which all their wishes were fulfilled, for they obtained a nature, or body, or certain compound, in which the metallic, gold-producing spirit was unlimited and unstraitened, not limited in quantity proportionate to the matter, but so intense, exuberant, possessing more of form (essence) than of matter, that, by artificial fire, it may be reduced to its greatest purity, and may be so treated, diffused, extended, and multiplied that, after completion, it is a thousand thousand times stronger than bodies naturally perfect, i.e., gold and silver. --- For the more form a thing has, the more entity, virtue, and operation it has. Those things in which the idea (which is the form) is least merged into the body, or matter, have the most potent

virtues, because being the most formal (spiritual), they can with very little matter effect very much. This matter thus formed and taken possession of by all sons of this science, lest it should become known to the unworthy, and equally that it might be known by the worthy, we read of as described by the sages in divers enigmatical ways only to be understood by the initiated. The following are some of the principal circumlocutions designed indirectly to make known this great secret: What is the strongest creature in the whole world, the most conservative, most penetrative, most volatile, the most unalterable and fixed in fire? The thing that fire has not touched is accessible and known to all men, of much superfluity, to be found everywhere, and by all. It is a part of man, begets and is begotten by man, is heavy in weight, soft (or at least not hard) to the touch, not rough, sweet to the taste but of a sharp nature, sweet to the smell but at the same time having a fetid and sepulchral odour, pleasant to sight and hearing, yet of obtuse sound, not the less fire for being almost wholly earth, nor yet simply water, neither very acute nor obtuse but mediocre in quality, revealed by reflection, various in colour, white, black, and last red, most easily fusible, and also of metallic fusion, without much sound, in action animal, vegetable, and mineral. It is a thing which the earth produces and which descends from Heaven, both active and passive, masculine and feminine, consisting of Soul, Spirit, and Body.

It is the one subject of everything wonderful in Heaven and Earth, without which neither Alchemy, Medicine, nor Natural Magic can exhibit their complete aim. It is also the first and last, greatest of all creatures, by most commonly called red, or Adamic Earth. From these and similar attributes, or circumstances, and in no other way, may this matter be known and prepared by a proper, natural method, at length excelling in that naturally desired by all, and pursued by all with great eagerness, viz., daily and healthy life, without all infirmity, until natural death. And it will further afford gold, silver, pearls, gems, and such precious things, as well as all that is necessary to the honest sustenance of life, abundantly and affluently. Thus the object of Chemistry is identical with that of Medicine, the same Spirit, same Heat, same Quintessence, the same Soul, Medium of Nature, which permits one thing to be converted into another; finally there are the same uses, rewards, and emoluments for the disciples of either science who shall have known how to separate this Quintessence from its defilements and impurities, and to reduce it to pure simplicity. For he who shall have been able, from its impure and manifold elements, to convert it to purity and simplicity, discerning the nature, virtue and power of these elements in their number, degrees and order, without division of substance, the same is truly a Physician, natural Magus, and consummate Philosopher. For by the same heat of Sun and Moon, the same Spirit of the World, by which human bodies are healed from infirmities and accidents, he can restore imperfect or impure metals to True Health --- which is Conversion into Gold --- and his he will have thoroughly discovered the whole virtue of Nature's occult operations, and will easily obtain a perfect knowledge and grasp of all natural and celestial secrets. On the other hand --- if ignorant of all these things --- he can attain to no knowledge of such wonderful agencies.

Hence it is plain that this art, and most secret of Nature's secrets is in vain attempted and sought by those who daily join themselves to princes and magnates, and immediately attempt Hermes' Stone, the Sacred Stone, Philosophers' mercury, all kinds of furnaces and burnings, strong waters, King of Antimony, perpetual fire, and many more inept things of that sort, and, with this gullible art in their mouths, [promise whole mountains of gold; knowing, nevertheless, not a single word of Latin,

and still less having tasted a single drop from Nature's hidden founts. For unless one be instructed in the discipline of the great arts, he can become but little proficient therein. Wherefore the above has been collected from Natural, mathematical, and Supernatural Precepts, etc.

---

*Here follows the Practice --- which, however, is wanting owing to the sudden death of the Excellent author, A.V.S.*

## **A Dialogue**

**By**

**Alexander von Suchten**

Doctor of Chemistry and Famous Philosopher.

Introducing Two Interlocutory Personages, viz., Alexander and Bernhardus.

*Alexander:* That is the cause of my departure. I therefore beg you to give me the good counsel you have already been asked for by me.

*Bernhardus:* Why do you, an old Physician and Chemist, allow yourself to be misled by the popular cry? Know you no the way of the world, that he who praises not himself has no consideration? The popular cry should not have moved you to leave wife and child at home, wandering about and seeking in other lands what you might perhaps have found sooner and better at home. For old acquaintance sake, I will not refuse you the desired counsel. For, as you say, we were good friends in Italy, at Padua, Ferrara, Bologna, and Rome, when seeking there what we did not find. But, before I speak further with you, tell me what god you have experienced and learned at Basel, Cologne, in Switzerland, on the Rhine, in Silesia, in the marches (Brandenburg), and in Denmark, where you were with the Paracelsian doctors?

*Alexander:* As I came to them, so I left them; what they told me I had already read in Paracelsus, where he speaks of Flowers of Antimony, of Matter of Pearls, of Juice of Coral, of the virtues of hellebore, of Potable Gold, and of the Quintessence. But I thought to hear from these learned persons what Paracelsus means by those names and terms. For I had long remarked that his Vitriol and Tartar were not sulphuric acid and common tartar; and so on with the other names. But I saw the good gentlemen still read it literally. Hence I did not learn from them the mysteries hidden by Paracelsus under the said names. Each one has his preparations, highly praised by himself; but I ask not for preparation, knowing that in the things prepared by them there are not the secrets sought by us. I have spent much time and labour over the substances they occupy themselves with, which they, as Chemists of the new School, hold in great honour. But I think nothing of all that, as they also will find out in time. Hence you can easily guess what I have learnt from them.

*Bernhardus:* But I hear they do much with their Chemical medicines?

*Alexander:* Yes, as luck would have it, sometimes much, sometimes little; as also happens with us Galenian doctors, Paracelsus writes that Medicine is a certain art, which a physician must be as fully master of as a tanner of his trade. He says not it is easier to learn than the tanner's trade. But such perfection have I found in none, and

they all speak of different things and long labor. What shall I, then, think of these professors? I know you have earnestly occupied yourself with the secrets of medicine of the last 27 years, and I pray that you do not refuse your old true comrade what you, in that long period, have learn concerning these hidden matters.

*Berhardus:* Vitriol, Tartar, Coral, Pearls, Jewels, are not that upon which the medicine of Paracelsus is built. For the first philosophers and inventors of medicine have spoken concerning weighty things in parables and other figures of speech Thus also Paracelsus, who, in his teaching, has invented some names, having received others from the Ancients --- excepting some in which Medicinal Virtues, but not perfections, are found. Marvel no that Paracelsian doctors take the similitude for truth.

*Alexander:* But I have left home to discover the same, yet have found no one to teach me. I well know there is something in Vitriol, also in Tartar, Antimony, Mercury, but find not in them what Paracelsus ascribes to them.

*Bernhadus:* Perhaps you know not the proper preparation of these substances.

*Alexander:* Bother the preparation! I see others do as little with their preparations as I with mine; therefore, there must be another reason for it.

*Bernhardus:* Have you read the chapter in Paracelsus concerning Dropsy? Therein you find the simples which may help to cure your brother of this complaint.

*Alexander:* Certainly, I have read it more than once, but what simples are there in it other than Mercurium Columbinum, Crocus, Sulphur, the Element of Fire, and Diaphoretic Gold? I would not put Mercury sublimated, precipitated, sublimated, etc., into my brother's mouth, neither would I Sulphur; and when I apply Columbinum, or Gallinaceum, and other poultices, according to our custom, they are of no avail. What Element of Fire is I know not. I do know that Diaphoretic Gold, as Alchemists make it, with Mercury, acids, oil of salt, and with urine, is a poison – and tat the Diaphoretic Gold of Paracelsus mus be something else. Are Crocus and Sal Martis burnt iron, which us used by the doctor for restoring health?

*Bernhardus:* I plainly perceive that since you have taken a wife, are laden with domestic cares, and are practicing according to the Galenian method to keep a family, you have ceased to reflect on these matters.

*Alexander:* I must make shift with Galenian Medicine until I can get a better master. Nevertheless, I always am working and seeking the arcane, but I have hitherto had little success; why, I know not, for I am not wanting in diligence.

*Bernhardus:* I will tell you, God is a Searcher of all minds, and Medicine is in His hand: He grants it according to our heart. When we were at Padua I know you took the opinions of Galenus for Gospel, that you graduated in the same, and that you then went with some other doctors to Friaul, there to try the new medicine. But what happened to you and your comrades? You thought you had collected from your professors the golden fleece of medicine, --- no disease could resist you. Then you found that your fleece was nothing but asses' figs, and the peasants who ate the same died, or were ripped and lamed. Do you remember what a quarrel you thereupon had

with your preceptors? But what answer did you get? That you were only a young doctor; that Practice was not so easily learned; that you must exercise yourself therein, and go on killing people, and at last you would become a clever doctor. That is also the experience of others who get their medicine from the universities. Hence it is a Gift of God, and comes not from Padua, Paris, or Wittenberg. He Himself has created and compounded medicine, not Galenus, not Avicenna, not Paracelsus, but He alone, and from Hi we must learn the Truth --- not from this or that author. Each one has written according to the measure of Truth he has found. We may, therefore, take them for guides, but not for the way itself, as we did when spending our youth so uselessly at the High Schools. Since Galenus knew and described medicine, and his professors made a physician of thee, tell me, when thou seekest information from others, what does Paracelsus concern thee?

*Alexander:* Everyone knows that Paracelsus was a learned man who has written many clever things, but he invented not Medicine himself, having received it from Hippocrates and others. Therefore, God has bestowed upon him great understanding, whereby he has brought Medicine into a right order and one method, through which it has acquired a reputation no possessed by it before. Hence Galenus is so highly considered by the learned, and alone taught in the Schools. The reason for my having go into the Medicine of Paracelsus is this: I have long been a Chemist, seeking that which others seek, and yet I cannot attain it, but find in Paracelsus that, by Alchemistic preparation, medicine should be made to act. I have also in High Germany heard of incredible cures effected by Paracelsus --- as his Epitaph also testifies --- and, therefore wished to make use of my chemical studies in preparing medicaments, thinking to discover the secrets of medicine of I might not make gold and silver. For I cannot deny that, since we have mighty principles and authors of our medicine, and yet can do so little in dangerous sickness, we must be, for some cause, deficient in medicine.

*Bernhardus:* Yes, truly, a great deficiency. You write and chatter much, and when at the patient's bedside, you cannot drive away a fever. You purge, anoint, and poultice in vain, putting hi off with fine words and dieting, until Nature herself overcomes the disease; then you have excellently shown your skill. But if he dies, killed by your quackery, the disease was incurable. What shall I say of other maladies ore serious than fevers? As you understand and treat the one, so you so the others. Tell me, on your conscience, can you, with your Galenian method, drive away a fever?

*Alexander:* I cannot do so with certainty. A doctor is but the minister of Nature, not her master.

*Bernhardus:* We know well that Nature herself is our medicine, and that she helps the sick person when the impediments are removed. With respect to these impediments we must assist Nature, but I have never seen one who could cure a fever, without fail, in a certain fixed time.

*Alexander:* I have known one, but cannot sufficiently wonder at the medicine.

*Bernhardus:* What think you is the cause that you Galenians cannot do so?

*Alexander:* That our theory has a false foundation I cannot assert, but must confess that the result does not correspond with the principles.

*Bernhardus:* Were the principles good, the result also could not fail to be so. But your principles were invented by phantastic, unlearned scatterbrains, who knew not Nature.

*Alexander:* You must not thus despise the famous and praiseworthy doctors; they are, after all, very learned men.

*Bernhardus:* I despise no one, but it is my duty to rescue the Truth. As the Greeks say: I am a friend of Socrates and Plato, but still more so of Truth. If Nature have not taught their principles, they are learned but with their own sort.

*Alexander:* Not only with their own sort, but at the courts of Emperors, Kings, and Princes, and with many honest men.

*Bernhardus:* Your citing mighty Potentates only shews they know nothing about Medicine; if they did, you would soon have other news.

*Alexander:* High Potentates of Christendom have other things to do; hence they have learned person to serve and help them.

*Bernhardus:* Yes, certainly help them --- from this life into the next. I could tell you something about Princes, did I not wish to spare the heads of those who have driven them from one illness into another, and, at last, even killed them. I myself have been present when a young prince was sick, and not knowing what to do, one of them said: Let us proceed according to the method and we shall be excused. How like you this advice? Your method must be right, should every prince give up the ghost under it. What says Paracelsus of the physicians of the Emperor and great lords? Does he not declare that they know less than peasants, rather helping their princes to death than to life, and that, having such physicians, it is impossible for them to reach old age? Have you never heard a prince lament: This multitude of physicians has destroyed me? Also, what said the Emperor Adrian when about to die? The concourse of physicians frequently changes the Emperor! But what sort of doctors were these? Just the same who the Burgomaster of Rome drove away and forbade the city. The truth about medicine was not discovered at that time, when the phantasy concerning humours was believed in.

*Alexander:* From the beginning of the world this Medicine has been held in high honour; that it should now be brought into contempt and replaced by another is difficult to believe.

*Bernhardus:* Adam, our first father, who had knowledge of all arts, also received that of Medicine from God, and it was kept secret by the learned (as the great gift of God) until Noah's time. When God destroyed the world by the Flood, the art of Medicine, with many other controlled arts, was lost. No one remained who knew them except Noah, called by some Hermogenes, or Hermes, to whom Antiquity ascribes the knowledge of all things celestial and terrestrial. The same Noah, before his death, described Medicine, skillfully concealing it among another matter. After his death this

knowledge returned to God, and thus, through the Flood and Noah's death, was taken away from the Human Race.

*Alexander:* Who can believe God to have been so ungracious to man as to have taken from him this knowledge of Medicine?

*Bernhardus:* Tell me, does God think more of our Souls' salvation than that of our mortal bodies?

*Alexander:* Doubtless most of that of our Souls.

*Bernhardus:* Why, then, has he concealed Salvation during the 5000 years before Christ was made man? When Christ was revealed to the world, then men heard the news of their Salvation, and there fell to the ground hundreds of idols, raised by men according to their own imaginations, although they knew not what was their souls' salvation. For the notion of the Deity is naturally innate in man, which is even a better idea than knowledge; by which is incited the natural desire of good, reasoning, and judgment. Thus do idols spring from the imagination of men. And, forasmuch as human reason, the origin of philosophy, of which Erastus and writers of his stamp boast much in our time, need not necessarily be without deceit and guile, it has always fallen short of the truth until God assumed human reason through the mind, and His Word became flesh and man. It is not possible for our Reason --- although mind --- to grasp the Truth, until our intellect has been lighted by God's Word, and Reason receives Divine Illumination through the mind, which then took place when the Word became flesh and dwelt in us. Before that time Theology was man's vain suppositions (I speak not of the few enlightened by God through the Holy Ghost before the incarnate Word), and he understands not his soul's salvation. If God has concealed the same from humanity for 5000 years, is it incredible that he should withhold the body's salvation --- i.e., Medicine --- for 4000 years?

*Alexander:* If Medicine, as you say, has only appeared in our own time, whence comes the medicine which has been practiced during the last 4000 years?

*Bernhardus:* Whence came the idols which, before Christ, were in Europe, Africa, and Asia? Our human reason has speculated them out, and thus also has it happened with Medicine. After Noah's time, men, harassed by diseases, sought refuge, one in herbs, another in animals, a third in stones and metals, and thus one thing after another was tried, without full knowledge of the same, which had some appearance of virtue. But there was as yet no doctor. The sick were carried to some public place, those who had had similar complaints shewing them the remedies used by themselves, which the patients tried on chance. Such was Medicine until the time of Apollo, i.e., 1915 B.C. This Apollo was a clever and learned man, and carefully noting those things which proved efficacious in diseases, he began to visit the sick, and thus became a public physician, to whom, after his death, a temple was erected and divine honours were paid. In such honour was medicine then held which today begs its bread. Aesculapius succeeding his father, also treated the sick with skill and knowledge inherited from his father, and to him there was a temple erected, as to a god. After his death the kings commanded that all medical discoveries and observations should be written down and publicly exhibited on the walls of the Temple of Aesculapius. 457 years after came Hippocrates Cous, who was commanded

to arrange the experiments in the Temple of Aesculapius, which he did; and, from these experiments, first invented methodical Medicine. Hence from him Medicine, as now taught in the schools, derives its origin. When Empirical Medicine thus came into great honour in Greece, many physicians arose, as Diocles, Chrysippus, Coristinus, Anaxagorus, Erostratus. 500 years after Hippocrates came Galenus, a plausible man who described the Hippocratic Medicine, painting it in beautiful colours, inventing causes and symptoms of diseases, ascribing virtues to herbs, and teaching the cure of feverish illnesses by cold, that of cold ones by heat. Thus did Human Speculation, from experiments, deduce the Science of medicine --- yet, at bottom, it was no Science, but mere opinions, accepted as Truth itself. But God, who is not always wrath with man, has, in our own time, chosen Philip Theophrastus Bombast, of Hohenheim, to rekindle the light of Medical Science, and to expose the deceit practiced in his day. Therefore, this Theophrastus is the True Monarch of Medicine, and will remain so until the end of time. Therefore, it behooves us to thank God and his chosen man, and not lightly reject or revile what we do not understand. This science is above human knowledge, a gift and miracle of God. He errs that would grasp the same with human understanding, for, without the Revelation of the Holy Ghost and Inspiration of God, no one will obtain it --- be he bachelor, master, or doctor.

*Alexander:* How can Paracelsus have rediscovered the true medicine, since he has written so many contradictory things about which his very disciples are not agreed? One says his Art is in Antimony, another in Mercury, Gold, Pearls, and Corals, or in Vitriol, Tartar, and many other poisonous things, that destroy men's lives. I know princes and lords who are terrified at the very mention of Paracelsian doctors.

*Bernhardus:* Only those who do not understand the writings of Paracelsus call them contradictory. But Holy Writ also must suffer the same imputation; as, for instance, Sebastian Franck exclaimed with regard to it: But is it true? However, I cannot deny that much is attributed to Paracelsus which he has never written. So also he himself, in a Theological Treatise, confesses that in his youth, when seeking the first principles of Medicine, he had written things afterwards repudiated by himself, and doth warn us against the same, which (he says) had in time come to be accepted as true and perfect books. What you advance against his disciples is not the fault of Paracelsus. But what think you is the cause of their disagreement?

*Alexander:* I would hear it from you.

*Bernhardus:* You know that Christian Theology is one and united; whence come so many Sects among Christians in Europe?

*Alexander:* There have always been Sects in our Religion. I hold God permits this the better to prove the Righteous; but what has that to do with Medicine?

*Bernhardus:* The fact of there being so many heretics in our Religion is a sure sign and argument that the instigators of the Sects understand not theology. Thus also in Medicine --- the letter is the cause of all errors, yet no one will see that the letter is dead. What has Paracelsus written other than the letter, the right understanding of which comes from God? If it comes from ourselves, the medical heretics are there.

*Alexander:* Many laud Paracelsian Medicine. Who shall say which of these understand Paracelsus aright?

*Bernhardus:* What says Christ, when asked by what false prophets shall be known?

*Alexander:* "By their fruits shall ye know them", Christ replied.

*Bernhardus:* Thus also shall a physician be discerned by his works, not words. By works Paracelsus proved that he had received Medicine from God, and was a physician born, whom also hypocrites hate.

*Alexander:* But what think you of the Medicine derived from the Experiments arranged and methodized by Hippocrates --- is it good for nothing?

*Bernhardus:* I say not so; they are to be praised who have made known to us herbs and natural simples. But philosophy is not necessary for the sick, as Serapion testifies. For the causes of serious diseases, as Apoplexy, Paralysis, Podagra, Dropsy, are all not natural but metaphysical, having their own Medicine as regards the fleshly body and vital parts, as heart, lungs, liver, etc., and for them Medicines enough are found -- - but what is taught concerning the causes of disease is all mere opinion. Since Noah's time no one has understood the causes of so-called incurable diseases, but Paracelsus alone. Therefore, to Hippocrates and Galen, but also to Paracelsus, let due praise be given according to the respective merits of each. With regard to the internal organization of man, Galenus was blind, as are also his disciples. Paracelsus has been the first Medicus Microcosmi (physician of man's body). Hence, he rightly calls himself Monarchus Medicorum, at which title Erastus the Calumniator is like to burst.

*Alexander:* Paracelsus ascribes the cause of diseases to the Stars, administering such poisonous Medicines against these Stars that the Galenists doctors are aghast.

*Bernhardus:* The inner man is astral, hence he must have astral medicine. What Medicines have you in which there is not poison, of which people die who would otherwise live? Take, for instance, wine. Is that not a necessary and useful thing? And yet how great poison there is in it!

*Alexander:* Those who swill wine every day find no poison in it.

*Bernhardus:* They have to thank their strong constitution for that. When weakened they will soon find out whether there be poison in it. Know you not that the less poison there is, the less Medicine, and the stronger the poison, the stronger the Medicine. But you Galenians will not recognize poison, speaking of phlegma, melancholy, and cholera --- wherein is nonsense --- knowing not that the poison in medicine and food does everything.

*Alexander:* I have long noticed that the excrements of food and drink produce many diseases in us. Paracelsus has also written much concerning Tartar. But what the excrements in us are composed of, how they become a disease, what transmutes them into another substance, I know not, and cannot learn from his writings, much less understand the fabricator of the disease, the instrument with which it works, and the subject out of which it is made and multiplied.

*Bernhardus:* The true doctor must know more than of melancholy and cholera; with them the patient is not served. We thank God, are better acquainted with man, and with what constitutes his sickness and health. Therefore we may well laugh at Erastus, Bernhardus Dessenius, Croneburgius, Lucas Stengeleinus, and other pseudo-doctors like them. Did not Christian love, and the misery and need of the sick, so compel us, we had rather be silent than mention the true Medicine to such blind, stubborn persons.

*Alexander:* It is our duty to assist our neighbor where we can. Medicine, which, next to God, should be man's refuge in sickness, is despised in our time. The peasants, observing that doctors understand it not, prefer to die than to entrust to them their bodies. Be not afraid because some rail at the truth. Help those who seek it. Let the choleric and melancholic dogs bark; they cannot harm you. Not everyone may understand the truth, yet it must be taught, should but one in a thousand receive it. Therefore, for our old friendship's sake, I beg you to instruct me concerning the simples enumerated by Paracelsus in the chapter about Dropsy, what they are and where to be found. Also shew me how to get to the bottom of the matter, since Galenus knew the true cause of disease, and the Stars of Paracelsus are beyond me.

*Bernhardus:* Paracelsus prescribes three things for the cure of dropsy. The same cannot be explained in a few words. Natural Magic is extinct in our day, hence also its terms are not understood. I will tell you as much as necessary for this time. In order that the ignorance of doctors concerning the cause of dropsy may be plainly shown, let us examine the cure set up by Erastus in vol. iv of his Disputation against Paracelsus! You will then perceive the hideous labyrinth of doctors, and what a coarse fellow Erastus is, wholly ignorant of man's creation and composition. Therefore, say on about what you would know; this afternoon I will devote to our colloquies; tomorrow I have other things to do. What says Paracelsus concerning the cure of dropsy?

*Alexander:* He divides the same into Diagnosis, Purgation, and Strengthening. The disease is to be resolved into water, without which it cannot be cured. But how shall the medicine resolve into water a disease consisting of water? I have myself seen more than a pailful of water taken from a dropsical patient. If the disease be water, what is to be digested?

*Bernhardus:* The water can and ought not to be digested, but that which is not yet water, and which clings to the nutriment of the blood. That is the excrement of food, called Tartar by Paracelsus. This Tartar is the disease to be resolved by digestion.

*Alexander:* How does this resolution take place?

*Bernhardus:* Through digestion.

*Alexander:* What is digestion?

*Bernhardus:* It is a medicinal power, separating Tartar from Nutriment, bad from good, disease from health. In this separation Tartar --- which is a mucilage or viscous matter --- melts into water. For Tartar in its first matter is nothing but water.

*Alexander:* In what form does this medical force act?

*Bernhardus:* Its action is like the Sun. Thus, Medicine is a Sun, and is called the Earthly Sun, or Sun of the Lower Firmament. That Tartar melts into water is well known to all experts in Natural Medicine, but when melted in water it still remains Tartar, even as salt cast into water remains salt. Hence as Astrum (Star) must be there

*Alexander:* What is an Astrum?

*Bernhardus:* That you will learn when we speak of medicines to be taken from the excrement.

*Alexander:* I understand that the Tartaric Phlegm is the matter of disease, and that this phlegm is an excrement of food. Does this matter proceed alone from food?

*Bernhardus:* No; also from the air, poisoned by the vapours of the Earth, Water, or Firmament, which in us becomes a Tartar.

*Alexander:* Does Tartar come from every, or from one particular, food?

*Bernhardus:* Herein lies not a little philosophy. The Humorists are not worthy to learn it. However, I will discover to you somewhat of this secret. The Tartar of Dropsy is the excrement of various foods, as bread, fruit, and all kinds of roots and herbs. This Tartar is, in its essence, cold.

*Alexander:* How should his Tartar be cold when we in preparing it see that it is nothing but water, and sharper, more burning, than salt?

*Bernhardus:* Every essence is water, and externally hot from the resolution of the elemental body; therefore this Tartar is cold fire. Now, these Tartars which come into us through meat and drink are divided into four genera. One kind is in the fruits of the earth; another in the food obtained from water, such as fish, etc. The third is in the flesh of animals and birds. The fourth is from the firmament. Each kind has its place in the body which it possesses. Had philosophers rightly apprehended these excrements, Melancholy and Cholera had never been imported into Medicine. They were good, lazy fathers, judging things by external. It is not written on everyone's forehead what in him is. Virtue must be sown ex radice centri, not by its superficies.

*Alexander:* Can one detect the kind of Tartar present in the patient, or must it be assumed?

*Bernhardus:* In Medicine what cannot be understood should not be assumed, for Medicine is subject to its works, as Theology is to Faith, which, however, must be confirmed by works.

*Alexander:* Where does one find the Tartar of Disease? Is it found in Urine?

*Bernhardus:* It is present in urine, but is imperceptible.

*Alexander:* Why?

*Bernhardus:* Urine there is not Tartar alone, but many other things in which Tartar is hidden.

*Alexander:* How is it detected in Urine?

*Bernhardus:* The art of separation distinguishes the parts from one another, viz., Fumus Salis (Smoke of Salt), called gore by Paracelsus; water from food; superfluous salt; Sulphur; finally we find Tartar in its four kinds. He who can distinguish them perceives of what kind the Tartarus Morbi is.

*Alexander:* I have never heard of this separation, nor do I know how it is done, but I admit that this art is most necessary to a physician.

*Bernhardus:* He who is unacquainted therewith will remain a Melancholic or Choleric doctor, for he cannot thoroughly understand the matter of the disease, and therefore it is impossible for him to know wherewith the “fabricator of diseases” plagues us, breaking the machine of the Lesser World (human body) and driving out life. Now, no one can deny that Galenus, Avicenna, and all other doctors writing before Paracelsus, knew nothing of this Tartar, and a clever physician of Heidelberg would be equally ignorant. It is a great impertinence to belittle a thing one does not understand. It is just as of a cobbler wished to teach a tailor his trade. I tell you that he who can find and judge this Tartar in Urine is more worthy in Medicine than if the four volumes written by Erastus against Paracelsus had wiped his posterior extremities. I mention not other secrets far greater than this.

*Alexander:* You said just now that each genus of Tartar possesses a particular portion of the human body. In what part is the Tartar we are now speaking about?

*Bernhardus:* In the part subject to Venus and Mars.

*Alexander:* What and whence is this philosophy? I have never yet heard of this phantasy.

*Bernhardus:* I believe you. Had you attended the School of Physic as long as that of Sophistry, you would not call it phantasy.

*Alexander:* How shall I understand this?

*Bernhardus:* Those are the places within us in which the spirits of the kidneys, mother, and gall rejoice and exult.

*Alexander:* The astronomers say dropsy comes from Saturn. What did you say about Venus and Mars?

*Bernhardus:* Although some astronomers subject dropsy to Mars, yet Saturn is the cause of disease when we come to the cause. I speak here not of the cause, but place.

*Alexander:* What is the place (locus)?

*Bernhardus:* Open your eyes and search in Astronomy, and you will find it --- also from the following description ---

*Alexander:* Before proceeding to the means of cure, tell me, are there other excrements in food and drink besides Tartar?

*Bernhardus:* Food and drink have three excrements, viz., (1) Water, (2) Salt or Tartar, (3) Sulphur.

*Alexander:* I understand the water. But what are Salt and Sulphur?

*Bernhardus:* Salt is the earth found in every creature. Sulphur is a solid, burning when cast into fire, and is the fire in wood, in fishes, in stones, in metals.

*Alexander:* According to Paracelsus, there is in a body not more than three substances, Mercury, Sulphur, and Salt. You say they are excrements. If there are but these three in food, what then is excrement?

*Bernhardus:* Now you ask me not a little thing. Rather tell me from Galenus what nutriment is.

*Alexander:* What should it be but the most subtle and purest (essence) in food, which “is assimilated to the body”, as Galenus says.

*Bernhardus:* A peasant, not a doctor, might put it so.

*Alexander:* One must speak according to one’s understanding.

*Bernhardus:* Behold, is it not lamentable that all the lot of you know not what becomes flesh and blood in us? Why speak you of diseases and their origin, not knowing the least thing in Physics? All your writing and chatter is nought but a plausible deceit; how long have you befooled us! Think you, the world will always remain blind? O excellent man, that have not yet learnt the alphabet of Medicine, not to speak of anything more! Shame on you for opening your reviling mouths against the beloved man through who God has restored to us the Science of Medicine! What would you say to a cobbler boasting that he could make the best shoes and never having seen the leather they are made of? Would you not rebuke him? What shall be said of you, writing great books and chattering in your lecture-rooms? It is easy to preach about colours to the blind. You have never seen Medicine, and know not whether it be black or blue. I speak here of the Science of Medicine, not of local remedies --- called by you specifics --- that is, of things good for stomach, liver, etc., etc., aperients and so forth. These are not the things that dignify the physician, and whence he has his name. But you have set your specifics in the place of Medicine, and adulterated them by your own compositions. Is it not true that the Sisters of Ulm restore more sick persons with their specifics, than you by your method?

*Alexander:* I know Princes of the Empire who have been treated and cured by Galenian doctors.

*Bernhardus:* They use Simples as given by God. What the doctor and apothecary concoct often does more harm than good. But one dare not say so for fear of being called an idiot. Both are most honourable gentlemen who would fain blind these that see. Yet their wise Worships know not what is the nutriment in bread and wine. But, not knowing this, you also know not what are excrements, and what is the matter of many diseases. You see there must be something, you know no what, and therefore it must be Cholera, Melancholy, Phlegm, or Blood. Were you skilled in Physics, you would therein find --- not Cholera and Melancholy --- but excrements, comprised by Paracelsus under the name of Tartar. But, being ignorant of Tartar, you know not on what the Medicine must act, nor what that is which separates Tartar from Nutriment. Hence, as you will hear, the Resolution of Tartar is a mystery. I have thus described Tartar, what it is, into how many kinds divided --- to which certainly dropsy belongs -- that you may understand Paracelsus's saying: Dropsy arises not from the element Water, but from the Earth.

*Alexander:* I have often wondered at that saying since the disease is dropsy. Now, I see that Tartar --- the disease in man --- proceeds from the products of the earth used as food by him. But I should have thought that our nature would remove the excrements and feces.

*Bernhardus:* That it does when well, but when infected, or impeded by outward accident, it cannot perform its office, and the excrements remain in the chyle. Hence in stomach and liver proceed stomach and liver complaints, in the kidneys diabetes, calculus, putrefactions, in the joints Podagra, Arthetica, etc.

*Alexander:* Is everything we eat and drink mingled with these excrements, i.e., Tartar?

*Bernhardus:* Everything. God has so ordered it that no food is free from this poison.

*Alexander:* Can the excrements be separated from food outside of man's body?

*Bernhardus:* The grossest can be separated, viz., those falling out of the stomach into the intestines --- not the others. Hence also the juice of herbs should be extracted, the rest thrown away. Look at rectified spirits, how subtle they are, yet in them is still the Tartar which Nature alone separates. This Tartar, by reason of its subtlety, is most similar to Tartar of the Firmament, a strong kind, whence arise plague, pleurisy, and various fevers.

*Alexander:* Is the water in dropsical patients resolved Tartar?

*Bernhardus:* In a patient who has been tapped, and in whom the water reappears not, in that water is resolved. But where the water reappears in the patient, the Tartar remains in him.

*Alexander:* But what is the water?

*Bernhardus:* Our blood and flesh, and the nutriment of the food, together with its liquid excrement.

*Alexander:* How are these changed into water?

*Bernhardus:* Through water. Thus, in Tartar is (1) its own Elemental Water, (2), Astral Water which is the cause of disease. These two waters unite in Tartar, like male and female semen, producing a poison fatal to our flesh and blood.

*Alexander:* How is this fatal result produced?

*Bernhardus:* The Salt in flesh and blood being the medium of the other two, when the former is in health flesh and blood remain whole; on the separation of salt destruction begins. The same can be converted into all kinds of salts. According to the transmutation of the disease. Thus, in dropsy, the microcosmic salt is melted, by the above poisons, to water; now flesh and blood lose their being, and are changed into water, their primary matter. The Nutriment (which is not yet blood) is not water, but a viscous liquor, a medium between primary and final matter, i.e., between water and blood, or flesh, or whatever else was to become of the Nutriment. This medium is also resolved into water.

*Alexander:* How comes it that Nature resolves some Tartars, driving them out with the water, and others not?

*Bernhardus:* In the Tartar resolvable by Nature, the elemental poison alone does the mischief. This your laxatives and herbs may expel. Hence you may cure such dropsy. But when the elemental poison is united to the firmamental, then Nature's laxatives have no power, and --- the water reappearing after tapping --- you call the disease incurable. Hence it is evident that you understand not medicine and the causes of diseases.

*Alexander:* I have seen some dropsical patients cured, and also many die. Now, I understand that elemental diseases are cured with elemental Medicines. But firmamental ones alone with firmamental remedies, of which we Galenists know nothing. I understand also what Paracelsus calls elemental disease. I would know something more concerning Tartar before we come to the Medicine for Tartar.

*Bernhardus:* How can I treat of all the mysteries of Tartar in a single disease? Tartar is a wonderful creation of God's --- in it is the mother of all creatures. The upper Heaven procreates from it wondrous things on earth, and the Astra Microcosmi (stars of the lesser world, i.e., human body), many diseases, of which I will now say nothing. Would that physicians knew Tartar --- not only its transmutations in food and drink --- but also what God has created from it in Nature! They would then behold great wonders, daily before our eyes but not recognized. Hence many despise Paracelsus's writings through ignorance, not knowing Tartar more than the peasant who says Tartar is the crust in wine barrels. The time has come when this, and other, blindness must be exposed, to the praise of God and weal of the sick.

*Alexander:* In the future I will pay more attention to Tartar and its diseases. Tell me, now, how is it resolved and expelled?

*Bernhardus:* Paracelsus names two Medicines, an external and an internal one. The former is to digest, mature, and resolve the disease, expelling the inward, viscous Tartar.

*Alexander:* He says the Medicines to expel Tartar are dung, and come from dung, as: Columbinum and Gallinaceum; what these things are I know not, e.g., Rebis!

*Bernhardus:* The learned are wont, when treating of Nature's secrets, to wrap up the truth in other matter. Here he gives the Medicine its right name, i.e., Rebis, adding Columbinum and Gallinaceum to mislead his enemies.

*Alexander:* I doubt whether external poultices are able to resolve Tartar, which lies so deep in the body.

*Bernhardus:* Poultices, liniments, etc., are not to be rejected; although they resolve not the Tartar, they promote the action of the medicine.

*Alexander:* Must Rebis be applied externally, like Gallinaceum and Colubinum?

*Bernhardus:* Know that man is divided into inner and outer man. Each has its Medicine, and, since the outer man is but dust and ashes, and of a like nature is the Materia Morbi which plagues us, so also must the Medicine consist of things similar to these --- called by Paracelsus stercora (filth). Not that the Medicine is filth, but it arises in filth, as the inner in the outer man; and, even as death divides the inner and outer man, so does art separate Medicine from filth.

*Alexander:* What is this dung from which the Medicine to cure Tartar is taken?

*Bernhardus:* You may learn this from Paracelsus who says: External and Internal Medicine are similar; both have a head; one helps the other. From these words it follows that Columbinum and Gallinaceum are not the external Medicine, for, how are they similar to Mercury? And how have they a head?

*Alexander:* I don't know what he calls Mercury. Mercury is commonly called Quicksilver.

*Bernhardus:* Mercury is a general term; it exists in all creatures, and is water.

*Alexander:* Here he means metallic Mercury.

*Bernhardus:* Not at all, although it may appear so. That is not our Mercury which is found in Quicksilver and all other metals. The matter (primary) of Quicksilver and metals is water --- frozen water, like crystal. Thus, also, there is water in metals. A mineral, sulphureous, igneous Spirit pervades this water and transmutes it into a metal. Chemists call it a generating spirit, and say: Dry water and the generating spirit are Nature's principles.

*Alexander:* I see I must have a better knowledge of metals to thoroughly understand this Mercury.

*Bernhardus:* Many, both Ancients and Moderns, have written about the metals. Read them.

*Alexander:* I have read them long ago. They differ. I fancy they have had but little experience. By reading and speculation Truth cannot be attained. Seeing and handling is necessary. You have seen and experienced a resolution of metals. Hence you can inform me correctly. Seeing is Believing! As the Proverb says: The ocular witness of one is better than the hearsay evidence of ten.

*Bernhardus:* I admit you cannot discover the truth about Tartar without knowing what Mercury is. But what shall I tell you about secrets which are said to be unfathomable?

*Alexander:* Let a thing be hidden ever so long, it must come to light at last.

*Bernhardus:* It is said: Time brings Roses. Time also reveals nature's secrets. Time has given me knowledge which I will here impart to you. Basel, Cologne, Denmark, Silesia, and where else the great Paracelsian doctors dwell, wish to reveal nothing before the time. I like not these long prefaces. They affirm that our Autumn is not yet come, and therefore are our fruits sour. That is not bringing Paracelsian Medicine to light.

*Alexander:* I have heard many learned men say the same.

*Bernhardus:* Wherefore much talk and no instruction. Who would guess we had tasted a drop of Paracelsian Truth?

*Alexander:* I should think more highly of it, were the students first taught the right foundation on which Occult Medicine stands. But one chatters of Antimony, another of Gold, Pearls, Coral, etc. I know Antimony is a strong emetic and purgative, as also Hellebore. I know that Pearls comfort, as also Melissa, Crocus, etc. Here in dropsy Mercury cures, but so also does Coloquint. Although I am acquainted with this, yet my knowledge is no knowledge, since I am ignorant of the basis and cause. Hence those who are instructed should lecture and write concerning the foundation, that young doctors might understand Paracelsus' books. If that be not done, the Paracelsian tree, which began to flourish Anno '58, will bear no fruit for many years.

*Bernhardus:* You are right. Our opponents believe us to have no other foundation than what we know concerning the three principles, S., Sulphur, and Salt. But these learned gentlemen are so misled by their envy and hatred, that they judge of unknown matters as a blind man of colours. The lost art of Medicine --- recovered by Paracelsus --- had an externally sure foundation, against which the gates of Hell cannot prevail, let alone the trashy books which Erastus, with his blind, stubborn adherents, has vomited forth against God and the truth. The true principles will remain as we teach them, but it is untrue to say that they are our foundation. I well know this house stands on the earth, and the earth is its foundation. But what the earth stands on, and what its foundation is, every peasant does not know, also not Dr Fortyle at Heidelberg, although he be a good Dialectician and Rhetorician, and well read in Aristotle. He who is acquainted with the basis of our three principles, knows our foundation, not Galenus and his spawn, Erastus. Be not surprised that many followers of Paracelsus are ignorant of this foundation. Remember rather the text: "Many are called but few chosen". Medicine comes not from seeing and hearing, or much reading, but from God, through inspiration of the Holy Spirit. It is in God, and comes from Him. From Him we should speak and write, not from ink and paper, as many of our followers do.

*Alexander:* I have read in Paracelsus that many would adopt his practice, did he not beg them not to attempt this until after long experience.

*Bernhardus:* We wish to fly before the time, hence we must drown with Cato in the deep sea. What think you, who shall explain the mysteries of Paracelsus? Truly we consider ourselves great philosophers, and yet our knowledge is nothing but vanity. Hence the proverb: The world is ruled by opinions. The present time is not ripe for the knowledge of these mysteries, for it has never tasted rest. When the time comes --- before the Day of Judgment --- in which the secrets of all hearts are laid bare, at that time, says Paracelsus: I order my writings to be judged.

*Alexander:* I understand not this passage concerning rest. Be that as it may, I know neither doctor nor master is born so. All must be learnt. In this is labour and trouble until one has understood what one would learn. Then one has rest from learning.

*Bernhardus:* Happy is he who is at rest. He has conquered all labour and trouble. E now lives in knowledge; therein his heart abides, which in time was troubled and bound fast in woes. The physician must be at rest who expound Paracelsian to youth. Whether the doctor is at rest who spends much time in preparing Vitriol and Tartar, I leave to the judgment of every learned man. Our aim should be a very different one. Hence you must not take my speaking of these things in a manner beyond your comprehension amiss. What I know of these secrets I have acquired with great pains and labour.

*Alexander:* I would have instruction from your experience, not from this or that author. When we were young comrades in Italy you would be subject to no sect, but you said with Horace: "A stranger I, whithersoever the winds may bear me; No lord claims my allegiance". Hence I would listen to your views, not those of Galenus or of any other contained in Books and Writings.

*Bernhardus:* It would not be easy to do without books, but what is contained and hidden in books can only be expounded by those who have penetrated into the hidden meaning and spirit of the same. We all know that our Christian New Testament has been written by men full of the Holy Ghost. But when men, possessing little of the Holy Spirit and much of their own, approach these mysteries, what harm and trouble they cause in the world! Thus also must happen, in our Faculty, to those who --- knowing how to prepare Oil of Mercury or Vitriol, etc. --- would meddle with the medicine of Paracelsus. Hence I would beg every reasonable man not to attempt to discover the mysteries of Medicine with such vain and mechanical work, but to reflect on the names of the mysteries, what Oil of Mercury, Juice of Coral, Resin of Gold, really mean, for they must not be taken literally. Behold the disciples of Galenus, how many thousand books they have made out of a single one of his! Were we to do so, the literature of Paracelsus would soon grow up.

*Alexander:* I believe Galenus is easier to understand than Paracelsus; hence easier to write about.

*Bernhardus:* What he says concerning the properties of Simples is plain. Also his phantasies concerning these properties are not hard to grasp. But it is different with the Books of Paracelsus. He writes concerning Nature's Secrets and God's Wondrous

Works. Everyone cannot understand, nor write about, these. They must, indeed, be simpletons who imagine that Tartarus Auri is gold, Mercurius precipitatus quicksilver, etc. They give it to patients, saying they have it from Paracelsus, an excellent physician. O, you simpletons! These are secrets only to be understood by those who have received understanding from above. Hence no one will do much with Tincture of Mercury, Potable Gold, etc., until he has discovered their real signification. Since you also regard Science more for use and profit than for her own sake, think not that God will grant your wish! Therefore, I again beg of those called to these things to leave details and seek the foundation. They will thus gain a knowledge of the mysteries requisite for expounding the Books of Paracelsus, which should not continue in darkness, but be explained by us. I will be the first to tread this path, and, in the due measure that He shall grant me knowledge, so shall I interpret the same.

*Alexander:* A Parisian doctor, L.G. (calling himself Leo Suavius), has written a treatise on the Book De Vita Longa. How like you his interpretation of Paracelsus' terms? He finds no difficulty in common names like Mercury, Vitriol, etc.; hence, I suspect, he has not yet discovered the secrets of Medicine.

*Bernhardus:* This good Leo Suavius has wished to communicate to others his opinion, derived from a study of Paracelsus, for them to accept or reject according to their own private judgment. He has made the first attempt to expound the magic words in Paracelsus. For this he is to be praised, but no one is bound by his opinion. As regards Medical Simples, perhaps he has never tried them, and believes the same to possess the virtues described by Paracelsus.

*Alexander:* I used to think in this way. Now I find it is different. Mercury puzzled me much before I found out that a secret was contained in the name. Some days ago I read in a Treatise (by Castner, of Hamburg) that Mercury is an Arcanum the like of which the world cannot shew. Hence I would fain know what it is.

*Bernhardus:* To come to the point! Listen to what I am about to say! You are a Chemist, and skilled in experimental work. Hence you will easily understand me. Had you been an armchair doctor, my speech would sound strange in your ears. Therefore will I here speak to you and your like, yet, not otherwise or father than is meet, and God's Word permits. What says Paracelsus of Mercury in that Chapter?

*Alexander:* That it is the internal Medicine, having power to expel the resolved Salt. It is to be separated from its ore when dead, for when dead it is mercury, when living Quicksilver.

*Bernhardus:* How understand you this preparation?

*Alexander:* Mercury --- i.e., Quicksilver, is to be extracted from its ore, and a precipitate made from it with Hydrochloric Acid.

*Bernhardus:* What is the ore of Mercury?

*Alexander:* Red mineral earth. Some call it Cinnabar; some say it is the Minium of the Ancients.

*Bernhardus:* When Mercury is extracted from this ore, is it dead or living?

*Alexander:* Living.

*Bernhardus:* Is it living in the ore, or is it made living by melting?

*Alexander:* Water makes it not alive, hence it is so created in the ore.

*Bernhardus:* Behold paracelsus speaks not of such Mercury, but of that which in its ore is dead. Extraction from the ore neither kills it nor makes it alive. Hence it must be wither dead or living in the ore. The Mercury we mean must be dead, not living. Is not Erastus ashamed to accuse Paracelsus of purging dropsy with Hydrargyrum (Mercury), since Paracelsus publicly says it is the dead Mercury; speaking not of Hydrargyrum, i.e., Quicksilver --- as Erastus lies --- but of Mercury, which is no Hydrargyrum?

*Alexander:* Erastus, like others, thinks Mercury is Quicksilver.

*Bernhardus:* Erastus, who sets up for a learned man, ought to understand this matter better than common people, ignorant of letters and science. For those who wander about, boasting of great arts, and promising to enrich others, whilst they are themselves beggars, are commonly a low sort. One is a goldsmith, another a tailor, a third is a cobbler, or runaway monk, or student. Some know a little Latin, some none at all.

*Alexander:* Such artists have often caused me much loss.

*Bernhardus:* It serves you and all others right, who think to discover the great mysteries of God from such indifferent folk.

*Alexander:* Although they be unlearned, God often gives more grace to simple, common folk, than to the literate. It has often happened so. God's grace is not restricted. He is a Searcher of hearts, and according to them does He shew his mercy, not according to external appearances, which we men alone regard.

*Bernhardus:* I have never seen roast pigeons fly into anyone's mouth. When God gives understanding and grace in Magical mysteries, He also gives understanding in other Sciences belonging to magic. One finds not understanding with such people, let them therefore not boast of Grace! They poke about in Alchemistic books, saying Mercury is Quicksilver --- to be calcinated in Aquafortis, precipitate --- or boiled for four weeks with gold in a phial. Then it is an excellent medicine for all diseases, aurum vitae! Such a philosopher is Erastus (he did not get much from Paracelsus), who gave Oil of Vitriol to Excellent Councillor D. Alesius, thus sacrificing his life.

*Alexander:* He is a right learned man; the world has not his like; it is meet that he be spoken of respectfully; for he is a professor at Heidelberg, is well read in Zwinglis and Arrius. But what do I hear? Does he use Vitriol? I have never found any good in it. The Abbot of Fulda died of it. It ran through his penis into the bed and burned the sheets. I have also heard of a Queen who died shortly after it was given her by the physician.

*Bernhardus:* He has killed the good Alesius with it, and also others whose names I will not mention.

*Alexander:* Since he uses the Simples of Paracelsus, why is he so bitter, writing so many lies angst him?

*Bernhardus:* Paracelsus has no greater enemies than the Galenian doctors, who think that they have only to look at a book to know the contents thereof. But the learned asses reflect not that Paracelsus wrote in the Magic style. Hence their brain is so full of raillery that Magic knowledge cannot enter. Therefore they cry: "Magic is Sorcery! Beware, it is the devil's work!". Whereas Magic is no Sorcery, but the greatest wisdom in God's works, and a penetrating into Occult Nature. So Erastus has read much of Oil of Vitriol! He understands not more than a layman, who knows that Vitriol is Copperas. Forsooth, a fine doctor! With respect to Mercury, he pretends Paracelsus means Quicksilver thereby, although he must have read in "The Book Concerning the Disease of the Gall" how violently Paracelsus wrote against Mercury.

*Alexander:* I know all, and think not other than that Mercury is Quicksilver. But Paracelsus might have prepared it medicinally so as to neutralize the poison.

*Bernhardus:* He is publicly against it in the Book Concerning Consumption".

*Alexander:* Since Mercury is nothing but Quicksilver, why does he use the name?

*Bernhardus:* Why call a thing other than it is?

*Alexander:* We know that gold is killed Quicksilver, and Quicksilver living gold, but when speaking of gold, we call it gold and not Quicksilver. If Paracelsus did the same we should know what he meant.

*Bernhardus:* The Ancient Philosophers have named this matter Mercury; Paracelsus has retained the same, writing not for the common people but for philosophers.

*Alexander:* Who are the philosophers?

*Bernhardus:* Those who know Nature better than bookworms. A Philosopher, hearing the name of Mercury, knows what it is; but he who knows not, holding mercury of physicians to be Quicksilver, is a Sophist. Hence, Erastus is a Sophist, not having even learnt what Mercury is; but he is proud of knowing Greek, and that he can speak of Hydrargyrum. Paracelsus says in many places that Mercury is not Quicksilver. Erastus has doubtless seen this, but suppresses the fact in order to prejudice Paracelsus. Here the reasonable man perceives why Erastus and his like rage against Paracelsus. The devil seeks ways and means to preserve his Kingdom in this world. But, as the Apostle says, when perfection comes imperfection will be destroyed. This will also happen here when all sects shall be annihilated.

*Alexander:* Has Paracelsus not made Medicine from Quicksilver? What else is the Mercury of which he writes in this Chapter?

*Bernhardus:* Just the same of which he says that it lies in the ore and is separated from the same, dead.

*Alexander:* What is the ore?

*Bernhardus:* A mineral in which the Philosophers' Mercury has been created by God.

*Alexander:* I thought Philosophers' Mercury was artificial, and you say God has created it.

*Bernhardus:* God has created Mercury like other creatures. Art can do no more than extract and separate Mercury from its ore. Although God has created it, He has also created the physician who converts it into medicine. For as it is found it is rather a poison than a Medicine. Hence the physician should know the art of separating the poison from the medicine. Paracelsus here speaks of this separation, saying it is to be separated dead from its ore, for dead it is Mercury, but living Quicksilver.

*Alexander:* Quicksilver has also an ore from which it is extracted. Does Paracelsus mean this ore or another?

*Bernhardus:* In the ore of Quicksilver there is not the Sulphuric Spirit which kills Quicksilver; therefore he does not mean the same ore.

*Alexander:* Gold, Silver, Copper, Iron, Tin, Lead, all come from ores, each metal having its own ore in which Quicksilver is dead. Does he understand these ores to be the ores from which Mercury is to be extracted?

*Bernhardus:* No. For metal-yielding ores possess not the Mercurial Sulphuric Spirit, but that of their respective metals. Paracelsus speaks here of the Quicksilver of Mercury, i.e., of the Quicksilver by which Sulphur of Mercury is killed.

*Alexander:* I know no other Sulphur which kills Quicksilver but the Sulphur which is in the ore of metals.

*Bernhardus:* Hence you have paid but little attention to this passage in Paracelsus. Take and read the paragraph. What say you to it now?

*Alexander:* I had not looked for Mercury here; I have often read the passage, but skipped over it.

*Bernhardus:* Have you not read in Alchemistic books that there is a medium between Mercury of the metals and common Mercury?

*Alexander:* I have never seen it expressly stated that the medium Mercury is to be found in this ore.

*Bernhardus:* The reason for this is because there is in this ore much poison which, used by those ignorant of Alchemistic processes, might do serious harm to the sick. Hence it is not to be called by its name.

*Alexander:* I know many Alchemists who prepare this Medicine, but all differently. Some use it for physic, others wish to make Gold and Silver of it.

*Bernhardus:* There is a great art in its preparation. First, it must be separated pure from its ore, and then digested in its full strength. This digestion is known to very few of those even who can separate it from its ore. Before digestion it is crude Mercury, and the crudity is poison, of which beware. When first discovered the way of separating this Mercury from the ore, I thought nothing more was wanting, But, from experiments, I found it to be crude Mercury, and that I had not penetrated into its Arcanum.

*Alexander:* Although I have never attempted the separation from the ore, I see that this can be done. But how it is afterwards to be digested and brought to perfection I know not.

*Bernhardus:* This digestion is effected only by the Tincture of the Sun and Moon, which digests not this Mercury alone, but transmutes all other metals and expels their poison.

*Alexander:* These tinctures are beyond my comprehension --- much has been written concerning them, but methinks, by those who have never set eyes on them. I do not see how a physician in our time is to have these tinctures and perfect medicines therewith, seeing that few know more about them than about the Mercury of Paracelsus.

*Bernhardus:* The tinctures cannot be spoken of too highly, but they can be easily understood by those who rightly use their understanding. But we are lunatic Alchemists, as Paracelsus says, threshing empty straw. God has given the tincture to the physician to purify unclean things, to transmute them into gold, and to expel from men all diseases arising from the influences of the stars. Hence it purifies not alone metals but also our blood. For it is the very essence of our life and the Anatomy in the Greater World --- an eternal unquenchable fire --- ignis non urens, ignis coelestis --- fructifying all things, restoring the dead to life. I will inform you further of these tinctures when treating of the Sun mentioned in this chapter. Here you shall learn of the dead Mercury, which is to be digested by these tinctures after separation from the ore. The same is the medicine which administered in dropsy expels the resolved salt. The other two medicines, viz.: --- the Element Water and the Sun, shall be explained afterwards.

*Alexander:* Therefore this Mercury is to be our purge, expelling water in dropsy.

*Bernhardus:* Before the water overflows the heart. It is to be administered when the influence is greatest, i.e., when the dropsical stone is in its greatest virulence.

*Alexander:* But --- if I understand this passage aright, nor purgation, but digestion by external medicine must take place. I will ask you concerning the external medicine later on. Please inform me now more fully concerning the generation of Mercury.

*Bernhardus:* Much has been written concerning this generation (as usual in our time) by those knowing little about it. But occult things are not to be fathomed by

speculation, but by experience in the Art of Alchemy. Hence their writings are nothing but a misleading of youths who trust in them.

*Alexander:* I cannot sufficiently lament the labyrinth such books have led me into.

*Bernhardus:* Concerning the name Mercury, know that it is a matter of Gold, Silver, and of all the other metals. But the understanding of this is not according to the letter, especially not as regards our laxative Mercury. It is not a component of metals, but that which it was before its heaven --- i.e., Sulphur --- decocted and prepared it in its ore, the same is the substance and matter of all metals.

*Alexander:* The philosophers say all metals are formed from Quicksilver.

*Bernhardus:* That is false, for Quicksilver is a metal in gold as well as in silver, etc. But since it is living, it is not reckoned a metal in Adept Philosophy.

*Alexander:* Since Mercury is the matter of metals, as you have just said, what sort of thing is Mercury?

*Bernhardus:* Just the same as the substance out of which Quicksilver, Gold, Silver, Lead, Copper, etc., and our Medical Mercury, are made.

*Alexander:* Has this matter no name?

*Bernhardus:* The inventors of this Art have called it Mercury. Their successors, interpreting Magic literally --- have supposed Mercury to be nothing but Quicksilver, which is the opinion of all book sages to this day.

*Alexander:* This matter must doubtless be in minerals. Paracelsus says metals are formed from water --- is it water?

*Bernhardus:* All these things are of water. But water is the first matter --- and the most remote --- of metals.

*Alexander:* What is mediate, and immediate, matter?

*Bernhardus:* Although one should not speak more clearly concerning these things than is taught in Magical Books, yet --- since some of these books treating of this generation have doubtless been lost --- consider it necessary to explain this matter to preserve youth from false Alchemists. Therefore, listen.

*Alexander:* I have occupied myself much with alchemistic books, but have never found that they inform us concerning the origin of metals. I have therefore lately concluded that it is all trash.

*Bernhardus:* The same was my experience when trusting to books. But when I found it different in water, I let Aristotle, Albertus, and his like be, and followed after the truth, of which I thought more than all their books. You will also understand this secret by paying attention. The primary matter of Quicksilver and of all metals is, in the beginning, as an oil growing out of saltpeter in the hills. Now, all salts are nothing

but water mixed with a little earth, which earth gives the water a taste. For according to the kind of earth is the taste of salts. There is one kind of earth in common salt, another in saltpeter, another in vitriol another in alumina, etc. In dissolving salts these earths are found and become visible. The salt growing out of saltpetre is dry, melts not when thrown into water, but is like glass or crystal. Chemists call this Mercurial Salt. Albertus was of opinion that the white earth in alum was most nearly related to this Mercury. But that cannot be, for aluminous earth has the nature of salts, but Mercurial earth that of stones. Mercury is composed of two things, water and earth.

*Alexander:* You mean here common water?

*Bernhardus:* Nothing else. But the earth is not common earth; it is the subtlest and purest of elements. It has many names which are daily in our mouths. But none save the Magus knows its true name. I should like to explain to you somewhat of this mystery, but you are too deep in the letter which blinds your eyes. Yet at the time of the New Birth I will not forget you. Understand that this earth is the subject into which flow all the influences of the whole firmament, the powers, virtues, and action of all the stars, an eternal dwelling of all earthly spirits, bad, good, sweet and sour, black and white, not alone the subject of all metallic forms, but also of all mineral ones in all things created by God under the Moon's orb. Now, I will speak here of metals alone to the exclusion of other things.

---

## Extracts from the Book of the Three Faculties

by

Alexander von Suchten

To come at once to the point, I will begin by saying that the nearer man was to the Creation of the World the greater was his desire for knowledge of Him who had created him, with heaven and Earth, and all that therein is.

This desire was so strong that it left him no peace until he had found what he sought. At that time there was neither Theology, nor Astronomy, nor Medicine. Man knew no more than he had heard from his father Adam, how he had been created by God and placed in Paradise, had sinned therein, and had been expelled therefrom into the trouble and misery of this world.

How, then, should man know his Creator? In Heaven God was far removed from mortal eyes. Man could not behold Him in flesh and yet live. What should he do to find his Creator? Whilst meditating thus he observed --- doubtless by Divine inspiration --- that the master can be recognized by His Masterpiece, in the great world and the little world (which is man) made out of the great world --- or rather taken from and separated from it. Thus, man acknowledged the Master in His works in that great world wherein he saw a small grain grow into a great tree. He reflected further that the world must once have been different from what it is now, and that the seed grain which grows into a tree must once have been something else than a grain. He could not understand these things with his human reason, but continued to seek, and invented many arts, among them "The Art of Water". For he beheld how everything was, by fire, destroyed and reduced to what it had been, i.e., to earth. He therefore thought of separating things by means of water, not to destroy them, but to see whether hidden properties might be revealed to him by this separation. Thus, after much pains, he at length discovered The Art of Separation. Then he wished to know how everything in the great world was put together, and so divided that world into three parts --- Animals, Vegetables, and Minerals, i.e., one part he gave to the animals; the second to things growing out of the earth; the third to things growing under the earth. Then he began diligently to investigate one class after another. Man he assumed to be the noblest and most intelligent creature of God. By further using his Art of Separation, and by comparing one thing with another, he found that the primary matter of man and the primary matter of the great world are one and the same thing.

But this primary matter of the world and of man is a Crystalline Water, of which the Holy Writ says: --- "Before God created Heaven and Earth, the Spirit of the Lord brooded over the Waters". Thus water became a primary matter of both. But where remains the Spirit of the Lord, which brooded over the waters, after the two worlds, i.e., heaven and earth, and man had been created from the same? I reply, in the primary matter of man and of the world. God, who is Perfection, has wished to dwell in man. But here the following question might be put: how did man know --- since the primary matter of man and of the world is a crystalline water --- how could man know whether the Spirit of the Lord had remained in this primary matter of the world, or of

man? I reply, he knew it by the Art of Water, for Water was his teacher. This teacher shewed him how the world dies, how the Spirit departs from it, how the body is without Spirit, and the Spirit without body. He saw how the Spirit returns to the body, and the body revives. He saw by the decay of the world that it did not become again what it had been before. Hence it became plain to him that God dwells not in that which passes away, but in that which is Eternal.

Thus far I have recorded (1) how God Almighty in the beginning created two things: the Great and the Small World; (2) How man was taken from the Great World and became a separate world; (3) How he discovered the Art of Water and learnt what was the primary matter of both Greater and Lesser World; (4) the qualities of each; (5) How the world is temporal --- man eternal.

Now I will speak of the things arising from the water --- i.e., primary matter, as well as how the first man discovered and divided them, taught them to his children, and described them.

But this I write from my experience, of which alone I make use, and of the Spirit given me by God. Did I write from Theology, Astronomy, or Medicine, I should have to employ their respective terms. But I am ere teaching according to the rules of no special art, but according to that Art which was before them all, and is the mother of them all, i.e., Magic, which in our time has gone into exile, and lies hidden, God knows where, but is quite unknown to men who, relying upon their understanding as upon the Holy Ghost, exalt themselves like Lucifer against heaven. But, banished from before God's face for our pride, we may one day confess that our human intellect is naught, that by the same we cause ourselves much trouble, irritating the Celestial forces, whence arise plagues and pestilence. When we pray God for light --- not by words but deeds --- He will again turn His face towards us, and, putting an end to our misery and unreason, will restore to us the Light of nature that it may shine in our understandings as the Sun in the Heavens, without which the Stars give no light. For our human light, i.e., reason, is by itself dark, and is illumed by this Sun, not by means of ink and paper, but by inspiration. By this Divine Sun alone can the magical Art be explained.

When man by experience had learnt that, as God out of water had made the Great World, i.e., heaven and earth, with all that therein is, and out of the Great World had made man in His own image, He found that in the small world, i.e., in man, Heaven and Earth and all things contained in the Great World had their counterparts. He also found that all bodies contained three palpable and visible substances: (1) Water; (2) Salt; (3) Sulphur. These three things comprise everything created by God --- neither more nor less.

When man learnt how, out of water, through corruption and generation, these three substances are born, he had not yet found his Creator, whose Spirit brooded over the water, as the Scriptures say. He therefore takes the three bodies, narrowly examines one after the other, reflects that God is a Spirit, invisible to human eyes, and that --- since He has created all things --- He must be a Living Power. Therefore man takes water, regards it, finds therein nothing but the four elements. Then again taking Sulphur, he finds also nothing therein but the four elements, that is, nothing stable. Lastly he takes Salt --- sees there is something more therein than in water and sulphur,

yea, he finds two things: (1) A water not different from the former; (2) A Sulphur differing from the former, i.e., a Sulphur which burns not. The third thing he found not, for it vanished from before his eyes. What should he do? It was gone. Where should he find it? He regarded the water, the sulphur, two fine, pure, white substances; but the third, which had lain among them and joined the two together, was departed, and it was the same he had been seeking.

Hence he became very sad, crying say and night unto the Lord, until he found what he sought. But who shall describe how it was found? Or what ears may listen to so great a mystery? Verily, in this is contained the Wisdom of all Celestial and Terrestrial things! Here is the same mystery as when, in the latter times, the Word was made Flesh, the chosen partakers of which see Heaven open with St Stephen, and the Son of Man sitting at God's right hand. And --- with St Paul --- they ascend into the Third Heaven. Hence it is permitted to none to reveal it. Through this mystery the Magi have known the Trinity, and the Incarnation of the Word, and have written concerning the same many centuries before the birth of Christ. But woe to the man who shall reveal this secret in any other way than it has already been revealed! Hence I am to be excused for being silent concerning this Arcanum, which God reserves for His beloved, and will in His mercy reveal to those honestly striving for the same.

To speak farther in respect of the third substance, wherein is the salt that is water and earth --- and of the Spirit of the Lord brooding over the waters: when the Almighty had thus enlightened Man, shewing him how God gives Himself into our hands and dwells in us --- in short, with Heaven and Earth, is in us and about us --- He thus shewed him the great love that He bears to man, that He is always bear to him, delivering him from all evil so soon as Man knows His name --- i.e., knows where He is and when and where to find Him. Yet is this not in phantasies and thoughts, not in books, but in Heaven --- i.e., in Man himself --- not in subtle speculations, but with diligence and labour, in the sweat of his brow. Who can measure the joy of man when he had obtained a knowledge of his Creator, or comprehend the Grace communicated to him by God through such knowledge; for what could he desire on earth that would thereby not be given him? He had for his bodily, human needs Medicine to restore his health. He had his daily bread, peace upon earth, and, after this life, Eternity. That was the fruit of the field he tilled in the sweat of his brow, that the reward of his Lord; for he served Him not by words, but deeds; not by speculation, but by his handiwork in the sweat of his brow. And as the service was, so the reward --- i.e., in works, not spiritually and phantastically --- as happens nowadays to many who, in armchairs and warm rooms, comfortable imagine remedies against diseases until they produce a phantastical recipe for their patient, which, however, does not help the sufferer. Thus does the Master of Lies recompense his followers. But the Master of Truth hates such chatter, and adorns his children with iracles. It is a great scandal that a sick man, created in God's image, should seek that help from the creature which the Creator alone can give. But, as we know Him, so does He help us.

Therefore Man was right to rejoice at having found his Saviour and Creator, who supplied all his wants. Therefore Man also helped his neighbor in his need, fed him when hungry, comforted him when dying. Therefore also he found ways and means to preserve this Divine knowledge for his descendants, and wrote three books:

In the First he treated of God the Father, Son, and Holy Ghost.

In the Second of Heaven and its Stars.

In the Third of the powers of the things growing out of the earth.

These three subjects being:

(1) Theology, (2) Astronomy, (3) Medicine.

By means of Theology he teaches and describes the Middle Substance among the other three --- i.e., the Spirit of the Lord.

Astronomy treats of the Water, over which the Spirit of the Lord brooded.

By means of Medicine he describes the third substance --- i.e., Earth --- which, through the Spirit of the Lord, was joined to, and made one thing with, water. Thus also Astronomy and Medicine, through Theology, are united into one --- i.e., are three in one substance.

In order to communicate his knowledge aright he was obliged to arrange his subject into the above triadic divisions. For had he comprised everything in one Science, great confusion would have resulted.

These three books were revealed by him to his children and kinsmen.

Thus did the knowledge of Theology, Astronomy and Medicine grow. Each one studied what he was fit for according to his capacity. Now, these people were called Magi --- i.e., wise men --- who were of more account than others; hence, also, were they kings, princes, priests, and lords. These did great wonders among the people, curing the sick, restoring sight to the blind, cleansing the lepers, healing the dropsical, giving alms to the poor.

The other people, who were not Magi, considered them more as gods than as men.

Thus came Theology, Astronomy, and Medicine into the world.

The Spirit, by inspiration of which these Magi wrote, remained with them alone; the books got amongst the people. When now the common man saw the wonders described by the Magi, he --- having possession of these books --- thought himself already a Magus, and wished to accomplish the works of one, especially in Medicine. But when it came to acts he found difficulties, and his ignorance of the hidden sense caused him to interpret these books according to his own imagination.

For instance, when he read: "Scammony purges bile", or "Wal-lwort (dwarf-alder) cures dropsy", etc. --- he sought until he found some herb "rumbling through the belly", and, jumping to the conclusion that bile was thereby purged, the same herb was in future his Scammony of the magi. Again, on discovering a herb of some little use in dropsy, he set it down as the wall-wort of the magi. A herb of some effect in fevers was the Chamomile of the Magi, and so forth.

Thus were Commentaries on Medicine written, and there arose a Sect calling themselves physicians, multiplying as weeds are wont to do. When now the Magi died out (perhaps God would have it so), true Medicine also died out with them; and after their death there remained this Sect, who ignorantly arrogated to themselves a knowledge of the magical Books. They, however, were not kings, princes, priests, or lords --- they were beggars, who by their chatter sought money and goods and honours with the people. The greatest chatterer was accounted the best physician.

These also wrote many books concerning herbs and diseases. In the course of time the true volumes of Wisdom got lost --- what could be done with them? They were too hard to understand! Thus it happens that in our own time we have none of them.

In a similar way was Theology treated. Ignorant men intruded themselves into this Science also. Possessing the written words, they imagined they knew God, and farther study was unnecessary! So these were Mouth-and-Belly Theologians, making much noise among the people. But they healed no sick, restored not the lame and blind. It was not their province, but that of the physicians, to wit!

The same thing happened in Astronomy. They beheld the Moon, Sun, and Stars rise and set, and, having made these elementary observations, straightway considered themselves Astronomers. Imagining many spheres and circles, they wrote many imposing volumes about them. Who could contradict or expose them? The Magi were dead, and the world was filled with lies; and so it remains to this day. How could God punish the world more severely than by permitting these false teachers, who knew not the true origin of the three Faculties?

Thus came Theologians into the world. They have received their spiritual understanding, not from the Magi, not from the Light of Nature --- by the light of which we may know Him and His creatures, as the Magi found Him --- but from Theology, in which they have darkened the secrets of God to the utmost, so that the knowledge of God, i.e., the treasure of the whole world, might remain with them alone, when it should be the possession of all those whom God reveals Himself. Why then should he not also reveal Himself unto us? Are we no men as well as they? I reply, there is an impediment in our sloth. It is much easier to sit in church for an hour, listening to another, or at home to read one book after another, than with all the resources of body, mind, and estate, in the sweat of our brow, to seek diligently after the Living Spirit of God --- breathed by Him into the lump of earth when Adam was created --- which opens our eyes, revealing the secrets of Holy Writ, of Peter, of Paul, and of the Apostles. Thus may we become theologians, useful to the world, and able to help our neighbor in his need. Thus also may we receive from the Spirit of the Lord in us health and peace, may know the Sin of Man, and how His Flesh transmutes our flesh into His Flesh and Life Eternal. But, say the Theologians, we have read the Scriptures and theological works, we possess the plain truth --- what more would you have? And they testify as to their doctrine, and as to whom has made theologians of them, by stirring up one country against another, and by causing misery in the world.

They have found a sign in the Church, viz., that of water. Had they sufficient understanding to know the meaning of this symbol, they would also know what their Theology was worth. But to this hour not one of them understands the mystery, which, according to their opinion, is a Jewish or Heathen thing. Thus, also, have they

rejected many Magical and Apostolical observances. Had they inquired into the causes of these observances, they would have discovered them to be Magical books, which give us as deep an, or even deeper, insight into God's Mysteries than written books. Such Magical books have been in the Church from the beginning. They are not hidden away in boxes, but are open to everyone; and are to be found among Jews and Heathens, Turks and Tartars, but chiefly among Christians. They are there for rich and poor, learned and unlearned, crying out every day, and teaching us the way to truth. But who hears them? Have we not ears to hear their cries? Priests, monks, and nuns go about amongst us, and know themselves what they do. The Ark of the Testament is covered; they know as much as you. But never heed them; they speak but as they have been taught. Look rather up on High, reflect why we are here, consider what He knows Who has willed that we also should have knowledge, and you will receive Salvation from God. Inquire not after them what they do; they must do this for their daily bread. Let their chatter be. You have Moses and the Prophets, Christ and the Apostles; hear what they say. They speak not with the mouth alone, but with hands and feet, with fire and water, with silver and gold, with salt, with silk, with velvet, with stone, with black, with white, with red, with yellow, with wax, and with oil, etc. Hear not alone what the mouth says, what the salt says. They also speak, but another tongue. Learn this, and then Scribes and Pharisees will not be able to lead you astray, nor cause strife among you; yea, you will have peace in your conscience towards God and your neighbor.

But if you hearken not to what we say, holding their works and books as sacred, you will be led away from one Sect to another, and suffer damage and shame in your bodies, wife, children, land, and servants. Our enemies will consume you, and thus shall be your reward for the wisdom falsely imagined by from the letter of our books. Therefore, hearken to our words. Learn to read these books, in which are no allegories, no metaphors, no parables, but the naked Truth. We are able to expound the Old and the New Testament, Not this or that peasant who has just come from the plough. Thus is it written in the Book of Ecclesiastes: "Happy is he who knowest her voice" (the voice of Truth).

Medicine has also its Revelations, which have brought it to honour.

(1) The books written by the Magi themselves. (2) The Signs which they, for our benefit, have chosen and appointed. For, when in the beginning the three Faculties were described, to each were signs given by which it might be interpreted, and for this cause: that if the Books were lost --- as afterwards happened to the one Faculty of Medicine --- something should remain by which Truth might be learnt. Hence to each Faculty certain imperishable signs are appointed.

Of all the theological books, the two Testaments alone remain to us. There are also theological signs (that we might have other books in case the written ones were lost), such as: the mass, Hymns, etc., of which we have sufficiently treated above. The Medicinal books, written by the magi, are all lost. We have the signs alone. These are: all herbs and trees upon the earth. These signs are now our books, written by God Almighty alone, Who, in His boundless mercy, has communicated to us such books; not that these books are our health --- just as in Theology the Church Ordinances are not our salvation --- but that from them we should find health and salvation, by a right knowledge of the God Who ordained them. Many self-styled clever people, seeing

that masses, singing, and organ-playing, wax and oil, and salt cannot save us, have rejected them. Why do not the doctors of Medicine do likewise? They see that Elder, Saxifrage, etc., do not cure Stone and Podagra, as the books relate. Why do they not forbid the earth to bear such fruits, since they do not what is written concerning them? It is not thus. God has created the earth and adorned it with its fruit, just as God's Houses have, by God's learned people, been adorned, which ornaments also will doubtless remain. The earth will keep its flowers, although Podagra be not cured thereby. Thus, the herbs and flowers are not the medicines, but only signs to point Medicine out to us, just as the Sacraments point God out to us, not that they are God, but appointed by God's Word, even as the herbs in the field are created by the same. It is written: "Chelidonia (Swallow-wort) cures jaundice". A book-learned doctor taking Chelidonia fails to cure jaundice therewith. Whose fault is it? That of God's creatures, or of the Magi, or of the doctor disappointed of his fee? Verily, although with Chelidonia jaundice cannot be cured, yet its praise will doubtless remain in the books of Medicine. Not in those studied by armchair students, but in the books written by God Himself. These are the earth, with its herbs and flowers, given us by the magi to teach us the Science of Medicine when their books were lost (which has now occurred). Thus Chelidonia indicates to us the remedy for jaundice; not that it is the remedy, but a Medicinal Sign. Thus also with other plants. But we wish to hear nothing of magic, writing stately volumes, according to our thoughts, concerning herbs --- taking the Sign for the thing designated, and filling books with the virtues of this or that plant. We give large sums for such books, go to Bologna, Padua, hear much chatter about Medicine, but see no leper cleansed, no dropsy or podagra healed. We spend much money, and at last get a red (doctor's hat) for our pains. But in time of need, when a cure is to be effected, all such chatter is not worth an empty nut.

What shall we say concerning the third Book of Wisdom, Astronomy? We have its Magical Books, although cruelly mutilated and sophisticated. We have also its origins, viz., Sun, Moon, Stars, and the whole Firmament. But this Faculty has fared like the other two. We confound the thing designated with the sign, i.e., the Firmament and magical Books --- not having yet learnt that a nut has both shell and kernel. But the kernel is not the shell, nor the shell the kernel. The Sun, Moon, and Firmament are the Signs which every peasant can see, but the thing designated is understood alone by the divinely taught man. He knows that there is another and different Heaven, Firmament, Sun and Moon from that which thy red hat can teach us. He knows that the Theology of the old world foreshadows its Messiah. He knows that God created two worlds, two Heavens, two earths. He knows also that one world has its Theology, Astronomy and medicine, and that the Astronomy of the Greater World indicates the Sun and Moon of the lesser (i.e., man); so also the Medicine of the Greater indicates that of the lesser.

Thus the outward world represents and explains the inner one. The former is the sign, the latter the thing indicated. Therefore, also, church ceremonies, etc., are not my salvation, but God dwelling in me through Jesus Christ and Faith.

The Sun and Moon I see above me influence me neither for good nor bad, but the Sun and Moon and Planets, with which God's Providence has adorned the heaven in me, which also is the seat of the Almighty, these have the power to rule and reform me according to their course ordained by God.

Wall-wort and Elder growing in the earth of the Great World cannot expel dropsy, nor the Strawberry plant cure leprosy. But the Wall-wort, Elder, etc., growing in the earth in our little world, they do so. But of this earth with its fruits, if this Heaven and Stars, of God and our salvation, one hears naught at Paris, Bologna, Louvain, Wittemberg, etc.. They have never tasted the sweetness of this Kernel, but have spread the bitterness of the husks over the whole world. I therefore conclude, having described:

I. How the Spirit of the Lord brooded over the waters before God created Heaven and Earth.

II. How, out of the same water, God created the Greater World, i.e., Heaven and Earth.

III. How, out of the Greater World, He created the Small World (i.e., man), a small Heaven and small Earth.

IV. How God has set His Seat in Heaven, that is, in the Heaven in man.

V. I have shown that man, with his human understanding, could not comprehend God; but having sought his Saviour in the sweat of his brow, he at last found Him. That from Him he learnt all Nature's secrets, writing an account of the same in books, and explaining the same to his children. That, by the dying out of his race, the common man had obtained possession of these books, and, in his ignorance, had retained the husk instead of the kernel. That through this many Sects had arisen, which continue to this day, and doubtless will remain to the world's end.

Therefore, those who would be professors of Theology, Astronomy, or Medicine, should learn magic before going to Bologna or Paris; that is, the Art of finding the Lord in His creatures, the Fiat by which the world was created; that is, the Seed of Heaven and earth, the Breath of God, which, breathed into a dead lump of earth, made of the same a living man.

This Art knows all secrets in Heaven and earth, and can teach us to know God, to understand the Incarnation of Christ and all things in Theology. It shews us our Sun and Moon, Planets and Stars, as they rule in us, making peace and friendship with one another, according to the teaching of astronomy. The same also reveals to us the true Hermodactylus, cure for Podagra; the true Ebulus, healing dropsy; the Coloquint, expelling ague; the Crocus, strengthening the heart, etc. This Art is our Theologian, Astronomer, and Medicus, a right and true schoolmaster, crowning his disciples with miracles, standing by them in all needs; yea, leading them out of this life to Him out of Whose mouth it came into the world.

Did but Theologians learn the interpretation of the Scriptures from this Art, and not from themselves, there would be no Sects, but all would be united, even as the Apostles were united when taught by the Holy Spirit sent to them by Christ. Even the Apostles could not fully understand Christ --- although he was daily with them, personally teaching them, etc. --- before the coming of the Holy Ghost. We also cannot understand the Sacred Scriptures except by interpretation of the Holy Spirit.

Let us not dare to expound these Scriptures, unless Christ eats and drinks with us, that is, is personally with us as one man with another. Although we have books, let us not boast that we understand them. Why did not the Disciples understand? They heard the Doctrine of Christ from His own mouth, which, verily, is much more than reading it in books; had they understood the same, what need had they of the Holy Spirit? But it was impossible to them, and much more so to us. The Spirit of the Lord must first open our eyes and enlighten our understanding; then shall we know the One God, and have one Religion like the Apostles. What man learned in the Scriptures has ever discovered from the literal words that there are Arts by which Man may be made a partaker of that Spirit which moved upon the face of the waters and was breathed into Adam?

We know that St Paul --- when he, as a Pharisee, together with many other learned Jews, persecuted the Christians --- could in no wise be persuaded that Christ was made Man. But, having come to a knowledge of God through the Holy Spirit, he believed the same. We also know that St Paul communicated this mystery to the highly learned Areopagite Dionysius, who believed, and became a Christian and an Apostle of the Gauls.

It might be objected that, since the same concerns our Souls' Salvation, this mystery should have been plainly described. It is not necessary to put the food into the raven's mouth. Let him fly to it! Thus, also, was it not necessary to reveal this mystery otherwise than through the three Faculties. But why this was not necessary I shall tell you as little as those have told who have gone before me. I may have erred in communicating to you as much as I have. It has been done for your sake, because I see you are a Christian man, earnestly seeking the Truth. For what I have revealed to you is more than I would to others. Accept this as an indication of my mind towards you --- for you have not deserted my brother in his need. Therefore have I thought it my duty to communicate to you, before all others, what God (without any boast of mine) has given me. Also, do not think I have written for anyone's hurt; above all, not to injure the learned, to whom I would do all the good in my power. I have written for the simple Truth's sake, and for your benefit, and therefore beg of you to accept it with a single mind. Most cordially commending myself, etc., etc.

---

# **An Explanation of the Natural Philosopher's Tincture, of Theophrastus Paracelsus**

**By**

**Alexander von Suchten**

Doctor of Philosophy and Medicine

The ancient teacher Hieronymus says that it was formerly ordained among the Jews that no one under the age of 30 years might read the first Chapter of Genesis. Be this true or not, it is certainly not the custom among the Jews at the present time. Yet it is undeniable that man by a right contemplation and understanding of this Chapter, may gain a knowledge of many Arcana and secrets of creation. Not to mention other things, this Chapter is especially suitable to our Chemical Art. Indeed, of all books concerning the Theory and Practice of the Philosopher's Stone, I know not of one which, from beginning to end, could more plainly and graphically describe our Art, than the Almighty Himself has done in that whole process of His great Creation. Since, however, Theophrastus diligently, and above all others, in his book, *Tinctura Physicorum*, followed in the way prescribed by God, and in the aforesaid book has sufficiently described both the matter and Practice --- or handiwork --- both of the Ancient Philosophers as well as of his own new corrected opinion, I will in this place substitute no other practice, but simply give a short Guide for better understanding of his book in order that beginners in this Art (I write not for the learned) may, by diligent study, and God's Grace, attain to, not alone an understanding of the above Theoretical Firmament, but also the necessary manual skill in this Art from beginning to end.

Theophrastus, in describing this our philosophical work and creation (which is nothing other than a small world, since in it appear the participation and similitude of all things), follows the same method as Moses in describing the creation of the Great World. For, before Moses treats of the matter, he enumerates the three principles which indistinctly lay therein, but which, by God, were distinctly developed from the same. So also does Theophrastus, for, before giving the matter of his work, he indicates that, although it is one thing, three things lie hidden in it. These must, by fire or water, be extracted, and again be united into one being and substance, according to Christ's saying: "He who knoweth not to extract many things from one thing, the same knoweth also not to make one out of many". Now, Theophrastus says: "The matter of the Tincture is One Thing that, by fire, has been extracted out of three". This is to be understood as the general consensus of all philosophers. What Theophrastus here affirms, Geber also substantiates. There is one Stone, one Medicine, to "which we neither add, nor take from it, anything".

Bernhardus says: "There is a single root from which the two Mercurial Substances and our whole work are extracted or made".

Morienus says: "The first and principal substance of this thing is one, and out of it is one thing".

Agadmon, in the Turba, testifies also: “Therefore dismiss all plurality, for Nature is content with one thing”, etc.

Hermes, a father of all philosophers, also says in his Tabula: “Even as all things have been born from one, by the mediation of One, so also all things have been born from this one thing, by adaptation”.

Hercules especially agrees with Theophrastus, saying: “This Magisterium proceeds from one root, which afterwards is expanded into several things, returning again to one”. (See *Pandor.*, fol. 8,706.).

From all of which the Truth and foundation of this Art is apparent, for Truth is where there appears no contradiction.

Therefore also can false Alchemists be easily detected in this one point alone.

And since God Almighty Himself has created the whole great World, all Celestial, Animal, Vegetable, and Mineral Natures from one single thing and primeval root, how should Man be wiser than God, and for this work --- which, not less than the Great Outer World, contains within itself the seed and qualities of all creatures --- use more than one thing.

For the said Art --- according to the testimony of Gerrariensis, Chap. 22 --- should imitate Nature. The matter of Art will be the matter of Nature and, since the matter of nature is unique, viz., the origin and matter of metals, therefore, also, the matter of Art will be unique. The Book of Genesis relates that this primary matter was of a moist nature, or water, for, when diligently reading the text, although the three principles are first enumerated, viz., Heaven, Earth, and the Spirit of God; yet there soon follows the matter out of which God created Heaven, viz., water, which God took and divided into two parts of pieces, as you will hear. Hermes, or Mercurius Trismegistus, although an Egyptian priest, without enlightenment from God, may yet have derived great wisdom from writings perhaps left behind by Moses after Exodus. Hermes names not alone the matter from which all elements are drawn, a moist nature, but alludes pointedly to the division. (*Pymander*, Chap. I.). This Word (Spirit), moving over humid nature, cherished it. But ardent and light fire straightway flew out from the bowels of humid nature; also light, air, obedient to the Spirit, took the middle place between fire and water. Earth and water lay mixed with each other, so that the face of the earth might nowhere appear, being drowned by the waters. Then these two were separated by the Spiritual Word”.

Also Plato: “Water is the principle of the universe. For, from water are all things produced, and into water all reduced”. Hermes calls water the principle of all things. Theophrastus is herein of the same opinion, except that he does not expressly call matter water or moist nature. But he says it is composed of three substances, calling them here an Eagle, a Lion, and a Golden Glitter.

In *Liber Metamorphoseos* he terms them: Mercury, Salt, and Sulphur. That is just the opinion of Hermes and other philosophers, speaking of Spirit, Body, and Soul. (See *Key of Chemical Philosophy*, by Dornaeus, fol. 411). How, now, these three can, by the artist, by means of Vulcan’s art, be extracted and freed from their prison, and

again be united, will follow later. Remember, for the present, that he calls the one thing, from which shall be born the great and also the little world, a Red Lion. Had he desired to indicate it more plainly, he would have called it a moist nature, or water. He does this to prevent the unworthy from sharing this secret with the worthy. Other philosophers have exercised the same caution. For it is written, "This stone is hidden both from men and from demons". But it is called a Lion on account of its great strength and power. For as a Lion is the strongest and fleetest animal, mastering the other animals, and therefore compared to a king of beasts --- so also, amongst things created, there will not easily be found a fleeter, stronger, more penetrating thing, subjugating, occupying, overcoming, and ruling, without exception, man and others.

Hermes confirms such swift strength, saying: "This matter is the strongest strength of all strength". This is also experienced by those who know this Lion, and by proper preparation have been instructed how to use it upon other creatures. Then one sees after what manner this thing occupies, conquers, destroys, kills all things, even changing them from one form into another, nothing being exempted from its rule or unterrified by its roars. Hence by philosophers it is named the Animated Thing. Hermes says: "Behold, it conquers every subtle, and penetrates every solid, substance!". For this reason Dionysius Zacharias calls it a Governor, and Bernhardus a King. For there is nothing that can bear so much rain, wind, work, heat, or cold, while it can be conquered or killed by nothing --- except it be by water --- as those know who have had such monsters in their keeping. Therefore it may be rightly named a strong Lion, by reason of the temperate conjunction of the Elements. For those Elements are separated and purified, and alternately married in a suitable manner, there being generated from them a Tempered Substance, which the Violence of Fire cannot separate, nor earth's corruption vitiate, nor the muddiness of Water condemn, nor the contact of Air cloud. In order that one should not imagine such Lion to be a strange, rare thing, he, Bernhardus says: "This Lion is named by many but known by few". And it is true that it is at the present day carried about by all sorts of men in their mouths, although few, yea, only those whose eyes God has opened to Nature's virtues and powers, can recognize and use it. Yet in its substance, nature, and matter it is so common, often-used a thing that Bernhardus says: "The whole world have it before their eyes". Morienus asserts it to be so universal that Man could not live without it. Verily, "I declare to thee", quoth he to King Calid, "that this Thing by Divine Will has been greatly used in Creation, and nothing made by God can exist without it". Every person knows this thing, and whoso knows it not, he knows nothing else. I should like to see a child of 7 or 8 who is not acquainted with it, and is without a hearty appetite and desire for it immediately he beholds it. This inclination proceeds from man's inner spirit, which well knows that all power to preserve health and long life are hidden in his one thing alone. And, in order that this substance be revealed and made known, he gives you another hint and sign whereby you yourself may recognize it, saying: "Such matter is the Greatest Pearl and Noblest Treasure upon Earth according to God's Revelation and man's desire". These words are literally copied from the Lesser Rosary, which says: "For God has under Heaven created no more precious thing, except the rational mind". Examine one after the other all creatures, you will find among them all no more precious, better, more lovely, or nobler creature created by God. An intelligent man can easily find bottom here by diligently observing the above explanations, together with the Sympathy and Disposition (Diathesis) of God's creation with respect to man's natural life. I will let the above instances and the guiding of Theophrastus suffice, and now refer you to our Author's

little Book, *De Viribus Spiritualium*, where he speaks of the Spirit of Life. There you will find that the Spiritus Vitae, or man's life, is itself a celestial, invisible vapour; it is the temperament between the Elements, and is included in the Stars and all Heaven's influences as far as the firmament stretches. Cornelius Agrippa, in Book I, "*Concerning Occult Philosophy*", and the Spirit of the World, teaches how and by what means such Spirit is attracted from the Stars into nether corporeal bodies by their Magnetic Force.

Richard, the Englishman, also teaches the same fully in his *Corrector. Alchy.*, Part V, Chap. 8 and 9: "When you have now found which most abundantly partakes of this Influx and Spirit of life from other, the same you may use for your work, and apply it by right means and preparation, using its Spirit for the strengthening, preservation, and augmentation of you own spirit. This is more than enough concerning the matter".

Now he comes to the preparation, and to the before-mentioned three principles, saying: "That this Lion, by Nature's aid and the artist's art, may be transmuted into the White Eagle, and thus, out of one, two are made".

Here the Author has wished to signify that, in this Art, man must follow the rule left him by God, the First Chemist. For, God having created all Creatures and Elements out of one thing, viz., Water, it follows that He began by making two things out of the original one thing. The first He has taken up on high, making of it a heavenly water; the other was gathered together below, and by coagulation became Earth. St Peter, II, Chap. 3, briefly mentions these three principles: "By the Word of God the Heavens were of old, and the Earth standing out of the Water and in the Water". Esdras, Book 4, the last chapter, says: "For God hands the Earth over the Waters by His Word".

Thus also in this work the Artist must divide his process into two parts:

(1) By distillation conduct one part on high, making of it a clear, heavenly Spiritual Water, here called a White Eagle. For, as no bird is so keen-sighted, or soars so high as the eagle, so also we know of no water so volatile, so penetrating, as this, for it ascends to the Heavens; and, as the Lion's father and son, penetrates his bone and marrow, as we shall presently shew. Our Eagle is the true key to human renovation, and the bath of new Birth and Rejuvenation, as saith the Psalmist: "Like the Eagle shall thou renew thy youth". It is a white transparent Water of heavenly colour, according to Alanus and Bernhardus, and hence is by many called Heaven (*Coelum*) by reason of its lofty qualities.

This Eagle is the first part of the water which ascends on high, the *Ascendens* of Hermes mentioned in his *Tabula*.

Esdras, Book 4, calls it: "The Spirit of the Firmament". Other philosophers term it Water, Spirit, or Soul of the World, the Middle Nature which is a quasi-body and quasi-not-soul, and quasi-soul and quasi-not body. It is the ligament and vinculum of all Elements --- also, the one universal, generative Nature, dispersed through all the parts of the world".

And, since it has its center in the Supreme Circle (as being very light), whence also it came in the First Universal Generation of things, so when freed it ascends towards

Heaven to its Centre. Above it has been called Humor Lunae, or the Humid Radical of all Creatures.

Compare Aurelius Augurellus, Book I, "*To the Lion*", 10.

For this (Anima Mundi) is diffused everywhere,

And everywhere is active;

In the winds of heaven, in the earth, and the bosom of the wide waters.

They enclose the Soul, by which all things of earth do live. Thence the world itself derives its life. But, since the Sol is trammelled by no body, and the world, and all parts thereof, are in material form; therefore, between these two the Spirit is the intermediary, which is neither body, nor Soul, sharing in both these natures.

Therefore in this live and increase Sea, Air, and Fire. This, embracing all things. Is always the Bird (Eagle), always the root, ever bringing forth and perpetuating life.

At length, imprisoned in yellow gold, itself seeks the hand of the artificer, who may loose its bonds, and, by its virtue, become powerful.

(2) The other part of the water --- or of our Lion --- according to the teaching of Moses, became corrupted and dry. That is now the second part of our Art, viz., the investigation of the substance of the Lion, when the aforesaid Eagle has been hatched out from his body, by warmth, as from an egg, and has flown away. To speak plainly concerning it, it is the dry, waste earth, and the cursed earth in Gen. V. It has its first name of Lion by reason of its aforesaid strength and sharpness. For, as a lion has sharp teeth, biting through that which he seizes, so also is this earth so sharp as to be unbearable on the tongue because of its penetrating nature. It cannot be touched without offence so the tongue, as saith the philosopher. Elsewhere Theophrastus calls it "An invisible, consuming fire".

Bernhardus retains its name of King, and says: "Although Fontin, the aforesaid Eagle, is the King's Mother, yet is the King nobler than Fontin". For, although he always retains the name of Lion, yet is he changed from his first nature, is no longer a virgin, but has been fructified by the Spirit brooding over the water --- his original first substance --- and has borne a heavenly, spiritual fruit, viz., the aforesaid Eagle. Hence these verses:

A virgin, not one day old,  
By Nature's decree espoused a man,  
And, before she had reached the age of one year,  
To this man a child she bore,  
Yet she died before she was born.

And in The Song of Solomon, Chap. VIII, "I raised thee up under the apple tree, there thy mother brought thee forth; there she brought thee forth that bare thee".

Hermes calls the inferior substance gross or descending. For, being heavy, it has, and seeks, its center in the lowest circle, as it were, subject to the superior heaven and its influx, or the Soul of Middle nature, or Mundane Spirit. Above it has been called by its right name of Solar and Natural Heat of all corporal and natural things.

Now, as to the third principle, viz., the Spirit brooding, etc. It is, according to Theophrastus the Glitter of Gold. For this Earth is but the real fine Gold, left imperfect by Nature, to be perfected by Art, as Ferrariensis says (Chap. 64): “The terrestrial parts are nothing else than the occult gold of philosophers”.

Other sages define it as “The Soul of the World, whose colour is golden”. Now, since in the first Universal Creation, the third principle, the Spirit of God, has never been separated from the other two, but the two have remained in one as the Spirit above, and in the water, so also is it in our microcosmic, particularistic, and philosophical Creation. We cannot obtain this third principle, this golden flitter, this beautiful gold-red colour, separate by itself. “It shines not to the Spagyus”, saith Theophrastus, i.e., it conceals itself and is lost when one is made into two. What, then, becomes of it? According to Gen. Chap. 1, and the opinion of philosophers, it remains with the aforesaid water, and since that water ascends towards heaven, this Golden Glitter must accompany it in its center. Theophrastus, however, considers that it remains with the earth, perhaps on account of the Old Testament saying that the Soul is in the Blood, wherefore the Israelites were forbidden to eat it.

Now, it should be noted this Golden Glitter, as the third principle, is often called the Soul, and cannot be produced other than as a red, thick, stagnant blood --- sometimes called the Lion’s Blood by our author --- and Theophrastus ascribes it to that body which, in the first distillation, goes not over out of the retort (crucible). For herein, say Alchemists, is the whole art, that the gold go out of the retort. And this is true did they but understand the Gold and its Glitter aright. How the glittering spiritual Soul of this third principle --- when duly extracted from the Lon’s body --- hovers above the water, and there yet remain two in one, you will hear afterwards. For the soul cannot exist, out of its center, as an impalpable, invisible entity without a body. “For a spirit is neither visible nor palpable, except it hath assumed a body from some Element. Hence this spirit --- by reason of its noble nature --- receives a Body in the highest and noblest Sphere of the Elements, viz., in the Igneous Sphere. Yet, in the fire, this spirit loses not its nature, neither is it Fire, nor of an igneous nature; although it dwells in Fire, and by many is called Fire of Nature”.

Aurelius Augurellus hath these words in his second book: “But another elicits these various hidden parts from pure Blood, and has ordained the Elements to lead them forth;

“That thus these occult spirits might perchance be seen or touched with the hands, or enclosed in a vessel.

“For otherwise they would straightway penetrate the vessel, although imprisoned in hard atrament.

“By violence can no Spirit be forced to remain in any part of the Vast Orb, so greatly does it rejoice to dwell quietly in its own habitation:.

Such external Body is the Lion, or dry earth, which retains its redness, its outward aspect, its stagnant blood, which has no exit, the body being not yet open --- as one sees in those hanged or suffocated, who stifle in their blood --- as the Book of the Trinity relates in Figures. Raymundus Lullius says briefly, in *Testamentum Novissimum*, thus: “My son, Quicksilver is water distilled from its earth, and similarly earth is Animated Quicksilver, while the Anima (Soul) is Natural Heat which is bound in the primary Essence of the Elements of Animated Mercury.

Now that this jewel has been presented to you through the Faculty of Philosophy, you have a short guide to the teaching of Theophrastus. Having taken the right philosophical matter, you are now to extract from it two things contained therein, viz., the Eagle (Mercury), and then the Body (the Salt), which, as Everlasting Balsam, contains also the third thing, the Spiritual Soul, the Golden Glitter, or true gold seed. These you shall extract according to the counsel given in Ovid by Medea to Old Jason, who would become young again, viz., that he --- by Anatomy --- should divide his limbs, and, reuniting them in a warm bath, he should become younger and of great strength.

But that you may apply the theory, and learn the modus operandi whereby from Unity, two things, and from two, three are obtained. Theophrastus comes to the Practice. “It is the mark of a wise man first to know the causes before putting his hand to the task”. Theophrastus shews you two ways --- one Ancient, the other discovered and used by himself --- saying the Ancients had a very long way “before accomplishing the aforesaid separations and achieving their object”. In the beginning they, out of a Simplex --- or also out of a Subjectivum like God Himself --- and also Theophrastus, have made two things, viz., Water and Earth”. And he continues to say: “that Artists have to these two Simplices given the name Lili --- afterwards using the said Simplices and not one”. But know it is indifferent whether you, in the beginning, use one or two things. If our matter is found in one thing, it will equally well be found in two (Nature having already converted the original One into Two). Such simplicity of the subject Ferrariensis describes well, Chapter 12: “The first radical Element, whence all the Elements derive their origin, is Humidity, or Water, i.e., liquefaction”. Or, according to others, it is the earth.

Shortly after he says: “For the Beginning of the World there is One Sole Element, which is Primary Matter, from the Division of which, by reason of opposing qualities, were generated the four Elements, which were in it potentially”.

Aurelius Augurellus, Book II, says:

“Besides within there is ordained a double force,  
Which always acts and suffers,  
As a female and male when together ---  
Even as a chicken grows in the shell,  
By the action of the one and the suffering of the other in turn,  
And by cherishing heat externally applied”.

If you begin with one thing you must first make two of it. But, by taking two, such as Earth and Water --- Nature having educed this Binary from one --- you are saved the trouble, and have only to generate the third, which, as aforesaid, is always hidden in

one of these two. Thus Lion's Blood is the Bride around whom they dance, viz., the natural red Sulphur or Seed of Gold, ordained by God and nature to bear its like. But, being mixed and bound up too much with earth and superfluities, it cannot perform its office, except it be freed by one of Vulcan's smiths from all bolts and bands of its natural prison. Therefore have both the Ancient Sages and Theophrastus taken great pains to liberate these Captive Souls from their Eternal Darkness by the Descent to Hell of our Heavenly Eagle --- according to Isaias: Those in darkness and the shadow of death see a great light. Thus have the Ancients united the two things, and, after a month's putrefaction, extracted the spirit, that is, the water, with gentle fire by distillation. For this water will not stand a great fire, and if vexed with the same it becomes impatient, angry, and wrath to such an extent that it "knocks all of a heap", as Bernhardus says, the residual matter they treated with strong water until the same went over as a dry spirit. Compare Solomon's Song, II. C.: "Who is this that cometh out of the wilderness like pillars of smoke, perfumed with myrrh and frankincense, with all powders of the merchant?"

Now, this dry spirit is the substance or body of the Lion himself, the sharp earth, the old, miserly, jealous man, who breaks not willingly into the treasury, or likes to give up his golden-yellow oil, and only by force will let his palace be plundered. It is called a dry spirit by reason of the quantity of dominating fire therein, which is none other than the true philosophical Sulphur, as Bernhardus relates in the *Book Concerning the Transmutation of Metals*. But sulphur is none other than the pure action of Air and Fire, heating and digesting, or decocting, Earth and Water proportionately and homogeneously to themselves. Richardus, the Englishman, also says: "Philosophers' Sulphur is a simple, living Fire, vivifying and maturing, and nothing but a hot and dry vapour generated from the purest terrestrial dryness in which Fire rules in every way".

Now, since all the oil or spirit does not go over at once --- in order that none of this gold seed or potable gold as the Lion's greatest treasure might remain behind --- they moistened the corpus mortuum (residuum) with spirits and, after a month's putrefaction, again distilled over as at first, thus obtaining more of the oil. This moistening, putrefying, and distilling they repeated until the earth was wholly dissolved, and had given up its entire treasure, all the gold having distilled over and become a Mercury, i.e., Water, which has its coagulation or its sulphur in its depths, as Geber says: "Our Mercury has in its depths fixed Sulphur, and nothing sinks in it except Gold". Dionysius well describes this process in this Practice: "After the Governor of the Firetown (oven, furnace) had retreated, his remaining warriors had long fought the enemy with fire, until they escaped the said enemy by retreating over the water and bridges which they had thrown up behind themselves".

That is the same thing that Aeneas did with the tree bearing golden branches. As often as he broke a branch off two grew in its place. Those are the lovely golden-yellow drops falling from the beak of the retort into the receiving vessel, one dripping down after the other, until the Lion has lost his whole heart, blood and strength. For that is the true Lion of Judah, sent by God to deliver His Peoples from their enemies and sins, in pain and torture to shed His Blood for them. The wound in His Side, whence flowing two long streams of Blood and Water, shall be a Fount of Purification to all those drinking therefrom. In these shall such water become the spring of a long, healthy life.

Bernhardus goes on to relate that the Ancients --- having got so far that nothing further distilled over from the earth --- they again purified the water and oil, removing all remaining bonds, until they at length reached the Pure Fount, and the true, beautiful, golden leaves of the Golden Book. Here are our Adam and Eve naked, for their eyes are opened, and now they see themselves, what was good and bad in their own substance. This is the Rectification whereby they cleansed these two of the accidental impurities of the first Distillation (for the unclean Spirits guarding the treasure in the earth love not to leave the same). This is the first process of our Philosophical Birth, the Returning into the Mother's Womb, whereby the Rule of God is followed, and the first precepts of chemists are fulfilled, viz., the Reduction into Primary Matter, into the Three Natural Principles, i.e., Animated Spirit, Mercury, and Sulphureous Vapour of Earth. Thereby are separated the Elements and the Pure from the Impure, and, finally, the Seeds of Gold are brought from the Darkness to Light, which is nothing less than the Generation of Nature in the Generation of Metals, and The Process with Double Smoke of Paracelsus. But the above method entailed heavy expenses and much time and labour, all of which the Ancient Sages could have avoided, and obtained the Lion's treasure by a shorter cut, had they enquired into the matter as diligently as Theophrastus.

Now, I wot there is no one who would not wish to know this shorter method; and that you may not have to complain of Theophrastus, he shews you another short way, admonishing you also to let the above tedious process be, and to take from the Lion nought but his rosy blood, and from the Eagle the white gluten. These two bodies you must coagulate together and bring into one body, as it were male and female seed.

Now, someone might object thus. Dear Theophrastus, that is the old story which I have heard long ago. The Ancients took nothing more than the Lion's blood and water, and coagulated them. Yet you tell me the same is a brief way to obtain the aforesaid two Mercurial Substances, with little labour and in a short time.

Well, that is true so far. Theophrastus is not so clear here as he might be. But you may easily imagine what the mode of preparation must be if you have diligently studied Theophrastus's other books and preparations, and are otherwise experienced in Chemical labours. You will then find that Chemistry, in the preparation of all arcana (secrets), has two methods, viz., Distillation and Extraction. Whatsoever is to be prepared by Chemistry and brought into its Arcanum, its Tincture, or Quintessence (in which is the power and virtue of all creatures), or is to be cleansed from impeding impurities, that must be done by Distillation or Extraction (which is the same as Solution). There is no other means. As Bernhardus says: "The King never goes forth except the Fountain attract him".

Now, having already heard that he rejects the tedious process of much distillation and purification by reason of its expense, etc., you perceive that he must have used the only other means, viz., Extraction by Solution.

According to Calid, son of Jazichus: "Solution is the Extraction of the Interior of Things to their Superficies, so that the hidden become manifest". Hence his (Theo.'s) meaning is this: When you of one thing have made two --- or have taken two things differently constituted by Nature --- let the old process alone; take from the Lion his blood only --- i.e., cut out his heart with his own sharp spear --- or as Bernhardus

says: “Slay the King with his own sharp, poisonous Mercurial Water”. In plain words: Extract but from the earth its Tincture or Arcanum, and the blood, the sunshine, the dry spirit immediately all distills over. By such extraction or solution more will be done in a few hours than the Ancient Sages could effect in six months. By the above process the whole work may be completed in ten or twelve months, in which time the Ancients could barely achieve the first step --- i.e., Reduction into Primary Matter --- as all those know whom God has enlightened, and thought worthy you know this Solution and Extraction.

But misunderstand me not! I speak here, not of the second solution of the earth, but of the first solution of the crude body.

How this solution and extraction is effected it behooves not to tell here more plainly -- - as our author says --- not to put the food right into the bad birds’ beaks. As the saying is: He who would reach the open sea must first pass through the narrow straits. That is the blessed place of which Esdras writes (Bk. IV, Chap. 2): The path to it is narrow, so that but one man can walk on the same. On one side is Fire, on the other Water. He who would inherit or possess these good things must first undergo much trouble and danger until he finds the narrow footpath between Fire and Water, and pass over. Now, having revealed this to you indirectly as far as may be, I would refer you to other philosophers. Remember Geber’s rule: “That no Solution should be made, except in its own blood, and that calcined things are more soluble than non-calcined. For, by calcinations, they are reduced to the natures of Slats and Alums, which alone are soluble”. If you are a true searcher after knowledge, the above will tell you more than too much.

Compare Aurelius Augurell., Book 3: “First, taking thin plates and filings of pure gold,

“Thou shalt crush and pound them into the form of fine powder, or river sand, with frequent blows:

“Until, at length, they become liquid, dissolved by putrid humour from within themselves.

“It will be well here sometimes to pour in large quantities of liquor of their own seed, but by no chance anything foreign”.

This is also the aforesaid short process of Theophrastus, whereby you, in a short time, and with little trouble and expense, may find the two said things (of which one is the Father, or Sun, or Red Water, and the other the Mother, or Moon, or White Water) which are necessary for the perpetration of the miracle of the One Thing, and for which good counsel you owe Theophrastus many thanks. Thus, by God’s help, is effected the first step of this process, which is done by the hand through Sublimation and Purification. By this the fleshly, corporeal Adam is killed, and Body, Soul, and Spirit, by the natural death, are separated from one another.

**Second Operation: Conjunction ~**

Now follows the second operation, in which are brought about, by rest and without labour, the fixation and stability of those things which are sublimated and purified. This is the Resurrection from the Dead, in which Soul, Body, and Spirit, after Purification, come together again; and --- on our philosophical Last Day --- will arise as a new glorified body and a new spiritual man without blemish and sin. In this conjunction of Resurrection are comprised the whole spiritual body and the soul, and thus form One --- even as water mixed with water --- and are not separated in all Eternity. For in them is no diversity, yea, a Unity and Identity of all three substances, Spirit, Soul, and Body.

Even so it is plain concerning the Identity and Unity of the trinity in God the Father, Son, and Holy Ghost, which in the Deity are One and the Same, with distinction and diversity in substance.

The aforesaid process would have been no use to the Ancients, or to Theophrastus, had they not known how to bring to fruition, in its due season, the seed thus obtained. But, in order successfully to effect this, they had again to learn from Nature, and more especially from God as a Preceptor, in Genesis, Chap. 2, for there it is written thus: Although God had caused the earth bring forth all kinds of grass, herbs and trees, yet they could produce no fruit or propagate and increase their kind, until God had first let rain again upon the earth, the water first separated and taken up to heaven by Himself. And daily experience teaches us that the earth, when dry, is barren, and that nothing can grow unless frequently refreshed by rain and dew. Hence God has again united the water --- which He, as the first Distiller, took up on high --- with the dry earth, the Inferior with the Superior. The Ancients, following this rule, have often united white water with the Red Lion's Blood, as with the Earth (for, coagulated, such blood is earth), according to the teaching of Hermes: "It ascends from the earth into heaven, and again descends to earth, and receives the strength of inferior and superior things". And elsewhere: "Red Sun is father, White Moon is mother; join them together in one life and disposition". Morienus: Make the Red Smoke hold the White Smoke in a strong embrace and in a strong vessel, without exhalation of spirits".

Theophrastus also means that, when you have obtained the two things by the short method, viz., the rosy blood and the Eagle's white gluten, you shall thereto add nothing foreign. Compare Solomon's Cong, chapter 1:7: "Tell me, I thou whom my soul loveth, where thou makest the flock to rest at noon, for why should I be as one that turneth aside by the flocks of thy companions?". Take these two things alone, and of them again produce Unity --- of two Mercurial Substances make one --- like body and soul. Of two waters make one by coagulation. For Quicksilver, or our Mercury, is not coagulated by the coagulation caused by extrinsic mixture (except for corruption); but the same is, by its intrinsic Sulphur, coagulated to perfection. This is the Union of Heaven and Earth, the marriage of Adam and Eve, the Conjunction of Sun and Moon, the right Union of the World's Soul and Spirit with the Earth by the Union of their Centres, as Calid says: "Of all experiments there is none equal to that of conjoining two or more things whose centres are diverse, unless it be the conversion of their matter, and the mutation of their substance and properties from their original nature. Therefore, he who shall be able to change Soul into Body and Body into Soul, and to mix with the same subtle spirits, shall attain all things".

Compare Aurel. Augurellius, Book III: “Perchance here thou mayest seek the numbers and the weight of the things required by the for perfecting this work.

“Remember, therefore, there are of Things Primordial but Three.  
From these take two; and from these again --- if thou judge rightly – one more.  
The Triple Thing will then consist of Gold alone.  
The decocted substances will form one homogenous mass.  
For, joined together, they differ among themselves in nothing.  
Each ingredient fuses its mass with that of the others”.

By this influx our earth is made fruitful, producing in due time all kinds of animal, vegetable, and mineral natures. This is the warm bath in the beginning of may of Bernhardus, expressed of old in the following figure of speech: “The Water of the Air between Heaven and Earth is of all things the Life. For, by its moisture and warmth, it is the medium between water and fire. The Heavens opening rained and dewed these Waters upon the Earth, rendering it moist and sweet as honey. Wherefore also the Earth blossoms, bringing forth divers colours and fruits; and, in the midst, there has grown up a great tree, with silver stem, stretching to the ends of the world; on its branches have sat many birds which have all flown away towards the East; and the raven’s head has become white”. All the above means but the spiritual generation and new birth of our Adam, through Water and the Spirit, for the same, in its former nature and earthly tabernacle, could not enter the Kingdom of heaven. Our old Adam must first put on its original pure nature, and thus, born again through spiritual water, and changed into a spiritual man, may, through much tribulation, enter the Promised Land.

### **Coagulation and Imbibition ~**

But how can such things be?, asks the learned and wise Nicodemus. Art thou a Master in Israel, taking upon thyself the highest works in Physics, and knowest not that? Well, Theophrastus tells it to you plainly in Chap. 3, viz., that it is done through the Pelican (for this is the grave in which shall rest our deceased Adam until his resurrection), even unto the third and fourth time, until the whole Lili, both matters, earth, and water, are dry on the ground. The words, “for the third and fourth time”, are to be interpreted as indicating the frequent rainfall necessary for fruition.

The ancient philosophers in their Small World, following Nature’s example, have been wont to divide the white water (which they first produced from their matter) into two or more parts. The first portion they quickly coagulated with the Lion’s Blood, by circulation in the Pelican, according to the formula: “Nature knows Nature, Nature rejoices in Nature, Nature receives Nature, and yet there is but one Nature, One Genus, One Substance, and One Essence”. Song of Solomon, Chap. 3:4 --- “But I found him whom my soul loveth; I held him and would not let him go, until I had brought him into my mother’s house, into my mother’s chamber”. To this coagulated, dry earth they have added the other portion of the water, moistening and drying by heat three or four times, until the earth has again received into itself the whole of its white water, and thus the whole Lili has become a dry body, Thus the ancients augmented the stone for fixation in the very beginning. Bernhardus says: “The king’s bath may be repeated. For the more frequently he be bated in such saline, Mercurial water, or sulphureous baths, the purer and stronger does he become. It is optional to do this three or four times in the beginning with coagulation, or only once. By

frequent moistening you will get more fruit, also the further advantage (by augmenting in the beginning) of not having to do so at the finish”.

For the highest degree of purification, wash seven times in Jordan, and you will have many cwts. of water as your reward. Compare Solomon’s Song, Chap. 1: “Draw me, and we will run after thee; the King hath brought me into his chambers: we will be glad and rejoice in thee”.

For our multiplication (according to Raymundus) is nought but the reiteration of the process of our primordial creation. So also Bernhardus, in his book Concerning the Transmutation of Metals: “As in this process nothing extraneous enters into its first composition, so also the same multiplies nothing that is not if its first composition” But since all generations and corruptions in nature are caused by heat; and, especially since Nature, in the bringing forth of metals and earths, has no other instrument but a steady, gentle heat, therefore, also, all imitators of this art have be obliged to follow Nature. The steady warmth of the sun ripens every fruit, and the warmer the sun (yet not too dry and alternating with due rains), the better do fruits mature and turn out.

Hence the ancient sages have ever matured this our philosophical Seed by the heat of a sun shining steadily upon our earth and water, in which the other two are included, for “the virtue of fire and air cannot become apparent except in earth and water, virtue only acting through matter”. And, as the great world’s sun in summer gets hotter and hotter, until it has reached its highest ascension in the Zodiac, so also have all artists always augmented their “little Summer” in temperature until the matter, having been duly boiled and simmered, from black (through various changes of colour) became blood-red. We can assist our matter by heat alone. Hermes says: “Fire is the Regimen”. And Bernhardus also states: “That no one goes with the King to the bath but the stoker, whose sole duty it is to keep up the heat, and that his work is easily inflammable”. Ferrarianus is of the same opinion: “The whole strength lies in the fire. By this we discern and unravel the four Elements in that gross mass. By this we further join and combine things into one. By this we imitate the Sun, and perfect the imperfect”. In such warmth it attains maturity, ordained but never completed by Nature. For (quoth Theophrastus) Nature brings nothing complete to Light, but man, by spagyric preparation, must lead up to that ordained of Nature. Hence it is said: “Where Nature ends, there Art begins”. And: “Through God was our Philosophical Stone by Nature created, and to the same there is nothing wanting but purification and perfection”.

It also learns to fight with the fire, so that the same --- however great --- may gain no advantage over it. Compare Farrianus: “It rejoices in its own fire, just as anything, Vegetable, Animal, or Mineral, is better preserved in the place of its generation than elsewhere”.

### **The Foundation of Art ~**

The contents and foundation of this Art consist in dissolving gold and silver by the right means --- with water, or drying with fire of the volatile Philosopher’s mercury -- - until the same be changed into a powder which cannot be again reduced to a solid body. This powder --- if it smokes not when laid on the fire --- tinges every imperfect body and mercury with a lasting gold or silver colour. The gold colours not except it

be first changed by the white gold --- i.e., by their Philosopher's Mercurial Water --- into a black substance they call their earth and caput corvi crow's head), giving the same many names, which white gold is further changed into a vapour, and is our Fortified Spirit.

*Question* --- Whether in the Antimony of Philosophers or marcasita the Philosophers' secret is hidden? He white gold is the secret, for out of the antimony of our black earth is extracted the highest arcanum of Philosophers, which is in effect a ruby liquor, sweet, and red as blood.

The Salt of Metals is the Philosopher's Stone. Hence make salt of the metals without corrosives.

"Adam", said God, "in fixed and not fixed, in these two lie hidden all Secrets: Thou art the Lesser World".

Abel has written, that his father Adam gave names to all things.

Noah praises the oilstone (soapstone?) saying there is no stone possessing greater virtues.

Attain, therefore, in time a spiritual earth, not fleeing from fire: Because, among all elements the earth alone is fixed, and the Art of Alchemy wished that its Stone be fixed. Hence it is necessary that at the end of the operation all things should return to earth, i.e., fixation. Hermes' dictum is true: Its strength is integral, if poured into the earth. In such coction or digestion divers colours are to be seen, not less than in Great Nature in the earth.

For when the wet winter is passed, when the sun shines again, and the earth, during winter covered with water and snow, becomes dry, all manner of curious colours are seen, especially thee, viz., black, white, and red. Between these appear divers colours, as a yellowish colour after the virginal white or red; but this is not permanent. The other yellow remains longer, yet not so long as the black, white, or red. Crauser says, in Turba: "Know that it is a twofold thing to make white and red; the one thing is solution, the other decoction". The former takes place in winter, when the earth is covered with snow and water, a certain indication of Putrefaction, a sign of commixture and of the changing of one thing into another, and is the colour of death. Solomon's Song: "I am black but comely, O ye daughters of Jerusalem, as the tents of Kedar, as the curtains of Solomon. Look not upon me because I am black, because the sun hath looked upon me!".

The time of its duration is unequal. In the Bible one finds that the waters of the Flood lasted 156 days.

Bernhardus says: "In 130 days the King puts off his blackness, and appears in his white shirt". Scala Phil. gives 140 days for such putrefaction. Vide Pandor., fol 36. After these follow the other perfect colours, as the white of complete coagulation. Thus, putrefaction takes place in humidity, but the end of putrefaction is dryness; and inceration is a gentle induration, the occultation of humour, the fixation of spirit, the collecting of things diverse, the Renovation of Homogeneity, the adaptation to fire of

things fleeing therefrom, and is the colour of regeneration and of semi-coction. It lasts also a long time --- according to Bernhardus almost 82 days --- which is a sign of fixation according to the Dictum of Lucas in the *Turba*: “When our Magnesia is white it lets not the spirit go from it”. Theophrastus sets no limit of time to such colours, as, in truth, none can be set, for it depends on the matter.

Compare Aurel. Augurell., Book III:

“Ye scarcely will anyone so exactly compute the years,  
As not either to diminish or add to their number”  
For suitable material will sometimes accelerate the process, and unsuitable retard the same.  
Or intense heat will by a little exceed the measure, but water by much.  
And time and place will vary”.

The time will vary according as the artist tends his fire diligently or not. For this our work is a true woman’s or cook’s work. They simmer and boil and roast until the spit is done to a turn; they wash and dry the linen in the sun until it is snow white. Also this white colour is like unto the earth when dry; then the corn soon gets white also, and is no far from maturity, viz., from the third colour, the yellow. As soon as the same appears in the corn it is cut; the winter is past, the rain over, the flowers have appeared, summer is come, and the turtledove is heard in our land. Thus also is the maturing of our matter, when its yellow colour appears, As regards its metallic nature, and the perfection of the same, we must bring that to a higher grade, says Bernhardus, viz., to its red colour, that it may thus communicate to other imperfect metals some of its superabundant perfection. For this redness is the sign of incorruptibility and complete digestion.

Just so Christ became more than perfect in the highest exaltation of His humanity through His rosy blood, in obedience, in fulfilling and satisfying the Law, and in love towards God, in order to communicate to us, His people, to its fullness, through the Holy Spirit, whereby we might become heirs and sharers of His Kingdom. In this our Elias goes up to Heaven in a storm and seated in a fiery chariot. Now go forth, ye daughters of Jerusalem, and behold King Solomon crowned by his mother on the day of his marriage and of his heart’s joy. Every diligent student will now, without further explanation, be able to find these colours. Consult the philosophers concerning the same: Bernhardus, Scala Phil., etc., etc.

Attention must, during such coction, be paid to the proper order of the colours produced, for with them change the qualities of the active agent, demanding a corresponding mutation in the passive reagent. For, in our solution, the water is first active, the earth then attracting the King, but in coagulation it is passive. This change of mode cannot take place without development of divers colours, which is expressed by philosophers thus: “Heat acting on moisture generates blackness, and, acting on dryness, generates whiteness, in which redness is hidden.

Solomon mentions such coction and colours in his Song, Chap. 5:10 --- “My beloved is white and ruddy, the chiefest among ten thousand. His head is as the most fine gold, his locks are bushy and black as a raven. His eyes are as doves’ eyes by rivers of waters, washed with milk and fitly set. His cheeks are as a bed of spices, as sweet

flowers: his lips like lilies, dropping sweet-smelling myrrh. His hands are as gold rings, set with the beryl: is belly is as bright ivory, overlaid with sapphires. His legs are as pillars of marble, set upon sockets of fine gold". The ancient Sages have also mentioned the same in parables, as when they saw a mist rise in the distance (possibly the mist that watered the whole earth). They saw also the violence of the sea and of the water-floods upon the face of the earth, that the same stank in the darkness (putrefaction). They also beheld the King of the Earth sink, and heard him cry with a terrible voice: He who delivers me shall live forever, and rule in my glory on my royal throne, and all things shall be given into his power (i.e., blackness). On the following day they beheld above the King a most beautiful morning star, and the light of day illumining the darkness (i.e., whiteness), the bright sun rising through brilliant clouds of various forms and colours (i.e., yellowness and redness). Then, in fullness of time, the King was crowned with three costly crowns, of iron, of silver, and of pure gold. In his right hand they saw a scepter with seven glittering stars, and in his left a golden apple, upon which was sitting a white dove, with silvery body and golden wings.

But particularly is the frequent imbibition (moistening) of dry earth with water described and indicated in complete parables --- (Philosophers have given this process of imbibition many other names, such as Exaltation, Fermentation, etc., but they are all one, viz., the subtilization of White and Red, and the augmentation of excellence and quantity). They beheld a man, as black as a Moor, stuck fast in a black stagnant bog, to whose assistance came a young woman, beautiful of countenance, and clad in bright apparel. Her back was adorned with glorious white wings and golden feathers, and on her knees she wore fine pearls. On her head she had a crown of pure gold, set with a silver star, around her neck a necklet of gold, set with precious stones, and on her feet golden shoes. From her proceeded the most sweet scent, above all aromas. She clothes man with a purple robe, inspires him with highest wisdom, and leads him to heaven. By diligently exercising yourself in suchlike parables, and --- at the same time --- paying attention to the works of Nature in the great generation, you will not only be able to await a plentiful harvest in due course, but will so increase the store of you philosophical oil, or tincture, as to be sort of vessels into which to pour the same; even as the widow of Elisha. Thus shall you be free from debt and feed your house in plenty; for your meal shall not diminish nor your cruse be wanting.

There is nothing said here of the fire whereby this artificial coction takes place. Perhaps it is the everlasting fire, of which many Alchemists boast, the fire used aforetime by the Jews for their burnt offerings, which burnt continually without becoming extinguished, which also was hidden by the Prophet Jeremiah before the first destruction of Jerusalem, and afterwards was discovered by Ezra. The same is said to have been thick and oily, like oil or honey, as Josephus describes it. If you can and will prepare I, good, If not, refer to the Turba, Chrysippus, etc., for they will give you a good account, saying that this fire may be prepared in many ways, always taking care not to let the active principle escape, or, as Bernhardus explains it: Not to let the bath take fire, and flee away like a fugitive eagle, thus causing a dissipation of seed and preventing generation. "For then the Elements will not combine, but will vanish by fire, on account of the strength of the spirit and of the dominating and operating volatile thing; so wilt thou become poor, and lose that which thou hast".

Hence the "triple vase" commonly used by Philosophers. And the "old hollow oak split through the middle", viz., the oaken sphere of Bernhardus, in whose middle is

the clear stone, in which stood the bath. All this was done to ward off the too strong rays of the Sun, that our male and female seed might, without hindrance, remain together to the birth: "For the separation of active and passive necessarily prevents generation".

Compare Solomon's Song, Chap. 2: "I charge you, O ye daughters of Jerusalem, that ye wake not my love till he pleases".

When Theophrastus further speaks of Hungary, Istria, the South, or Cyprus, he gives you to understand in which countries our matter ought to be sought, and he leaves it to you whether you will have two different substances which, as regards their genus, are of one and the same nature. Therefore, seek the one, the Lion, in Hungary; but the Eagle in Istria. But if you rule your work through one thing, thus proceeding from Unity to Duality, and thence to three things, then travel to Cyprus. There you will be refused nothing.

Bernhardus has traveled yet farther, saying that he fetched his man, viz., the chosen jewel, the golden book, from India. Christophorus Parisiensis also went far for the same, and says: "When you quit the town of Venice, go far to the right until you find a pleasant level country: there is our Mercury". Whether in liquid or coagulated form, it is best to obtain it from the above-mentioned places, by reason of its beautiful red colour. Although found also in Germany and other countries --- Theophrastus saying elsewhere that of the perfect Medicine enough is found in Germany --- yet the native article is not so good and strong as the foreign. "For the virtue is dispersed, and less united, therefore less strong. For here masculine and feminine are substantively the same, and in the one subject are combined different and contrary virtues, since our Lion is hermaphrodite".

If you use but one thing, make of the same two, but, lastly, of one of these three. Afterwards for these three build a tabernacle, and diligently take heed that the sacred Threefoldness be reduced through Duality to Unity, the Author of all consummate perfection. So from our New Earth and New Heaven (the old Earth and heaven having been destroyed by fire, together with their works) you will have a New World, the Holy Place, the New Jerusalem, as a bride for the bridegroom, wherein all tears, lamentation, and sorrow shall be no more, whose gates also are adorned with all manner of precious stones and pearls, the streets are of pure gold like unto a beautiful mirror, and the names of the dwellers therein are all written in the Book of Life.

There all things are new, for the former things have passed away; and, as Hermes briefly says: "Thou shalt have the World's Glory and all thy desire".

Finally, as regards the utility of the Medicine thus prepared, the same is sufficiently described in other books. That this medicine is of great use with respect to the health of the human body may easily be gathered from the aforesaid Medicinal Foundation. For this our philosophical Son, a Son of Sun and Moon, which rule the whole world, as a learned Astronomer has traversed all planetary spheres and the whole firmament in his colours. He also is born out of the Adamic clay (which is an extract of the Fifth Essence --- quintessence --- of all creatures and of the whole world), ascending to Heaven and descending thence to Earth, and thus acquiring all power and might both in Heaven and Earth. Hence he is a Lord over all Animal, Vegetable, and Mineral

Natures, and can act according to his pleasure, and the same with his influence --- especially on man as the Microcosmus --- if applied to man's Spirit of Life in an appropriate affinitive Vehicle.

But, as regards his other powers and influence over the metals, a means is necessary whereby to reduce, punish, and humble his rebellious people. Theophrastus here indicates as this means. Our Stone is first to conclude unity and friendship with the same, i.e., they are both to be fused together.

Aurel. Augurellius says likewise, in his third book:

“First mingle a little of the prepared medicament with the yellow metal, and thou wilt presently see the same take to itself the strength of the Blessed Powder.  
Or, when thou shalt have collected again, by great and difficult art, the teeming seed from the pure gold,  
Then quickly mix with it an equal portion of purple powder,  
And warm the same with gentle heat, simmering for two months;  
In which space of time thou mayst behold produced the whole series of colours,  
Which, otherwise, thou hadst marveled to see in three years.  
As often as thou repeatest the operation again and again, so often shalt thou increase the virtue and quantity of thy powder”.

But he conceals the important point, for this fusion suffices not, if such molten matter be not heated during the proper time in a vessel with philosophical coction. For by this means the operator obtains full power over his Lord the King, thereupon reducing the subjects to obedience, as related by Dionysius Zacharius, a knack unknown to many operators, who have consequently not known how to set about the projection. For, although our Stone of itself colours, yet, according to Theophrastus, it does this less than when the Medium of Incorporation and Ingression of the Stone --- i.e., Fermentation --- is added.

Different philosophers have used different Media, each according to his own opinion. Farreanus, Berhardus, Roger Bacon, etc., etc., having some applied augmentation by means of repeated solution, others by fermentation. Use which you will; either will lead to the desired result. (Vide *Pandor.*, Fol. 252). But here I call a Ferment a Stone already complete in its elements in comparison with the metals; Even as the ferment of dough overcomes the dough, converting it into itself, so also this stone converts metals into itself, just as dough is changed and converted by its ferment, because it derives its origin its ferment, because it derives its origin from the same, and not from anything foreign. Thus, also, the Ferment of metals is of their own substance, changing into itself. And since metals are generated from mercury and Sulphur, therefore, also, this ferment is generated from them; and because this our Ferment is of the form, nature, and digestion of gold, therefore, it will reduce metals to the nature and digestion of gold. For the form of individuals of the same species is one alone.

As regards its third use, our Stone matures all immature precious stones, and brings them to their highest perfection. For this I refer you to others, being of opinion that such great gifts are given by God to man more to assist his neighborhood by works of charity than to enrich himself. Would that man recognized the resources of Nature and God's wonderful wisdom in the implanting of such powers in His creation! Then, by

means of this Igneous Sulphur or Lion's Blood, or Philosopher's Stone, he might attain the highest Rubinical Gradation of all Jewels, as well as the White Eagle, making large pearls of small ones; and finally, might perform all philosophical works by the processes Theophrastus describes as digesting or putrefying sublimating or distilling, calcining, extracting, fermenting, etc., These are the steps by which you may attain to wisdom and to Solomon's throne, on the right hand of which are found long life and the tree of life, and on the left, riches and honour. That is, says Theophrastus, the object of our art, viz., long life and the honourable maintenance of the same in this vale of tears.

Now will I briefly recapitulate to you the whole process: Take first thy golden Man, thy red Adamic earth. For this earth is the middle nature between Mercury and metals, and the third composed of the same principles, Quicksilver and Sulphur. By noiseless metallic liquefaction of this earth the matter of its metallic ore acquires, virtues, and properties of the aforesaid principles, so that from it may be generated each and every metal, according to diversity of digestion; and to it is there nothing wanting but purification and complete digestion. This Red Adam lay in a warm bath that he may go to sleep. If he will not fall asleep, give him a good, strong, sleeping draught of his saturated liquor, which he loves to drink. Then, during his sleep, cut open his right side that the fair white woman, concealed within him, may come forth. When, now, this maiden has become marriageable, bring her to Adam --- lying on his bed and sick with love --- as his bed and sick with love --- as his daughter, sister, and wife. Whereupon Adam will know the woman, and she will become pregnant. Take then this pregnant woman --- letting the man go --- and guard her well for ten months, until the day of her parturition. She will then bear her first-born son, whom she has conceived from her father's spirit, a young spiritual Adam, to whom no other man is equal in deeds and miracles, who --- if daily fed with his young mother's milk --- when he reaches man's estate, will subdue all his brethren, will deliver them from death, and bring them to eternal death, and bring them to eternal joy in the kingdom of Honour, in which all creatures under heaven will rejoice with joy unspeakable. And, finally, the whole world will become full of gold, and pearls, and precious stones. For Solomon's vineyard bears him 1000, and to those that keep the fruit thereof, 200.

---

## Corollary Concerning Hyle

To say what Hyle is, is not puerile. Hyle is the primary matter and the Philosopher's Stone. Azoth is the seed of all metals, when it is extracted from magnesia and Silver.

Hyle is the Beginning of all things, a confused mass and primary matter, which is neither moist nor dry, not earth nor water, not light nor darkness, not air nor fire.

Philosophers' Mercury is nothing else but a water or fire, both Elements having long been digested together with natural heat, resulting in a dry water, This Mercury is not common, but the Stars in the Firmament by their influence cause it to grow in the earth, the Quintessence of the Stars influencing the terrestrial Quintessence. You can drive them both into a water, and extract them therefrom, and they are to be observed in the Rainbow or Sun's reflection.

---

## Another Corollary

by

Conrad Poyselius

Take the strongest red subduer of men (cinnabar, red Mercurial earth) you can obtain, as it comes out of the earth. The Istrian, Candian, Hundraian, or Spanish kinds are the best. Distil the same three times, yet not too quickly, and put aside this thrice distilled spirit. Then of Red Royal Alum put several pounds into a vessel and calcine to blackness or greyness; pound also, and dissolve in warm water. Then extract the water per Alembicum, or evaporate in an open vessel till dry. Calcine again the residue, and again extract until it yields no more salt. Dissolve this salt, and coagulate for the third time until it ceases to yield a residue. Of this oil take one pound, place the same in a Waldburg or Hessian crucible, and set in a blast furnace until it fuses; add more oil if necessary. Allow it to fuse 24 hours in such furnace (if the crucible stand fire so long, even to three days); then take out and place in another crucible; fuse again, a repeat this operation a third time, The result will be a hard, green stone; pound the same, when warm, to pieces, place in a retort, and pour upon the stone of the above thrice distilled spirit three fingers' breadth. Set it, well closed up, upon hot ashes for three days and nights. Then the Vegetable Spirit, or White Eagle, will extract the Green Lion's rosy blood, and the superfluity and impurity will remain behind, partly as a scum and partly as a black, stinking oil or pitch. The scum swims upon the Aqua or Spiritus Vitae, and the red blood upon that, like oil upon water. Pour the essentiated spirit into a glass, away from the scum and black residue (weigh the glass first).

The residual Stone can be further dessicated until it have an oily or dry consistency. Use the same for Calculus, Asthma, and other Tartaric diseases. The aforesaid Green Lion's Blood is the true Philosopher's Oil, above all aromas, always fixed and unalterable in fire. After remaining in the fire for a whole year it is still undiminished, looking like melted wax, as Geber testifies, saying he had seen nothing stable in fire except the viscous humidity, which is the root of all metals, and the true primary matter of Minerals, Animals, and Vegetables, as you, with God's help, will yourself experience.

Now, observe, when you have placed your Red Lion in the aforesaid weighed glass, distill the Eagle off in a bath, or over warm ashes. Collect the spirit by itself, putting away the phlegm, and you shall have the Lion's Blood in the form of a fixed, stable, white salt. The Eagle goes off unwillingly, invisibly taking over the Anima or Soul in form of a sweet volatile salt, losing also its original scent. If you now will continue, and reach the desired goal, by God's help, take of the residual salt one part, and of the animated spirit three parts. Place in the aforesaid glass, in such a way that the third part of the same remain empty --- as described by Poyselius in *Splendor Solis*. Seal hermetically, and, in God's Name, place in a vapour bath, giving it such warmth as an egg, or a child in the womb, requires. You will then behold within 40 days how the soul, lying in his spirit, again assumes its body, and is the only medium for the reuniting of body and spirit. When the matter begins to get black, then the conjunction goes on between the two, for this blackness is the body, or fixed salt, the passive thing, dominated by spirit and soul, and can be fused by no force of fire. As Bernhardus says: They wondrously love each other, and, although, in the beginning,

the fixed body may be overcome by the spirit and soul, yet it is so strong, and of so incombustible a nature, that they cannot kill it, but when it finds the soul and spirit pressing it so hard, the Lion feels its old strength, and takes away from them the dominion. Before passive with respect to Soul and Spirit, it is now active as regard these, converting them into its own nature, and producing a true and clear substance, called the true, white Magnesia. But every intelligent artist may imagine for himself what various colours must be exhibited before this result is attained, how also it must be brought from one extreme to the other, viz., from white to black, and vice versa, which can only be done in several months. For Bernhardus says: "And I saw black clouds, but they lasted long; and, for the fire's sake, you must not alter the temperature until necessary, when it shall have coagulated into a grayish, white ash. Then you may increase the fire until the yellow appears, continuing to augment the temperature until you behold the desired perfect redness". But it is unnecessary here to state the whole procedure. Read with diligence the *Tinctura Physicorum Solis* of Poyselius, Raym. Lullius, Bernhardus, Chrysippus, Farriarinus, Chris. Parisiensis, Morienus, *Rosarium Majus*, *The Epistle of Arnold de Villa Nova*, Marlinum, the *Book of Three Words*, the *First Part of the Breaking Day* (not in print), and the second part thereof (in print), There you will find what is wanting here. Praise God, and succour the poor.

---

## Here Follow Certain Notable Facts Concerning the Philosopher's Stone

Rebis is making one thing of two. That is, philosophers' gold and silver --- i.e., the Philosopher's Stone --- make a sulphur called philosophers' sulphur, and the secret of secrets. Gold generates gold, i.e., when Medicine is to be prepared, then it is projected over gold or silver, and it is projected over gold or silver, and it is the required Medicine. Then, the whole is projected over other, imperfect, bodies, and thus like generates like.

Philosophers' Mercury --- i.e., water out of the salt of metals --- is none other than a body dissolved in water. Aqua Vitae (Water of Life is the same as Permanent Water, and is a spirit extracted from a body; it is called Aqua Vitae and Quicksilver, and of it are all things are made.

The spirit and soul are extracted from the body. The body was dead. Restore to it its soul! Then will it live and not die eternally, and then from these is made the stone which perfectly coagulates Mercury. The matter of the Stone is Philosophers' Salt, and Philosophers' Salt is Sulphur of imperfect metals.

The matter and form of the Stone: The form of the Stone is the same sulphur is the same sulphur of gold or silver reduced to oil, with which the matter is incinerated, as aforesaid.

---

## **The Four Degrees in the Regimen of Fire**

19. The first degree is that which permits of the hand being held to it, or is a temperature equal to that of a midsummer's day.

20. The second degree is that which permits the hand begin held to the fire but a short time.

21. The third degree is that which produces no red glow, and causes not wood to carbonize in the heated sand.

22. The fourth degree is that which makes wood carbonize in the heated sand, yet produces not a red glow.

---

## Concerning Salts

Take of Lime of Metals, 1 drachm, and of Aqua Vitae, without phlegm, 4 drachms; cause them to boil gently 48 hours --- or place in the Sun six days. After the sediment is deposited, pour of the clear liquid and distill. You will then have Salt of Metals, but not yet fermented; for it must be fermented with Oleum Lunae to whiteness, and with Oleum Solis to redness. Likewise: of all things in the world --- after first being reduced to ashes --- there can be made a fixed Salt, fixing and really tingeing every metallic body. All salts have the same efficacy as dissolved Mercury. Likewise, Incineration is effected thus: Take a white or red stone, at the same time somewhat congealed and powdered; place over a fire, and, when the said salt is a little heated, add a little of the powder, with sulphur or Oleum Solis and Lunae, continually, until the mixture be a sort of thick honey. Then take of the fire and colour; and thus so with all salts. Salts are softened by dissolution in fire, and then by alternate solution in and recrystallization out of clear water.

---

## Concerning Common Salt for the Purification of Aqua Vitae

Take of Common Salt, prepared by solution and coagulation, and let it be many times dried; pour on it Aqua Vitae, and distill with a strong fire, the more the better, and it will be rectified, dissolving gold. It ought to be distilled with salt at least three or four times.

Also: Pour out common salt, coagulate, and dissolve in common fresh water, repeating this until it be purified, and be obtained in crystalline form. Also: Let Antimony --- and the other things not destroyed by combustion in the crucible --- be dissolved in spirits of wine and distilled four days. Then extract therefrom the Salt and Oil.

Note: Philosophical Fire --- which is called Nature and Soul --- can be extracted from all natural things, and is of their nature and condition, because, in earth is earth, in water is water, in air is air, in fire is fire; neither has it causes of corruption nor contrary qualities.

Also: Of every Salt can a Tincture or Elixir be made, because an Elixir can be made of all things in the world, as has been said above, and hence also of Tartar, which Salt is a natural thing.

Also: The Philosopher says: The Spirit enters not except by water, i.e., by Salt Water and the Regimen of fire, because whatever is dissolved out of Salts is done over a gentle fire, and whatever is dissolved by means of Salt Water remains, and is not altered. Hence, if you would be enriched, prepare Common Salt and Alkali, and reduce them into pure, sweet water, which is preparative and incervative water, in which --- if thou shalt have decocted the whitened spirits --- it will rectify and whiten the same, extinguishing therein all blackness.

To be noted: Prepare Salts; make them liquid and commiscible with bodies, and --- if thou wouldst be enriched --- prepare especially Sal Alpoli. For its property is to retain volatile things, and hence they are more quickly liquefied and collected. For, whatever has been dissolved out of Salts over a slow fire, should afterwards be distilled over three times with a very slow fire. The residue in the still should be removed and preserved, and the said water be again redistilled until perfectly pure water passes over. In the fifth distillation the water will be pure, and then it is finished, as the Philosopher says. When you obtain water from air, and air from fire, and fire from earth, then you have the whole Art.

From the above it is patent that salt enters not a body, neither are bodies mixed with it, unless the salt be made liquable, nor are those complexionable unless the saltiness be purged away. Then will it be an Elixir, a most limpid Condiment, like the Coagulum of Milk. For the dryness of salt is the calcinative and parcher of all bodies and spirits. But the property of water is mild, purifying and rectifying bodies and spirits. Take care, for it is a light sort, that thou mayst collect gold and silver perfectly pure, for it rectifies and perfects whitened spirits.

By boiling thou mayst obtain many things wherewith to coagulate Mercury and change it into perfect silver. Hence the Philosopher: If Quicksilver be joined to its own kind, it will doubtless flee away, but if quick when fleeing, suffering another union with water, it bears fire and hammer.

Praise God in thy soul for what I have said, and praised be God who hath placed His Wisdom in Salt! Work with the same and thou shalt prosper.

---

## Here Follow Some Philosophical Rules or Canons Concerning the Philosopher's Stone

What we seek is here or nowhere.

1. Canon: The nearly perfect is easily brought to perfection.
2. Imperfect things by no art can put on perfection, unless first purged from impure Sulphur and earthly grossness, which are mixed with Mercury and Sulphur; then are they accounted a perfect Medicine.

It is wholly impossible to render imperfect bodies fixed without the Sulphur and Spirit of the perfect ones.

4. The Philosophers' Coelum (Heaven) reduces all metals to their primary matter, i.e., to Mercury.
5. Those attempting to reduce metals into Mercury without Coelum Philosophicum, or metallic Aqua Vitae, or Tartar of the same, are greatly deceived, since the impurity out of other solutions swimming in Mercury is perceived by their own eyes.
6. Nothing is perfectly fixed, except it be indissolubly joined to a fixed substance.
7. Fusible gold may be mutated, and changed into blood.
8. To render silver stable it must be reduced neither to a powder nor to water --- for this would destroy it utterly --- but it must of necessity be reduced to Quicksilver.
9. Silver cannot be transmuted into gold (except Physica Tinctura), unless it be reduced to liquid Mercury. The same is to be said of the other metals.
10. Imperfect bodies, as well as silver, are endowed with perfection, and converted into pure gold; and this is done with white or red sulphur by the virtue of a suitable fire.
11. Every imperfect body is brought to perfection by reduction into Mercury, after decoction with sulphurs in an appropriate fire. For out of the same are generated gold and silver; and they are deceived and labour in vain, who try to make gold and silver in any other way.
12. Sulphur of Iron is the best, for thus, joined to Sulphur of Gold, brings forth a certain Medicine.
13. No gold is generated, except it have first been silver.
14. Nature compounds and prepares its minerals by a gradual process: and thus at length from one root it procreates all metals to the last limit of metals, which is gold.

15. Mercury corrupts gold, changing it into Mercury, and rendering it volatile.
16. The Stone is composed of Sulphur and Mercury.
17. If the preparation of Mercuries be not taught by an experienced artificer, it cannot be learnt from books.
18. The preparation of Mercury for the philosophical menstruum is called Morification.
19. The practice of this great work remains our Grand Secret or Arcanum, and unless it be revealed Divinely, or by artificers, or in experiments, it also can never be learnt from books.
20. Sulphur and Mercury are the ingredients of the stone. Hence a knowledge of Mercury is necessary, to select the best Mercury for the speedy perfecting of the Stone.
21. A certain Mercury is latent in every body, but the art of extraction is most difficult.
22. Mercury can only be changed into gold and silver by an abbreviation of the long process.
23. Congealing and fixing necessitate but one and the same operation, in the same vessel, and with the same substance.
24. What congeals and fixes Mercury also colours the same, in one and the same process.
25. There are four degrees of fire to be observed in the process. In the first Mercury dissolves; in the second Sulphur dries up Mercury; in the third and fourth Mercury is fixed.
26. Things radically mingled in their minutest parts afterwards become inseparable, like snow mixed with water.
27. Different Simple Substances exposed to putrefaction give different products.
28. It necessarily behooves form and matter to be of the same species.
29. Homogeneous Sulphur is of that Mercurial Nature which produces gold and silver, not in the form in which they are perceived by the eyes, but in which Mercury is dissolved.
30. Without Philosophical Solution of Gold in mercury, there cannot be extracted from gold the certain fixed unctuousity which acts the part of a ferment generating gold and silver, The same is effected by a short method described by Geber.

31. Metals resolved into Mercury are again reduced to their original form by admixture of a small portion of this
32. Coelum, or Tartar of Philosophers, which reduces all metals into Mercury, is metallic philosophers' Aqua Vitae.
33. Sulphur and mercury consist of the same homogeneous nature.
34. The Philosophers' Stone is none other than gold and silver endued with a more than perfect tincture and excellence.
35. Gold and silver contain in themselves a superabundance of riches, which --- by preparation and digestion --- should be changed into a ferment, whereby the mass may be multiplied.
36. The greatest extremities in Mercury are two, viz., exceeding crudeness, and exceedingly exquisite decoction.
37. Philosophers hold it as an axiom that every dry thing quickly drinks up the humidity of its own species.
38. Lime of Silver altered quickly drinks up its Mercury, the fundament of the minerals of Philosophers.
39. Sulphur is the Soul, Mercury the Matter.
40. Mercury, placed with the sulphur of imperfect bodies, is coagulated into an imperfect body, being transmuted into that imperfect metallic species, the sulphur of which is coagulated and concreted
41. It is wholly impossible to make gold and silver with the sulphur of imperfect bodies. For nothing can excel that which it contains within itself.
42. Mercury is the feminine seed and menstruum of all metals, suitably prepared by the good operator's Art. For, by the projection of the great work, it receives and transmits the qualities of all metals, even to gold.
43. As Red Tincture is elicited by the ferment of gold alone, Mercury can be animated only by the white ferment of silver.
44. The Philosophers' work can be carried on without much labour or expense at all times, in every place, and by all, if only the true and sufficient matter be forthcoming.
45. The sulphurs of gold and silver stand the spirits of their species.
46. The sulphurs of gold and silver are the true seeds, feminine or masculine, of the Stone.
47. Everything conferring the virtue of stability and permanence necessarily possesses this virtue itself.

48. The tincture imparting perfecting to the imperfect derives this perfection from the fount of gold and silver.

49. Those are deceived who accept Venus as sulphur.

50. Nothing has been granted by Nature to Venus which answers for the great Spagyric work, or which will serve in the making of gold and silver.

51. Note: Gold converted into Mercury before conjunction with the menstruum, can be neither spirit, nor ferment, nor sulphur, and is good for nothing.

52. The work brought to an end by reiteration cannot again be made hot.

53. In abbreviating the work perfect bodies should be reduced to liquid Mercury and dry water, when they will easily assimilate the ferment.

54. The preparation of Mercury effected by sublimation is the more excellent, and by it (after revivification) is amalgamation more easily and better carried out.

55. The Soul cannot impress the Form, except by intervention of the Spirit, which is gold transmuted into Mercury.

56. Mercury receives the form of gold through the medium of the Spirit.

57. Gold resolved into Mercury is Spirit and Soul.

58. Philosophers' Sulphur, Tincture, Ferment, designate one and the same thing.

59. Common Mercury is the equal of and nearly approaches the Nature and Similitude of all other Mercuries.

60. Ferment renders Mercury heavier.

61. If Common Mercury be not animated, it is unsuitable for philosophical purposes.

62. The Soul is already impressed on Mercury properly mortified.

63. Gold may be prepared in a ferment, so that one part shall animate ten parts of Common Mercury, but this work has no end.

64. Mercury if imperfect bodies holds a middle place between common Mercury and that of perfect bodies; but the art of extraction is most difficult.

65. Since Common Mercury, by projection of the Stone, can be changed into gold and silver, it can be made equal to all Mercuries of the Bodies.

66. Animated Common Mercury is the greatest secret.

67. The Mercuries of all metals, by abbreviation of the work, are changed into gold and silver.

68. A humid and gentle heat is called by the name of Egyptian fire.
69. It is worthy to be noted that Luna is not the mother of common silver, but a certain Mercury endued with the quality of the celestial moon.
70. The Metallic Luna (silver) is of masculine nature.
71. Common Mercury, from cold, assumes the nature of a sterile woman.
72. The Mercuries of semi-minerals bear in their nature a similitude to Luna.
73. All things are produced from Sol and Luna, viz., from two substances.
74. Male and female --- i.e., Sol and Mercury --- coalesce into one.
75. Common Mercury, without preparation, is unsuitable for the work.
76. Four parts of Mercury and one of Sol --- i.e., of the ferment --- constitute the true marriage of male and female.
77. The solution is complete when Sol is resolved into mercury.
78. Without putrefaction is no solution perfected.
79. Putrefaction extends and continues even unto whiteness.
80. The great Arcanum is the maturing of the spirit, by which is prepared the menstruum, for in the same is Sol dissolved.
81. Mercury dissolves gold into water of its own form, i.e., into liquid Mercury.
82. Dissolution is the principle of congelation.
83. Gold transmuted into liquid Mercury, remains but a short time in that form.
84. Ferment dessicates Mercury, rendering it heavier and sable.
85. Sol (gold) is called the Philosophers' Fount.
86. Matter, by force of putrefaction, is converted into pulp or mud, which is the principle of coagulation.
87. The long method is the open secret of Philosophy, but it is a veil and an evasion.
88. There is a certain short method by which the Sulphur is removed from gold and silver, whereby every Mercury is permanently changed into gold and silver.
89. When matter attains blackness of colour, the second degree of heat must be applied.

90. Philosophers' Laton is the similitude of fire, for that alone perfects and excels all things.
91. Poison and stench are removed by fire, without other addition, and it alone cleanses all things.
92. Fire, by its penetrative and acute virtue, purifies and matures a hundred times more than water.
94. The Spirit is heat.
95. Matter, when brought to whiteness, refuses to be corrupted and destroyed.
96. All corruption of matter is marked by deadly poison.
97. The glass, or vessel, is called the Mother.
98. The virtue of Sulphur is not extensive, except to a certain limit of proportion, neither can it exceed an unlimited weight.
99. The question is to be observed, wherefore Philosophers call the matter of the Stone a Menstruum.
100. Sulphur merits the name of form, but menstruum that of matter.
101. Menstruum represents the small and inferior elements, viz., Earth and Water --- Sulphur, the two superior ones, viz., Fire and Air, as the masculine Agent.
102. Thou canst not hatch the chicken by breaking the egg-shell; similarly, thou canst have no result by opening the vessel and exposing the matter to the air.
103. The Calcination, by means of Mercury in a blast furnace, excels others.
104. The Philosophers' mode of speaking must be diligently noted. By sublimation they mean the dissolution of bodies into Mercury. By the first degree of fire they mean that which the second operation follows, viz., the inspissation (thickening) of Mercury with Sulphur. The third is the fixation of Mercury into a perfect and dissolved body.
105. Infinite is the number of the erring who admit not that Mercury, as regards its form, when mixed with amalgamated chalk of perfect bodies, is the subject and matter of the Stone.
106. White Medicine is brought to perfection in the third degree of fire, which must not be exceeded lest the work --- for whiteness --- be destroyed.
107. The fourth degree of fire produces a red matter, when appear divers colour.

108. It is necessary that whiteness, no yet brought to highest redness, should remain imperfect, both as regards the white and the red tincture. Therefore it is left dead until it ends in perfect redness.

109. After the fifth degree of perfecting fire, the matter acquires new virtues.

110. The work attains not perfection, unless the medicine have been incerated and rendered fusible like wax.

111. The process of creation is repeated three times on a quantity of the Binary Mercury, which produces the Stone.

112. The inceration of white Medicine is effected with white water or Mercury animated by Luna; but the inceration of Red Tincture with Mercury animated by Sol.

113. After inceration it suffices for the matter to remain in the form of pulp or paste.

114. Repeat the inceration until it stands the perfect test.

115. If the Mercury, by which the Medicine is incerated, escapes as a vapour, the work has failed.

116. Medicine, rightly incerated, explains to thee the enigma of the king returning from the fountain.

117. Sol ---when converted into its primary water, or Mercury, by means of Mercury -- if it become cold, causes the work to perish.

118. Philosophers, taking matter prepared and concocted by Nature, reduce it to its primary matter, since everything returns to that whence it derives its origin, even as snow is inseparably resolved into water.

119. The Wise reduce years to months, months to weeks, weeks to days.

120. The first decoction of Mercury --- which Nature effects --- is the sole cause of its simple perfection, beyond which of itself it can rise very little; and it is meet to assist its simplicity by sowing our gold in its proper earth; this is none other than pure Mercury, which Nature has digested a little, and not perfectly.

121. But by this second decoction Mercury becomes multiplied in virtue tenfold beyond its primary nature.

122. But the Stone Mercury is produced by repeated decoctions and mixing with Sol. Therefore, for this cause, man and woman follow twice.

123. By addition of Sol to Mercury it is converted into sulphur, and then by decoction into the Philosopher's Stone.

124. He who contemplates Philosophers' mercury but for a few moments, the same neither knows nor understands it.

125. Every Mercury, of whatever origin, exhibits the matter of the Stone, when treated in the right manner.

126. Everything from which Mercury is elicited is a subject of Philosophical Medicine.

127. Those who understand the Philosophers' Writings literally greatly err when they assert their Mercury to be One.

128. One Mercury exceeds the other in greater heat, dryness, decoction, purity, perfection; it ought to be prepared without corruption or loss of form, and to be purged from superfluities. In this consist the treasure and mystery of the Stone.

129. If the preparation of Common Mercury were known to students of Philosophy, no other Philosophers' Mercury, nor Metallic Aqua Vitae, nor other Mercurial Water of the Stone, need be sought, since the preparation of Common Mercury includes all these things.

130. Every Mercury of Metals and Minerals may, by successive stages, be raised, through the qualities of all other Mercuries, to the excellence of the Solar Body, and thence also be reduced to the degree and virtue of any metallic body one may choose.

131. Common Mercury, before legitimate preparation, is no Philosophers' Mercury, but after preparation it is called Mer. Phil., containing within itself the true method and way of extracting Mercury from other metals --- it is, as it were, the beginning of the great work.

132. Prepared Common Mercury is held to be Metallic Aqua Vitae.

133. Passive Mercury and Menstruum should on no account lose the external form of Mercury.

134. Those who (for philosophical work), in place of liquid Mercury, use sublimate, or calcined powder, or precipitate, are deceived, and err greatly.

135. Those who --- for the perfecting of the philosophical work --- resolve Mercury into clear water, err greatly.

136. To compound and make Mercury of limpid water is in the power of Nature alone.

137. In the Great Physical Work it is necessary that crude Mercury resolve Sol into Mercury.

138. If Mercury be reduced into water, it dissolves Sol into water, and, in the work of the Stone, it is highly necessary that it be dissolved into Mercury.

139. It behooves the Sperma and Menstruum to have servile external forms.

140. According to Philosophers, we should imitate Nature. Were, therefore, Menstruum dry, solution would be hoped for in vain.
141. The seed of the Stone should be in form similar to metals.
142. It is highly necessary to choose that seed of Philosophical medicine which bears Common Mercury.
143. It is the mystery of all mysteries of the Stone to know Mercury to be the matter, menstruum, and form of perfect bodies.
144. Mercury, of itself, brings nothing of moment to gradation.
145. Mercury is the Element of Earth, in which a seed of Sol must be implanted.
146. The seed of gold effects, not only the multiplying of quantity, but also of virtue.
147. Perfected Mercury, for the generation of the work, has need of a female.
148. Each Mercury is derived from, and participates in, two Elements --- Crude, from water and earth; decocted, from fire and air.
149. If any one wish to prepare and exalt Mercury into a Metal, let him add a little ferment, whereby it may be raised to the required metallic degree.
150. The highest mystery of the whole Work is the Physical Dissolution into Mercury, and the reduction into primary matter.
151. The dissolution of Sol should be effected by Nature, not by handiwork.
152. Sol, when joined or married to its Mercury, will be in the form of Sol, but the major preparation will be in chalk.
153. It is an open question among Sages whether Mercurius Lunae contained with Mercurius Solis can be obtained in place of philosophical menstruum.
154. Mercurius Lunae has a masculine nature. But two males can generate as little as two females.
155. When eliciting the Elixir, the purest substance of Mercury must be chosen.
156. He who wishes to be employed, let him be employed in the solution and sublimation of the two Luminaries.
157. Gold imparts a golden, silver a silvery color. But he who knows how to colour Mercury with Sol or Luna, the same attains to the Arcanum.
-

## Here Follows

### An Anonymous Treatise Concerning the Philosopher's Stone

My noble and dear Son, in order that I may communicate to you, in the briefest manner, my knowledge of the right, true, philosophical Stone, now know and understand that this Stone is composed of two things, Body and Spirit, to wit, male and female seed, that is, Mercurial Water and Corpus Sols, as may be read in all philosophical works.

And it is the general opinion that Mercury --- free from foreign admixture --- should first be dissolved in a spiritual water, called by philosophers primary matter of metals, Liquor Lunae, Aqua Vitae, Quintessence, with which water, or primary matter, the metals are delivered and freed from their rigid, frozen bonds, and are dissolved into their primary nature, like mercurial water itself. Hence philosophers, in their books, have illustrated their meaning by saying that ice dissolves into water by means of heat, because it was water before its coagulation. For everything is reducible to its primary condition. Therefore, also, philosophers have written that the species or forms of metals cannot be changed into gold and silver before being first reduced to their primary matter.

With respect to this regeneration of metals, observe well, my son, that the same can take place by means of the primary matter of metals --- i.e., mercurial water alone, and through nothing else in the world. For this water has the greatest affinity to metallic nature, so that --- after equal mixture --- it can never be separated from the same.

Therefore have philosophers, in the *Turba* and other books, indicated this water, saying: Nature rejoices in Nature, Nature preserves, improves, unites with, reduces, and exalts Nature. Hence it is necessary to know how to prepare the Blessed Water, which water is a fiery penetrating spirit, a philosophical water, and the hidden key to this Art. For, verily, without this water all Alchemy is vain. Therefore, my son, remember that the whole Fundament of the Philosopher's Stone consists in bringing to a new birth the primary matter of metals --- i.e., Mercurial Water, the perfect Corpus Solis --- that it be born again by water and of the spirit, just as Christ says: "Except a man be born again by water and the Spirit, he cannot see the Kingdom of God". So also here in this art, I tell thee, my son: except Corpus Solis be sowed, all else is vain, and there will be no fruit. Even as Christ says: "except the Seed fall into the earth and die, it shall bear no fruit". When, now, Corpus Solis has been born again through water and the Spirit, it grows up a purified, astral, everlasting, immortal body, bringing much fruit and multiplying after the manner of vegetables.

Concerning this Roger Bacon says: I declare unto you that if the Astrum (Star) turn its inclination to, and impress it on, this clarified gold body, I can nevermore lose its virtue and power. For the body is perfect, composed of, and agreeable to, all the elements. Therefore, my son, let him not attempt this Art who knows not of this new birth in nature, and this bringing forth of metals through the water and spirit of primary matter. For, believe me, all else is useless, vain, and deceiving. Hence

philosophers have written that: "Everything brings forth its like; and what a man sows that shall he reap".

Therefore says the Philosopher Richard, the Englishman: Sow gold and silver, that they, by means of Nature, may bring forth fruit.

Hence, my son, for thy work seek no other body but gold, as others are all imperfect. For gold is the most perfect of bodies, enlightening and vivifying all others, stable in fire, possessing a fixed, incombustible root; and, as Bacon testifies, one can alter nothing in the nobility and perfection of gold, it being free from all natural ferment, and no substance in the world is more perfect. Therefore, says Isaac the Philosopher: "The Stone can only be extracted from a perfect body, the most perfect in the world. For, were this body not perfect, how should we extract therefrom a Stone having power to give life to all mortal, to purify all corrupt, to soften all harden, and harden all soft bodies? Verily, it were impossible to extract to excellent a Stone from an imperfect body! Although many attempt it, yet they are fools". Therefore, my son, understand that the red, philosophical, Sulphur is a gold, as Richard testifies, and King Calid also states: "Our Sulphur is no common Sulphur, but is of Mercurial nature, stable, fleeing no water". Other Philosophers also bear witness that their Red Sulphur is gold.

Now, my son, the Sages say in their books that common gold and silver are not their gold or silver, since theirs are living, while the common are dead, and therefore incapable of imparting to others the perfection they themselves are wanting in. now, my son, those words of the Philosophers are true; it is impossible for common gold or silver to perfect other imperfect bodies, except --- as I have said before --- the Corpus Solis and Lunae be born again through the Water and Spirit of Primary Matter, and arise as a transfigured, spiritual, clarified, externally fixed, subtle, penetrating body, which afterwards shall have power to perfect and multiply imperfect bodies. Therefore have our Philosophers said: For this reason are such labours undertaken on our Stone, that its tincture may be improved, for our Stone must be much more subtle and decocted than common gold and silver. Bernhardus says: "We therefore take this body as created by nature. But it is necessary to more than perfect the masculine body by natural art in order that in its more-than-perfection it may render the imperfect perfect, by its superabundant fertility in weight, colour, and substance. And, if its perfection were not greater in degree than that imparted by Nature, what use would our time of nine-and-a-half months be?". Hence Arnoldus de Villa Nova, in his Epistle concerning our Stone, says: "The power and virtue and nature of gold and silver are in the Stone, else no gold or silver could be made. But the gold and silver in our Stone are better than the common, since the former are living. Hence Philosophers call the Stone their gold and silver, because the same are in it potentially and essentially, but not visibly". Euclides says: "A perfect thing is unchangeable. For example, bread. Bread, baked and kneaded, is perfect in degree and nature, has attained its final form, and of it can be made nothing but bread. Thus also with philosophical gold. Hence it is impossible to perfect other bodies with common gold, except the perfect Corpus Solis be again dissolved into its primary matter, whereupon it is converted by our Art into a veritable Ferment or Tincture, philosophers saying the process is not finished until Sol and Luna are joined into one body. My son, understand here the Luna Metaphorica, not the literal, since philosophers explain Luna to be of a cold, moist nature, giving the same definition also to Mercury. Hence

by Luna is understood Mercury, or Mercurial Water, or primary matter, which is the Philosophers' Luna, or Liquor Lunae of the *Clangor Buccinae*.

Now, my son, you have a short explanation why it is impossible to do anything in this Art, except we reduce perfect bodies, by philosophical fire or mercurial water, to their primary nature, which primary nature is a Sulphureous Water, and not Quicksilver as Sophists assert. For the primary matter of metals is not Quicksilver, by a sticky, sulphureous steam, and a viscous water, in which water are united in the three principles, Salt, Sulphur, and Mercury. Therefore it is necessary to know the Blessed Water of Mercury, or celestial, supernatural fire, by which bodies are dissolved and fused. This knowledge is the greatest secret and is revealed by God alone. For the Philosopher Bacon says: God Almighty has created man above Nature and all creatures --- although man is of Nature, excepting the Breath of God breathed into him at the creation --- and he shall be the lord of Nature's works. This Divine Spirit fashions the mind and thoughts of man, teaching him to perceive the first principles of Nature. The inspired Apostle, St Peter, tells us that the Earth and its work shall consume therein, and a new world shall be born, beautiful and good, as is described in the Apocalypse. Thence the Philosopher concludes --- like St Peter --- that the elemental world can only be destroyed by fire. Therefore, remember in this Art that fire is the instrument, according to Nature's example, and, next, understand further that this water, whereby Corpus Solis (gold) --- which, as Roger Bacon testifies, is a world perfectly created --- is burnt, destroyed, and melted, is not a common fire --- since common fire can neither burn nor destroy gold --- but a supernatural, inconsumable fire, which alone has power to burn gold and release it from its hard, rigid bonds. Also, my son, understand that this supernatural fire, possessing such power over gold and other metallic bodies, is alone the spiritual, sulphureous, fiery water of Mercury, in which Corpus Solis is fused and burnt; and, out of this melting and destruction, is again born and created a new world, and the Heavenly Jerusalem, i.e., an eternal, clarified subtle, penetrating, stable body, which can penetrate and perfect all other bodies. Hence Bacon says: "Just as a supernatural or elemental fire is that which disintegrates and fuses the elements of the whole world, and as the new Creation will be born from the mortal, molten elements, and will be an eternal Creation; even so has the Holy Trinity in the Celestial Stone also revealed to us a supernatural fire. My son, philosophers in their books have concealed this Fire, describing it in parables, and by countless names; in particular, they call it Mary's Bath, and a horse-dung, Menstruum, Urine, Milk, Blood, Aqua Vitae, etc.". Concerning this Fire, Bernhardus says: "Make a vaporous fire, steady, digesting, not strong, subtle, airy, clear, condensed, inconsumable, penetrating, and equable". And he continues: "Verily, I tell thee, all wisdom is in this fire, for the said vaporous fire performs all things". Hence he directs us to copy his words concerning this fire, word for word. Therefore, a wise man will easily understand that such words refer not to a common, but to a supernatural fire. Hence Maria says: "The Element Water makes white and melts bodies". Concerning the preparation of this fire --- which he calls menstruum --- Raymundus Lullius says in his books (which are *Testam. Test. Noviss.*, *Codicil*, *Anima Metallorum*, *Lux Mercuriorum*, *Liber Mercurius*, *Liber de Secretis Naturae*, *de Quintessentia*, and especially in *Elucidarium Testamenti*, Chap. 4: That it is not of men but of Angels to reveal this Celestial Fire, for therein is the greatest secret; and he indicates in figurative words that such Fire of the Sages is composed of horsedung and living chalk. What living chalk represents I will explain elsewhere. As to "horsedung", I have already indicated that it is the water of primary matter, for the

same is warm and moist. But it is not common horsedung, as many ignorantly imagine. Therefore the Philosopher Alanus says: "Philosophers have named the moist fire horsedung, in which moisture is retained the latent heat; and it is the property of the fire in the horse's belly not to destroy gold, but to multiply it by reason of its moisture". Alchidonius says: "Verily our medicine is to be hidden in horsedung, which is the Sages' Fire". And Alanus: "Dear son, be diligent in disintegrating, and the same must take place in gentle heat, that is, in tepid horsedung". So also Arnold de Villa Nova, Chap. 9 (Concerning Heat), says that "the heat of horsedung is its fire". And Alphidius: "Let it be boiled and buried in the warmth of horsedung". Alos Aristoteles: "The Earth, or body, will rejoice in no strength unless sublimated by horsedung". Hermes: "Roast and boil it in the warmth of the horse's belly". And Morienus: "If thou find not what thou seekest in horsedung, spare thyself further expense". Arnoldus: "And seek no other fire but this, for this is the Sages' Fire and Furnace. This water dissolves and calcines all metals, and fuses them white and red". Therefore say the Turba and Senior: Our water is the fire, and our water is stronger than all fire, making out of gold a pure spirit, which natural fire cannot do, although natural fire also belongs to it. For our water, penetrating the natural metal, converts it into primary water, and afterwards into an earth or powder, which burns gold more than natural fire. Hence gold more than natural fire. Hence Calid says: "It is verily a fire burning and destroying all things". But philosophers have concealed the preparation of this philosophical water or fire, i.e., Mercurial Water. Raymundus Lullius has written most plainly concerning the same: "And it will first be necessary to purify Mercury from its external moisture and earthy earthiness, but not with pernicious, destructive things, whereby its noble, fruitful, teeming nature would be destroyed". Avicenna, Arnold, Geber, Raymundus in the Codicil, and others, assert that Mercury is best purified by the sublimation of common, prepared salt. By treating the sublimate with hot water, the spirit of salt is dissolved out. Dry the sublimate, and mix with Tartaric Salt. Heat several times in a retort, when the Mercury will distill over vivified, and in this way will be somewhat freed from external moisture and impurities. This purgation, says Bernhardus, is not injurious, since the hot water and salt penetrate it not. But, my son, understand that Mercury cannot be thoroughly purified by external treatment, since it is a homogeneous, indivisible substance, "whose impurities penetrate its inmost being, and can therefore be removed by no sublimation". Hence another means must here be sought, viz., that of dissolving purified Quicksilver and loosing its natural bonds, and changing it into its primary, which is a sulphureous, spiritual water. Bacon and Raymundus Lullius both testify that unless purification and solution be effected, the menstruum will not be worth a fig.

When now Mercury is freed from its bond and resolved into its primary water, we can inwardly purify it, and, by distillation, separate the spirit from the water and earthy earthiness. Concerning which separation the philosophers have written mysteriously, and in particular have discovered the same figuratively in the distillation of wine. For in vinous distillation we see that the spirit of wine is mixed with much water and earthy impurity. But, by artificial distillation, the spirit can be separated from phlegmatic wateriness and earthy impurity, a residue remaining. From which residue, after calcinations, is extracted a white salt which --- added to the spirit, and repeatedly distilled --- produces a spirit mightily strengthened and sharpened by this salt of nitre. Verily the above is a figurative description given us by philosophers, which we should follow in the preparation of Mercurial Water. Since the same --- after disintegration

and solution, i.e., similarly to wine --- can, by sublimation, be separated from the water or phlegm, rectified, etc. And, verily, no one has written more clearly concerning the preparation of his Mercurial Water than Raymund Lullius, viz., in *Test. Noviss.*, also in *Liber Mecurorium* (Test. I), etc., etc., in which he plainly enough declares that, after putrefaction, distillation, and separation of philosophical spirits of wine, the spiritual water is again mingled into its earth, and distilled over the alembic, further explaining how the said philosophical wine, or menstruum, is sharpened and strengthened with a salt.

This Water Menstruum, or philosophical spirits of wine, therefore, dissolves its own body, or animated Mercury, into the primary matter, or water, by which it can then be indefinitely multiplied with the help of putrefaction and distillation. Arnold de Villa Nova writes concerning this water thus: "There is a crumbling substance containing a fatty mixture, from which substance the master separates Philosophers' Liquid, which is suitable for the work and exceedingly clear. Therein dwells the Fifth Essence (Quintessence) Metallically, and the same has affinity to metals, and in it is the Tincture to be brought together, as being a perfect metal, for it has within itself the nature of Quicksilver and of Sulphur".

I will here (although forbidden) quote *Rosarium Philosophorum* concerning the distillation of this menstruum, or water: "In the distillation of the spirit care must be taken, and the vessels in which thou purifiest thy spirit must be of glass, that the spirit find not a place to flow out, by reason of its quickness. For if the Red Spirit escape, the Artist labours in vain. Artists call the Red Spirit a blood, and menstruum; therefore take heed with thy vessels that thou collect the dry spirit with its blood by itself in a receptacle, without diminution of its strength, so that thou mayst store up the same for future use". But, in distillation, seeing is more than writing. Hence nobody should be a master before having been a disciple. Therefore be careful in the work. Place a receptacle beneath, and distil first --- with gentle heat --- the element of water. Set the same aside, substituting another receptacle; close well the joints, that the spirit escape not, and increase the fire a little. Then will rise in the helmet, and distill over, a dry, yellow spirit; keep the fire steady while the helmet is yellow. Afterwards, when the helmet begins to get red, increase the fire slowly, and deep it so until the Red Spirit and the Blood have quite distilled out, passing through the helmet like clouds in the air. When the Red Spirit has distilled over, the helmet will become white. Then cease quickly, and thou hast in the receptacle the two elements, Air and Fire, and thus hast extracted the right dry spirit, and hast separated the pure from the impure. Behold, thou hast now the primary matter of metals, having thus separated the pure from the impure! Behold, thou hast now the water in which all metals have their origin, which is of all metals the root! Hence are they dissolved into water, even as frozen ice is resolved into water, since the same clearly was water in the first place. Therefore marvel not at this, for all things upon earth have their root in water. Oh, how many are there that, working, never think of this root, which is the key of the whole work? The same immediately dissolves bodies, is father and mother, opens out and locks up, and reduces bodies to their primary matter. It dissolves bodies, coagulating itself with them, and the Spirit of the Lord is led forth upon the Water, i.e., the strength of the spirit is seen to be active therein, and this takes place when the body is placed in this water. And the philosopher adds: "Behold the base thing with which our Sanctuary has been opened! For it is a thing well known by everyone; ye, he who understands it not finds it seldom or never. The wise man keeps it, the fool

throws it away, and its reduction is easy to the initiated". But, my son, the freeing of this Stone, or Mercury, from its natural bonds, and its resolution into primary water, is the greatest and most secret of mysteries. And, without it, all else were vain, for we could not separate or extract the right spirit or Watery Essence that dissolves bodies. And this dissolving has been kept secret by all philosophers, and they have paced the revealing of the same in God's hand, and have cursed the man who should punish it. Hence they have spoken briefly and with subtlety of this resolution, that the same might remain hidden from the ignorant. But, thou, my son, observe that such resolution of Animated Mercury can hardly be effected without the proper means (coagulation). But, observe further, that here are not to be used sophisticated means, like those used by ignorant fools who, reducing common Mercury to water by sophisticated contrivances, vainly imagine they possess the true water. They sublime Mercury with all manner of corrosive salts and vitriols (whereby the sublimate generates Spirits of Salt), and, afterwards, dissolve the sublimate into water in a bath, cellar, and otherwise. They also make it into a water by means of Salmiac, herbs, soaps, aquafortis, with strange vessels, and such like sophisticated methods, which are, altogether, great phantasy, foolishness, and vanity; and then they imagine they can again separate such things from Mercurial Water, and thus obtain the true water desired of philosophers. But all is false, and they find not what they seek. And the cause of their failure is their neglect of the teaching of philosophers, who plainly declare that it should be mixed with no foreign matter. Bernhardus says in his Epistle: When Mercury is dried by Salt, Aquafortis, or other thing, it is no more suitable for philosophical work; for, dried by Salts, Alums, and Aquafortis, it dissolves not any more. But, thou, my son, remember what I now tell thee, and what philosophers have, in their books. Revealed to the understanding, that this water is to be prepared with no foreign matter in the world, but alone by Nature, with Nature, and out of Nature. These are to the understanding plain, clear words, which I will not in this place explain more at length, but will embody them in a Treatise. Yet as an aid to memory give you the following verses:

Take it fresh, pure, living white and clear,  
Then bind firmly both hands and feet  
With the very strongest cords,  
That it suffocate and die.  
In the closed House of Putrefaction,  
According to nature's example,  
Let the same Nature dissolve it  
Into the same Nature dissolve it  
Into pure and beautiful primary matter.  
Then shall it be a living, spiritual Fount,  
Flowing from heaven pure and clear;  
Eating its own flesh and blood,  
Whereby it is multiplied.

He who, by Divine Aid, has attained this Blessed Water, let him praise God; for he holds in his hands the key with which he can unlock the treasure houses containing gold, silver, precious stones, honour, power, and health. This Blessed Water is by philosophers called Pluto's Daughter, having power over all treasures. She is also called the white, pure, tender, undefiled Virgin Bega, without whom no bringing forth nor mingling can take place. Therefore have philosophers married this pure, tender

Virgin to Gabricus, that she might bear fruit; and Gabricus, having known her, died. Bega, by reason of her great love, swallowed and devoured her great love, swallowed and devoured him, as Aristotelese cleverly shews in Turba Philosophurum; and Bernhardus in his Practica says: “The fount is to the king as a mother, whom she bears within herself, and kills him. But the king rises again, and becomes so strong that no man can wound him”. Hence philosophers say: “Although the king is, before the world, more precious and worthy than Bega, yet alone can he bear no fruit”. This Virgin and Blessed Water have philosophers in their books called by a thousand names, as a Heaven, Celestial Water, Heavenly Rain, Heavenly or May Dew, Water of Paradise, Aqua Regia, Corrosive Aqua Fortis, a sharp vinegar and brandy, a Quintessence of Wine, a waxy green juice, a waxy Mercury, a water becoming green, and Green Lion, a Quicksilver, a Menstruum, a Blood and Mesntruum, urine and horse-urine, Milk, and Virgin’s Milk, white *Arsenic*, Silver, a moon and a humour of the moon, a woman and woman’s seed, a sulphureous, steamy water and smoke, a fiery burning spirit, a mortal penetrating poison, a basilisk which kills everything, an envenomed worm, a poisonous snake, a dragon, a poisonous serpent which devours its offspring, a strong fire, and a clear fire, a fire of horse dung and horse dung, a sharp salt and sal armoniac, a saltary and common salt, a sharp soap, lye, and viscous oil, an ostrich-stomach which devours and digests an eagle, a vulture and hermetic bird, a seal and vessel of Hermes, a smelting and calcining stove. Innumerable other names of beasts, birds, vegetables, waters, humours, of milk, of blood, and of men have been given to it. Philosophers have spoken of it in their books, moreover, in a figurative manner, that such a water should be made out of such things, and all the fools who have sought it in such things, have never found the desired water.

But, know this, my dearest son, that it is only made out of live Mercury, and from no other foreign thing in the world. The philosophers have given it these many names in order hat the unwise may never know it. And you, my son, will have concluded the first part of this treatise, when you understand and know, that without this fire all the toil of the whole world and of alchemy is mere loss, and all alchemical processes are a delusion, unprofitable and false. For the Great Rosary says: “The receipt consists of only one thing, and with this key all the books of the philosophers are particularly and universally closed, and surrounded and guarded as with a strong wall. He who has not yet acquired the key can never enter the fortified castle, or obtain anything profitable. For this water is the one only key for opening the metallic walls. Further, this water is the strong aquafortis which Isaac refers to in his fragmentary work, and wherewith he dissolved bodies and made them spiritual. Therefore, diligently note, all alchemical work without this is only lies and falsify, whether metallic, mineral, vegetable, or animal substances are used. It is dissolved, sublimated, distilled, calcinated, extracted, mixed, compounded, as one will. One may dissolve it in cellars, in the bath, in dung, in aquafortis, and in all manner of strong waters, in every possible way, as the alchemical processes direct. We may make oil, water, lime, powder, black, white, yellow, and red. We may burn it, we may melt it in any possible fashion, even as the alchemical receipts tell us, and call it the true means for making gold and silver, yet from beginning to end it is abomination and falsity. I myself, with my own hands (for once I disbelieved this), have experienced such loss and damage.

Therefore, my son, be fully warned against the sophistry of Alchemy and all sophisticating, deceitful people. Beware of them as you would beware of the devil who works mischief. Avoid them as an impure, pitiless, and consuming fire, even as a

deadly poison, for a man comes to destruction of both body and soul, honour, goods, through this sophistry and self-insinuating false Alchemy. It is worse than the devil himself, for it is possible to expend (the wealth of) a whole kingdom thereon; yet everything is destroyed, and no fundamental truth is found out. Accordingly, open your eyes. Recognize the only key; avoid falsity, for it is impossible in any other way to obtain anything true or profitable, save in that way which I have now shewn in this book.

---

## A Short Admonition to the Reader

I do not personally know who the exceedingly propitious and beloved reader of the remarkable foregoing treatise may be, but I communicate what I have obtained to you, and would fain that the other portion of the small book were also forthcoming, and entirely printed. You will not, however, think that I withhold it from jealousy, as is the common case with others in their editions of such philosophical tracts. But because I have communicated to you the mercurial water and permanent water, wherein chiefly consists the key of this Art, and this has been done in a useful and faithful manner, I will give the further processes requisite in my other volume --- *Thesaurinella Aurea Olympica Tripartita*, which will come out next Easter, and will contain a collection of the writing of the Philosophers, printed for the first time, concerning the Blessed Stone of the Wise, so that you will have sufficient and useful instruction to your heart's desire, and will know how to thank me for it. When I get the other part I will not keep it from you. I have always wished and prayed to be the means of your instruction.

Farewell, with the love of God, which passes understanding!

---

**Certain Verses of an unknown Writer,  
Concerning the Great Work of the Tincture.**

Wilt thou, by God's grace alone.  
Obtain the Stone of the Philosophers?  
If so, seek it no in vegetables or animals,  
In sulphur, quicksilver, and minerals;  
Vitriol, alum, and salt are of no value;  
Lea, tin, iron, and copper profit nothing;  
Silver and gold have no efficacy.  
Hyle or Chaos will accomplish it all.  
It is enclosed in our salt spring,  
In the tree of the Moon and of the Sun.  
I call it the Flower of Honey,  
The Flower known to the Wise.  
In fine, the Flower and Honey  
Are the Sulphur and Quicksilve of the Wise,  
Even water and earth,  
With the whitish seed of all metals.  
The water is volatile, the earth fixed;  
One can effect nothing without the other,  
Both are born of a root having a white exterior.  
It produces all the virtues of the metals,  
Yet it is not dug from the ore  
Either with pickaxes or other instruments.  
In the place and spot where our Matter is found  
No other metal whatever exists.  
It is produced, with its virtue and efficacy,  
In Hyle or Chaos alone.  
Homer knew it well, and called it Moly.  
This, in its proper condition,  
Has a root altogether black.  
The god Mercury offered it to Ulysees,  
Even unto Ulysses in his wanderings,  
As a precaution against the sorcery of Circe.  
The gods also have bestowed it upon man  
As a singularly great gift,  
Designed to assuage and comfort him.  
Hence springs pleasing nectar,  
The drink of the goddesses.  
It is also termed Chelidonia,  
As a singular gift of Heaven.  
Solar Root is another name.  
The root is known to the wise:  
It receives high honours in astronomy,  
Is metaphorically likened to the planets,  
Lead, tin, copper, and iron,  
Silver and gold, everything the wise have named.  
In the tongue of Chaldea it is also called Azoth;

In German it is a blessed spirit;  
In Latin, argent vive animate,  
That is to say, Mercury of the Philosophers.  
It is also named the herb Adrop,  
A well-known Chaldean word,  
Signifying in our speech Saturn.  
Astronomically speaking, I must say  
That Saturn rules the earth.  
Metaphorically is our matter compared,  
Being the Red Lead and Red Earth,  
With Fools despised and valueless.  
It is called the Red and Green Lion.  
It is well known as the Adamic Earth ---  
A skillful production of the Wise Creator,  
Which doth contain and unite in one mass  
The powers of all natures.  
From this mass and red earth,  
Almighty God creates Adam.  
He has highly honoured our first father,  
Who is also called Microcosmus.  
You are to recognize the Red Earth as Adam;  
We call it the First Matter.  
Later on, I will likewise disclose its preparation.  
With great courage kill the lion;  
But take its coagulated blood,  
The brilliancy of gold and its costliness,  
Separated from the center of putrefying earth;  
Dissolve it with the greatest diligence;  
Imitate the Creator of Nature so wise,  
Who will vouchsafe to enlighten our understanding,  
That we may separate the dry from the moist.  
Thus water is produced from earth,  
The volatile from the fixed,  
The animated spirit on the earth.  
Water and earth, two invisible elements,  
Have, by God's grace and care,  
Fire and air concealed within them.  
They are also purely impregnated  
With the fifth invisible nature.  
But, to proceed to the end of the work,  
Marry the woman with the man,  
Our Adam with clear Eve,  
Both being absolutely naked,  
For then Nature herself, being clean and pure,  
Rejoices with her own nature.

The animated spirit dissolves the body,  
The body coagulates the spirit.

This is the sole Mercury,  
Which is the Foundation of the Stone of the Wise.  
It becomes black, white, green, and red,  
Is itself Proteus, the God of the sea,  
Who, being caught, so wondrously  
Transforms himself into a thousand shapes;  
That is, it dissolves and coagulates itself,  
Sublimates and calcines,  
Mortifies and vivifies,  
Washes and incerates,  
Clarifies and fixes.  
In all these things  
Heaven and earth are concerned,  
And the Sun and the Moon  
Become dark and black as a raven:  
Heaven and earth are melted quite away:  
Truly, in the Hyle or Chaos  
There is a most wonderful strife  
Of the elements in all directions.  
Water covers all the earth,  
But, in order that the moist may become dry,  
Our strong giants maintain  
Incessant and unwearying contests  
With our wondrously small dwarf,  
Who, finally, by divine miracle,  
Conquers and overcomes  
And captures them all, both slays and binds.  
Out of the destroyed rubbish  
God creates a new Heaven and Earth.  
The New Jerusalem is built  
With transparent clear gold,  
Also with pure precious stone.  
Here is placed the famed Stone of the Wise,  
The Unique bird, the good Phoenix,  
Who by the glow of the fire  
Is slain and born again,  
And becomes a real Salamander,  
Who now lives in the fire.  
This is the filius solis, child of the sun,  
Who with his singular power  
Works miracles and great wonders,  
And can expel all sicknesses  
In human and metallic bodies,  
With glorified body, flesh and blood,  
He purifies all that is corporeal.  
The immortal Adam, highly endowed,  
Tinges common gold and silver,  
So that they thereby may become fruitful,  
To bear their blessed likeness on the Earth.

---

## Enigmas Concerning the Tincture

### *Question the First.*

All things are compounded in triads;  
They also rejoice in thenuber four,  
Yet they resolve themselves into unity,  
For otherwise nothing could exist.  
It is indeed a subtle vapour,  
And proceeds from Divine favour.  
Tell me, then, what is this art?

### *First Answer.*

A point which suddenly goes in a circle,  
Wherein quadrant and triangle sand:  
If you obtain it, you have the secret,  
And escape poverty, want, and peril.

### *Question the Second.*

I am sprung from four.  
Your war harasses and slays me,  
Could I but end this war,  
Then my soul would never depart from me.  
Your war destroys the green grass.  
Alas for advice! What good does that?

### *Second Answer.*

If you desire to unite the evil four,  
That they may no depart from one another  
Under the test of fire, then make them fire.  
Thus you will possess a treasure richer far  
Than Charles of Ghent could count,  
Although he were a rich man.

### *Question the Third.*

At first, there were four,  
Yet now are there only three.  
Before, there were five,  
Yet release the fourth;  
Otherwise we cannot use them.  
Instruct me, what kind of being is this?

### *Third Answer.*

One and four compose five completely,  
But three and one make a bad four.  
If you wish to reduce the three to unity,  
And cannot, then make it nothing.

*Question the Fourth.*

Who is it, whose war is readily  
But with secrecy prepared?  
Yet there cannot be war without warriors:  
I need four of them for this strife.  
Instruct me, now, where are there such people?

*Fourth Answer.*

From the green meadows  
Come forth our giants;  
From the deep mines  
Proceed our dwarfs.  
Vesuvius and Etna furnish us  
With the children of the fire.  
The deep waters produce our nymphs;  
Our water is not disagreeable.  
Instruct us what is this?

*Final and Universal Rule.*

On the Mount of Venus, on the green heath,  
You will find your answer.  
Seven companions go in and out,  
Drinking with gusto a sour wine,  
Ogling also a beautiful woman,  
Whom they regard with looks of live.  
This love befools their bodies,  
So eagerly desire they the woman.  
These men will expound thy questions,  
And quickly answer the same.  
Now cease thy questions,  
For more I may no tell thee.

---

## **A Short Admonition to the True-Hearted Reader and Son of the Doctrine.**

Well-beloved Friend, Brother, and Reader, since this book is coming to an end, I have obtained the following description of the potable gold from my dear and most trusted friend, John George Cressius, citizen of Heidelberg, and lover of chemistry. He wishes me to append to it the statement that it is the work of Theophrastus. I cannot say for certain that it belongs to our dear Teacher, since many processes and writing appear among the lovers of Alchemy bearing his names, but such as he would never have thought of writing in such a fashion. However this may be, may I prove not unpleasing to thee that I place after it a remarkable instructive tract of Dom. Jacob Montanus, Doctor at Konigsburg, Prussia. The treatise deals with the efficacious administration of the glorious antidote called potable gold, the highly desirable, universal medicine for all diseases. Take this Pandora for the present, and be welcome to it. As to what may be wanting in it, I will send thee it in our Olympic Golden treasure, to be printed at Frankfort, as also in our New Olympic Rosary, which, as an appendix to the Golden Fleece, is to appear a Basle, if God will, this Easter. If I find that this work which I dedicate to thee is acceptable, thou wilt see next Michaelmas, and the following Easter, four or five additional tracts, by ancient and modern writers, concerning the Philosopher's Stone, if it be God's will, if it please thyself, and the publisher sufficiently remunerates me. Vale.

---

## Concerning the Potable Gold of Theophrastus Paracelsus

Take an old Hungarian wine which has not been drawn off, but still remains on its stand, and is already clear, the older the better, and extract its spirit. At first there goes up a little phlegm, and shews itself with streaks. When the rectified spirits ascend, no streaks are to be seen, and when these recommence, and the evaporation leaves off, distill the spirit again, and leave a little behind; this is now phlegm. Repeat the process ix or seven times, in each case leaving a little behind, until the spirits be quite separated from their phlegm.

### Test for the Spirits ~

Take a small and fine linen cloth, moisten it with any spirit, set fire to the cloth, and when it is completely consumed, the spirit of wine is rectified. Next, drop in a drop of olive oil, as the spirit falls from the stand to the bottom, and remains on the bottom, as fast as one stirs up; then you will have completely and rightly distilled the spirit of wine.

After this, take the extracted phlegm and distil it very slowly; at first a little spirit will evaporate; you may keep the same to drink; continue to distill the phlegm slowly, and there will remain at the bottom a beautiful white earth. Keep this, as also the phlegm; next, distill the remaining phlegm about tow measures; keep the phlegm, for it will serve you for the first phlegm. Afterwards, completely distill the matter; a black substance will remain at the bottom, smelling as offensively as pitch, while the black matter is still moist, In order to pour it out, pour it into a retort and distill it very slowly, when phlegm will at first arise; throw this away, and when the oil begins to dissipate, put it into another receptacle; distill the oil slowly, and carefully preserve it. After this, destroy the retort; take out the black matter; break it into pieces as large as beans; let a potter construct you a vessel shaped a Wallenburgian box, with a lid; put the black earth therein; elutriate the box well, and let it dry. Place it in a fire, at first gentle, afterwards strong, for his purpose covered with coals. Let it remain in this condition 12 hours; then let the fire cool so that the matter may become cold.

Afterwards, put it on again, and calcine it as at first. Then the matter will become beautifully white like paper; pound it small; pour upon it some of the phlegm which I gave instructions should be kept hot; let it stand 24 hours, when a salt will be extracted from the earth; pour it away from its dregs, and again pour another phlegm upon it; then let it stand 24 hours while more salt is being extracted. Repeat the process till the extraction ceases. Then throw away the remaining earth, which looks like sand. After this, extract the phlegm, and a beautiful white salt will remain. Repeat the process six or seven times, so that it retains the moisture; otherwise it will not receive the spirit of wine.

Now, pour upon the salt a little spirit of wine; shake it well; pour it into a phial in such a way that the spirit of wine may pass over it to the breadth of two or three little fingers. Then let it stand two months putrefying and the spirit of wine will acquire a beauteous red colour, and become even as an oil. After this, take as much gold from the goldbeater as you wish, put it in a phial, pour the spirit of life upon it, wherein its salt is dissolved; let it stand for about three months in a moderate heat, and the red

will turn into a beautiful yellow, and will extract the soul of the sun into itself. Pour this away. Distill it by means of the alembic, and the spirit of the sun will arise with the spirit of water, and will be potable medicine. Its salt will remain behind, which you may keep.

---

## **On the Power, Operation, and Exceedingly Beneficial Use of the Glorious Antidote Termed Potable Gold.**

The worthies of antiquity, before as after Christ, have, with the greatest diligence, laboured in most searching enquiry and investigation into the nature of and concerning the property and potent efficacy which reside deeply hidden in gold, which also innumerable writings on the subject serve to demonstrate.

Now, it is not without reason that their zeal has caused them to labour and toil so wearily, because they have seen that the greatest constant of all God's earthly creations lies hidden in gold, which by no element can be destroyed or broken without extraordinary skill. All other creatures, as silver, precious stones, pearls, corals, spices, vegetables, and all kinds of herbs, howsoever named, although Divinely endowed every one with great power and virtue, cannot, notwithstanding, resist fire and the other elements, but yield and are destroyed.

In consequence, our ancient worthy men have made a commencement, and sought in many ways, and at great cost, wherewith, and by what means, the said noble creature of God might be compelled to yield its infinite power and virtue to succour human health, and become indisputable theirs. Many industrious investigators have diligently asked God for understanding, so as to arrive at the end they desire. Many, however, and the majority, have thought to force the sun by disgusting things, corrosive salt, urine, Mercury, and the like, but have accomplished nought, since, using, as aforesaid, noxious medicines, which cannot be employed without harm and damage.

Thus, these unskillful workers, ignorant of the nature and property of this gold, can accomplish nothing, either by fire or any other way, and in consequence imagine that it is impossible to force the gold without the corrosives, and to reduce it to a potable gold.

Yet is it manifest that God Almighty has created all creatures in the water and on earth solely for the use of man, and has appointed man as the ruler of them all. Hence it follows that there exists nothing so trifling and mean, but, applied externally or internally, it may be put to a medicinal use.

However, the noble metal and medicine is never, as many suppose, to be sought in acids; still less from other species of metals can it be extracted, even with the aid of fire, for it resists all this, but must be compelled by a special subtlety, and be changed from its first form and metallic nature. Afterwards its power and virtue are extracted by means of a pure, specially prepared spirit of wine, in the same way as noxious herbs, without the use of any corrosive whatever. The potable gold prepared with corrosives cannot be used without great harm and damage.

As to how, and in what manner, the sages thought that gold could be compelled to yield its power and virtue, a thing most people deem impossible, I ought to reveal to every considerate man, though, notwithstanding, little thanks will be gained, even when I have appealed to the uprightness of my life, and though the expenses I have incurred should be considered. I have no hesitation whatsoever to point it out, and

thereby openly dissipate all suspicion. Consequently, I have, as soon as possible, made a short relation concerning the preparation, whereby anyone may know for whom this, my already prepared Potable Gold, may be used, in that it is prepared without any corrosive matter, and can be used with no risk whatever as a universal medicine in all serious maladies.

Know, in the first place, that before the medicine can be properly used in long-standing sicknesses and weaknesses, it is necessary that the body be purified by proper medicines, as a learned and skillful physician directs. For with regard to sudden dangerous sickness, as apoplexy, epilepsy, cordialgia, syncope, tremor cordis, and the like, it is permissible to use the tincture at once; yet in the case of such severe dangerous illnesses, when the attack itself is allayed, it is well, before further employment of this tincture of gold, that the body be none the less previously purified.

In the next place, we must be careful concerning the amount of the dose, to avoid administering too much or too little; it is beneficial to give a full-grown adult guttae, or small drops. A person half-grown takes five or six; a child but one drop. The distilled water or wine that accompanies the dose must not exceed a single spoonful.

In the third place, in the case of chronic sicknesses, it should be daily, early in the morning and about five or six at night, after four or five hours fasting. When necessity requires, and the sickness has obtained a firm hold, it may be used thrice a day, that is to say, in the morning, between the two meals, two hours before dinner, and in the evening, two hours after supper. If the patient wishes to sleep, no further meal must be taken for two hours. This daily use must be kept up 8 or 14 days, according to the nature of the disease.

In the fourth place, it is necessary that potable gold be taken with things appropriate to it. We must regard the qualities, effects, and position of the same; for this reason, various accompaniments are suitable. It must be used to allay pain of a headache with water of betony. In case of giddiness, balm is necessary. Insomnia requires aqua vitae, betony, or marjoram water. Apoplexy requires water with extract of lavender; also place separately two or three drops at first on the tongue. The same quantity is used for paralysis. For a bad memory use a decoction of the roots of fennel and acorns.

Melancholy, sadness, and similar emotions of the mind, which are especially seated in the head, require betony and peony water, together with the potable gold, or liquor of oak mistletoe, but never anything hot, for this fills and oppresses the head. Should the malady arise from feverish blood, use water of common fumitory. Borage water dissipates and wards off all weakness and feebleness of the head, and preserves the constitution.

In epilepsy, or falling sickness, the potable gold must be used with peony water, or with a decoction of the root of peony, or with a decoction of the root of peony, collected while the moon wanes; in the case of an old or full-grown man, at the beginning of the paroxysm. The same is required when the paroxysm has ceased. A child of a year or 18 months, and of corresponding size, must be given one drop. A very young child must, at the commencement, middle and end of the attack, only have the point of its tongue smeared by means of a piece of wood dipped in olive oil.

Continue the application till the epilepsy ceases altogether. In cases of ophthalmia, or abscess in the eye, use fennel, swallow-wort, or xerophthalmia water. For catarrh and rheum add violet root water. For toothache drop a little into the tooth. For bleeding of the nose, scabious or plantain water must be used. For phthisis or constipation use honey water or milk. For ulcer of the lungs, take water wherein crabs have been caught, well corrected, for offensive breath, orthopnoea, and other cold and rheumy diseases, use water of Marrubius, hyssop, fennel, and the like. In cases of trembling or palpitating of the heart, use balm or borage water. With pains of the stomach use balm mint water, or a decoction of balm mint.

In fainting or heaviness place one or two drops on the tongue, with borage or sorrel water. For the iliac passion, or twisting of the guts, use plantain water. For the worm use a decoction of zedoary. In costiveness, pain or swelling of the liver, or dropsy, where external heat is the cause, use plantain or liverwort water. When the illness is occasioned by cold, use a decoction of spikenard and of cinnamon, for it removes the obstruction. In costiveness of the spleen use ash-tree water. In melancholy the potable gold must be administered with temperate, not with cold or hot, things, but with fumitory water, young hops, or nettle-moth water, or with liquor cornucervus, also with rose sugar, syrup of betony, after a slight purgation of the melancholy and morbid humour has been effected by the syrup of epithimum and cichorium, which humour produces the obstruction. Otherwise, the virtues of this potable gold would be extinguished and frustrated. This must also be understood of other medicinal extracts. For pain in the stones and the kidneys, use aquatic nut water, radish water, pimpernel water, or philanthropist's powder. In case of strangury or injury to the reins, employ fresh goat's milk. With rupture use a species of woundwort or common comfrey water. In obstruction or retention of the menstrual course, taking place not only in the matrix but in all other parts of the body whence the matrix receives its nourishment, the channels which convey nourishment are choked up. Since there is no nutriment in the uterus, there is also no menstrual excrement, and alarming symptoms supervene. The potable gold, however, is most excellent in removing this evil, wine mixed with herbs being employed for a week, twice or thrice daily, early in the morning, and at night, about four or five drops being used at a time. It is a marvelous secret in the case of any menstrual flow, ensuring proper regularity. Women take it, as Theophrastus and others witness, even when 50 or 60. Moreover, because the potable gold sets right the flow of the white and red, not restraining it like the ordinary astringents, but separating the bad from the good, it assists Nature to expel the bad, retaining what is good for the nourishment of the uterus; it is utilized in suffocation of the uterus, as the case requires, with wormwood water, orange peel water, endive, wormwood, salt, etc. The potable gold is also used with wormwood in cases of difficult birth. For sterility, water of Neptune or lavender is required. In cases of gout of the foot or the hand, burning water, or water of paralysis, or lavender water, is necessary.

When there is plague, it is good, if the malady and falling sickness permit, previously to administer a lenitive of cassia, manna, and the like, according as one ascertains from the symptoms what humour has infected the body and rules it, afterwards employing the potable gold with other purgatives. In cases of putrid fever, arising from humours, as takes place in a mild pestilence, antiseptics must be taken. When the putrefaction abounds in humours, then the appropriate lenitives must be used, but nothing acid. These humours must be dealt with in this manner since they would hinder the operation of potable gold. Various accidents originate them. We have here

given the best instruction how the poison may be warded off, either by perspiration or vomit. Therefore this potable gold is in this case used with lemon water, liquor of *Carduus Benedictus*, sandalwood, sag's head, syrup from the acidity of lemons, with water of citron, conserve of roses, of borage, water germander, in cases of heated paroxysms and with a warm condition of the body, etc. But if the heat were moderate, and the poison were situated in cold humour, it would be properly administered with theriacal water of pimpernel, vervain, angelica, and pomegranate. Moreover, pearls, corals, and salt of absinth may be added.

In the case of gangrene, fistula, itches, the potable gold with aqua pedis Columbini and sorrel water, externally and internally used, has healing efficacy. As for poison, it preserves those who are poisoned or been by a mad dog. It cures them with white tormentil or snake's root water.

The gold must be administered in the case of quatrains and other fevers with water of *Cypripedium*, theriacal water, water of *Carduus Benedictus*, or a sufficient decoction of the root of fennel, pimpernel, and salt of absinth. It is generally given at the commencement of the paroxysm, Perspiration must, if possible, follow.

In certain complaints of the belly we require water of the dodder of thyme, fumitory water, with liquor in water *Garyophyllorum Maris*, with a decoction of *Vincetoxicum* and of *Camaedius*, with a syrup of the acidity or the juice of lemons. Finally, it may be used against all maladies which are formally named by physicians. Yet we must be careful that, together with these sicknesses, we take into consideration the other indispositions or diseases which humours originate, as when, for instance, heat and cold are present, that we may know the opportunity for using a suitable preparation. Thus the potable gold is powerfully conducive to preservation and cure in the case of miners, assayers, alchemists, goldsmiths, cannon founders, mint-wardens, and all those who have been poisoned with poisonous smoke, and especially with mercury sublimate, crude and precipitate, or however it may be termed.

It is especially efficacious with those whose constitutions have been ruined by grease and fumes from the precipitate, and such matters. In this case the gold is accompanied with treacle water, scabious water, water of pimpernel, anthos with the sap of the holy wood, horn of sag, rhubarb, Muscat nuts, conserva anthos, syrup from the juice of lemons, bark of citron, of Mithridates, etc. We must also add, if necessary, the redness of pomegranate, and the pearl salt of absinth.

Finally, this potable gold destroys all superfluous moisture in the body; when rightly used, externally and internally, it expels all impurities, is an excellent purgative of every poison, purifies the blood, not by evacuation, but passing imperceptibly through all the limbs, renews them, retains that which is good, expelling the bad, being the true tincture of the wise, for consuming the remains of diseases, and increasing the natural heat of the body, surpassing herein all other medicaments. It is also efficaciously employed for fistulas, gangrenes, and all incurable ulcers, externally applied. This potable gold is also used with wine for leprosy. So much for the present concerning the right use of this glorious antidote. Should further information on this subject be desired, it can be obtained by consulting me at my house.

Jacob Montanus  
Doctor of Medicine at Konigsburg, in Prussia, in the year of our Lord, 1595.

*Finis.*

## **A Letter to the True Disciples of Hermes, wherein are Six Cardinal Keys of the Secret Philosophy**

Were I writing this letter to persuade of the truth of our Philosophy those, who unto themselves imagine it but a vain idea, & pure Paradox, then should I follow the example of the divers of the masters of this art; & I should attempt, basing myself upon the laws, & in the operations of nature, to convince such spirits of their error in demonstrating unto them the solidity of the principles of our science, & should touch but lightly upon such as concerns its practice: but in that my design be wholly other, & that I write but for yourselves, wise Disciples of Hermes, & true Children of the art, my sole aim is to serve you as guide upon this course so difficult to follow. Indeed our practice is a pathway in the sand, whereon must we take the Pole Stare for guide, rather than trust to the vestiges we find imprinted on it. The confusion of trails left on it by a near innumerable host, are so numerous, & one finds there such profusion of divers tracks, leading nearly all unto but some awesome desert, that it is well nigh impossible not to err from the veritable way, that alone those sages favoured by Heaven, have happily been able to extricate, & to recognise.

Such confusion brings to an abrupt halt the child of the art, one at the very start, another in midstream of the Philosophic course, & some few as they approach even to the ending of this arduous route, & descry the first glimmerings of the felicitous term of their enterprise; but perceive not, that the little road, left them for to travel, is the most laborious of all. They know not that those envious of their joy have hollowed ditches, & precipices in the midst of the path, & that unless it be they know the secret byways, whereby the wise sidestep such dangerous pitfalls, they shall miserably lose all advantage gained, at the instant itself, of imagining they had overthrown all obstacle.

I sincerely avow, that the practice of this our art is the thing most difficult in all the world, not as regards its operations, but with regard to the hardships there be, to learn it plainly from the works of the Philosophers: for if on the one hand it is with reason called, child's play; it requires upon the other in those who in it by their labour & study seek the truth, a knowledge most profound of the Principles, & operations of nature throughout the three realms; but the more especially in the realm of the minerals & of metals. 'Tis a grand point to discover the true material, which is the subject of our work; & one must needs to that end pierce the thousand dark veils, wherewith it is enwrapped; one needs must distinguish it by its own proper name, among a million extraordinary names, wherewith the Philosophers have diversely declared it; comprehend its properties in their entirety, & judge all degrees of perfection, art might bestow upon it; know the secret fire of the wise which is the one & sole agent efficient unto the opening, subliming, purifying, & disposing of the material to reduction into water; to which end must one penetrate also unto the divine source of the heavenly water, which operates such solution, animation, & purification of the stone; one must needs by means of a complete solution of the body, whence it springs, be able to convert our metallic water into an oil incombustible & to this end know how to effect the conversion of the elements, & separation, & reunion of the three principles; one must needs learn to make a white Mercury, & a Mercury that is citrine; one needs must know how is such a Mercury fixed, & nourished of its own blood, that it might convert into the fixed sulphur of the Philosopher, that one be not

in want of an explication more ample.

As there are in nature three realms, there are also in our art three medicines, which are three different workings in the practice, & which are nonetheless but three different degrees raising our elixir to its final perfection. These crucial operations constituting the three workings are by all Philosophers hid beneath the Key of secrecy, that the sacred mysteries of our divine Philosophy be not disclosed unto the profane; but to you, who are the children of science, & who are capable of understanding the language of the Sages, shall the locks be unloosed, & you shall have the Keys of the precious treasures of nature, & of art, if that you shall apply your mind entire & wholly to the comprehension of that which I wish for you here to set forth, in terms so easily intelligible, the which is of necessity, for the benefit of such as yourselves who are predestined, to knowledge of these sublime mysteries. I shall place within your hands six Keys with which to enter unto the sanctuary of Philosophy, open all its secret cabinets, & come to intelligence of verities most hidden.

### KEY THE FIRST

The first Key is that which lays open the dark prisons, wherein lies captive sulphur; 'tis that which knows how from the body to draw forth semen & which by conjunction of the male, with the female, spirit with body, sulphur with Mercury, forms the Philosophers' Stone. Hermes has made manifest the operation of this first Key in these words. *De cavernis metallorum occultus est, qui Lapis est venerabilis, colore splendidus, mens sublimis, & mare patens [1]*; this stone shines brilliant, contains within it a spirit of sublime origin, & is the Sea of the Wise, wherein they do seek their mysterious fish. The same Philosopher further & more particularly marks the birth of this admirable stone in the words: *Rex ab igne veniet, ac conjugio gaudabit, & occulta patebunt.*[2] A King he is & crowned in glory, taking birth within the fire, & who rejoices in union with the wife that to him is given, & it is this union that lays manifest what theretofore was hid.

Howsobeit, before that I pass on to other subjects, I have a counsel I would give you, the which shall be unto you of no little profit; & that is to point out that the operation of the three workings, having much that is analogous, & many relations the one to the other, the Philosophers wilfully speak concerning them in terms obscure, that those who have not the eyes of a lynx, shall be duped, & lose themselves in this labyrinth, whence it is right difficult to extricate oneself. Indeed as one imagines they are treating of one operation, they are often times speaking of another: take care then lest you be taken in: for it is true, that in each working the wise Artist must needs dissolve the body with the spirit, strike off the crow's head, whiten the black & redden the white; yet is it properly in the first operation, that the wise Artist shall strike off the head of the black dragon, & of the crow. It is thence that art, says Hermes, takes its beginning, *quod ex corvo nascitur, hujus artis est principium.*[3] Consider then that it is by separation of the fumes, black, foul, & malodorous of a black most swarthy, that our astral stone takes form, white, & splendidly radiant, the which in its veins contains the blood of the pelican; it is on this first purification of the stone, & at this lucent whiteness, that the initial Key of the first working comes to its close.

### KEY THE SECOND

The second Key dissolves the composite or stone, & initiates the separation of the Elements, in Philosophic manner; such separation of the Elements is achieved solely

in the raising of those parts that are subtle, & pure, above those that are crass & earthy. He who is competent to sublime the stone in manner Philosophic, justly merits the title Philosopher, for he knows the fire of the Wise, the which is the unique & sole instrument, capable of operating such sublimation. Never has Philosopher overtly revealed this secret fire, & puissant agent, which performs all the marvels of the art; he that understands not, nor has distinguished it in the characters wherewith I painted it forth in the discourse of Eudoxus & Pyrophilus, should halt here, & unto God make prayer that he illumine him: for knowledge of this great secret is rather a gift of the Heavens, than light acquired by force of reasoning; let him read nonetheless the writings of the Philosophers, meditate thereon, & most especially pray; for no difficulty is there, that shall not be illumined by work, meditation, & prayer. But that the stone be sublimed, the conversion of the Elements, & extraction of principles, shall prove impossible; & this conversion, which makes of the earth water, of water air, & of air fire, is the sole & one means whereby may be made, & prepared, our Mercury. Apply yourself therefore that you know this secret fire, the which does naturally dissolve the stone, & without violence, & resolves it into water in the great sea of the Wise, by distillation worked by the rays of the sun & the moon. Thus it is that the stone, which according to Hermes, is the vine of the Sages, becomes their wine, whence by the operations of art is produced their rectified *aqua vitæ*, & vinegar most sharp. This, the father of our Philosophy, cries out concerning this mystery. *Benedicta aquina forma, quæ Elementa dissolvit.*[4] But by this water most divine, the Elements of the stone can not be dissolved, & no perfect dissolution can there be, 'til completion of a proportionate digestion & putrefaction, whereon concludes the second Key to the first working.

### KEY THE THIRD

The third Key comprises in it longer suite of operations, than all the others together; right little have Philosophers spoken of it, for all that the perfection of our Mercury hangs thereon; the most reliable even, such as are Artephius, Trevisan, & Flamel, have passed over the preparations of our Mercury in silence, & there is hardly a one, who has not supposed, rather than teach, the longest, & most important operations of our practice. Wishing but to lend my hand upon this portion of the way, that you must take, & where for want of light, it is impossible to follow the veritable path, I shall be show myself less laconic than were the Philosophers, concerning this third Key, or shall at very least follow in order that which they have said upon the subject, so confusedly, that short of Heavenly inspiration, or the aid of a faithful friend, one shall, & this without doubt, remain lost in the Maze, powerless to find fortunate issue soever. I am certain, that you who are true children of science, shall derive great satisfaction, from the elucidation of these hidden mysteries, concerning the separation & purification of the principles of our Mercury, the which is effected by a perfect dissolution & glorification of the body from whence it springs, & by the intimate union of the soul with its body whereunto is the spirit the unique link, effecting such conjunction; this then is the intention, & essential gist of all the operations of this key, which finds its term in the generation of a new substance infinitely more noble, than the first.

When from the stone the wise Artist has made to spring forth the fountainhead of living waters, has expressed the resin of the vine of the Wise, & produced their wine, let him mark that within this homogenous substance, appearing in the form of water, are three & divers substances, & the three natural principles of all bodies, salt, &

sulphur, & Mercury, the which are the spirit, soul, & body; & albeit they seem pure & perfectly united, much is required still that they be more so; for when by distillation we draw off the water, the which is the soul & spirit, the body remains in the depths of the vessel, as a dead earth, black, & dregs, the which be it said, should not be held in despite; for in our subject, there is no thing which is not good. The Philosopher John Pontanus holds that the superfluities of the stone convert themselves into a veritable essence, that those who claim to separate whatsoever from our stone, understand nothing of Philosophy, & that all that is superfluous, refuse, dregs, & in fine the entire substance of the composite, perfects itself through the activity of our fire. This thesis opens up the eyes of those, who to effect an exact purification of the elements & principles, have convinced themselves they need take only of the subtle, & may discard the dense; but the children of science should not overlook that fire, & sulphur are hid within the earth's core, & that one must needs wash it carefully with its own spirit, for that the balm, the fixed salt, which is the blood of our stone, be thus extracted; herein then lies the essential mystery of this operation, the which shall be accomplished only should you observe an adequate digestion, & slow distillation. Follow therefore, O children of art, the precept given you by the candid Hermes, who in this place says, *oportet autem nos cum hac aquinâ animâ, ut formam sulphuream possideamus, aceto nostro eam miscere, cùm enim compositum solvitur, clavis est restaurationis.*[5] Knowing that none are more contrary than fire & water; let the wise Artist nonetheless bring peace between these enemies, who at heart love well each the other. Cosmopolitus has declared this mean in but a few words: *Purgatis ergo rebus, fac ut ignis & aqua amici fiant; quod in terrâ suâ, quæ cum iis ascenderit, facile facient.*[6] Be attentive therefore to this point, moisten often the earth with its own water, & you shall have, that which you seek. Need not the body then be dissolved in water, & the earth penetrated by its humidity, for that it be rendered disposed to generation? In the eyes of the Philosophers the spirit is Eve; the body Adam; let them be conjoined for the propagation of their species. Hermes says this same in other terms: *Aqua namque fortissima est natura, quæ transcendit, et fixam in corpore naturam excitat; hoc est lætificat.*[7] Indeed these two substances, which are of the same nature, but of two different sexes, embrace each the other with the selfsame love, & satisfaction as do man & woman, & together imperceptibly rise, leaving behind but few fæces in the base of the vessel; such that soul, spirit, & body, after careful purification, finally appear inseparably united in form nobler, & more perfect, than they had had theretofore, & as different from the original liquid form, as is the Alcohol of a wine perfectly refined, & purified of its salt, from the substance of that wine, whence it is taken; not only is this comparison most apt, but also it affords to the children of science a precise knowledge of the operations of this third Key. Our water is a living fountainhead, streaming from the stone, by a natural miracle of our Philosophy. *Omnium primò est aqua, quæ exit de hoc lapide.*[8] 'Twas Hermes declared this great truth. And recognised furthermore, that 'tis this water is basis of our art. The Philosophers give it divers names; calling it now wine, now *aqua vitæ*, & now again vinegar, or oil, according to its different degrees of preparation, or the divers effects, of which it is capable. Hosowever that may be, let me warn you that it is properly the vinegar of the wise, & that in the distillation of this divine liquor, occurs the same thing as with that of common vinegar; from this may you draw great instruction; the water & phlegm rise first; the oily substance, in which consists the efficacy of our water, last. And it this substance median between earth, & water, which in the generation of the Philosophic child, performs the function of the male; Hermes brings this to our attention right forcibly with the following words so clear;

*unguentum mediocre, quod est ignis, est medium inter fæcem, & aquam.*[9] Not contenting himself with showing these lights unto his disciples, he further explains to them in his emerald table, how they should in this operation proceed. *Seperabis terram ab igne; subtile ab spisso suavitur, magno cum ingenio.*[10] Mark that you smother not the fires of the earth in the waters of the flood. This separation, or rather extraction must needs be effected with great judgement.

You must thus needs to utterly dissolve the body, for that you might therefrom extract its humidity entire, the which contains this precious sulphur, this balm of nature, & marvellous unguent, without which hope not ever to find in the bottom of your flask that blackness so sought after by the Wise. Reduce the composite entire then unto water, & make of the volatile & the fixed perfect union; such is the precept of Senior, & it merits your attention. *Supremus fumus, says he, ad infimum reduci debet, & divina aqua Rex est de cælo descendens, Reductor animæ ad suum corpus est, quod demùm à morte vivificat.*[11] The balm of life is hid in these despicable fæces, & 'tis these you must lave with the heavenly waters, until that you have removed all blackness, & thence will your waters become animate of this fiery essence, which effects all marvels of our art. Better counsel thereunto, than that of great Trismegistus, can I not give. *Oportet ergo vos ab aqua fumum super-existentem, ab ubguento nigredinem, & à fæce mortem depellere;*[12] & more, the one means to success in this operation, is by that same Philosopher taught, who immediately thereupon adds; & *hoc dissolutione, quo peracto, maximam habemus Philosophiam, & omnium secretorum secretum.*[13]

But that you deceive not yourselves as regards this term *composite*; I shall affirm that the Philosophers have two species of composite. The first is that of nature; whereof I spoke in the first Key: for 'tis nature makes it in a fashion incomprehensible to the artist, who does but to it lend his hand, in the administration of things external, by which means does she bear forth, & produce that admirable composite. The second is the composite of the art; & 'tis the artist does effect the intimate union of the fixed unto the volatile perfectly conjoined, with all prudence he might have acquired from a profound Philosophy; the composite of art is not exactly alike in the second, & third workings, but 'tis nonetheless ever the artist makes it. Geber defines it a mixture of quicksilver & sulphur, that is of the volatile & the fixed, reacting the one upon the other, respectively volatalising, & fixing, the one the other till the state of perfect fixity be achieved. Consider the example of nature, & you shall see that the earth produces no fruit, but that it is penetrated by its humidity, & that the humidity continues sterile; but that it be held, & fixed by the dryness of the earth.

Be assured therefore, that there shall be no goodly success in this our art, but that in the first working, you do purge the serpent born of the alluvium of the earth, bleach these fæces feculent & swart, that therefrom you separate the white sulphur, the *sel armoniac* of the wise, which is their chaste Diana who in the basin shall lave herself. All this mystery is but of the extraction of the fixed salt from our composite in which consists the energy entire of our Mercury. The water, which rises by distillation, carries up with it a portion of this fiery salt; such that the affusion of the water upon the body several times over reiterated, impregnates, fertilises, & fecundates our Mercury, & renders it proper to fixation.; the which is the term of the second working: Finer exposition of which truth can I not find, but in these words of Hermes: *Cum viderem quod aqua sensim crassior, duriorque fieri inciperet, gaudebam; certo enim sciebam, ut invenirem quod quærebam.*[14]

Do you have but right mediocre knowledge of our art, what I have here said shall more than suffice, for that you understand that all operations of this Key, ending the

first working, are but to digest, distil, cohobate, dissolve, separate, & conjoin, & this with gentleness, & patience: in this manner shall you have not only a complete *extractio* of the juice of the vine of the wise; but you shall furthermore possess their veritable *aqua vitæ*; & I place you on guard that the more you shall rectify, & the more labour thereon, the more shall it acquire penetration & virtue; the Philosophers named it *aqua vitæ* in that it restores life to metals; but it is more properly called the great moon, by cause of her splendour, with the which does she shine; & they call it also the substance sulphuric, the balsam, gum, viscous humidity, & the vinegar most sharp of the Wise, etc.

Nor is it without reason that the Wise do give to this Mercurial liquor the name of pontic waters, & of vinegar most sharp; its exuberant ponticity being the veritable character of its virtue; and, as I have said, furthermore, that there occurs during its distillation, the same as occurs with vinegar, in that the phlegm & water rise the first, the sulphurous & salty parts rising last; separate the phlegm from the waters, unite the water & fire, the Mercury & sulphur, & you shall at last perceive the black most swart, blanch the crow, & redden the swan.

Since it is to you only that I speak; true Disciples of Hermes, I shall reveal to you a secret, that never you will find in its entirety in the books of the Philosophers. Some are content to say, that of their liquor are made two Mercuries, the one white, & the other red. Flamel more particularly says, that one is to utilise a citrine Mercury, in the imbibitions of the red; & warns the children of the art not to be mistaken upon this point; assuring also that he had been mistaken himself, were it not for the warning of Abraham the Jew. Other Philosophers teach, that the white Mercury is the bath of the moon, & the red the bath of the sun: but none sought clearly to set forth unto the children of science, by what path might these two Mercuries be obtained: if you have well understood me, already you are illumined upon this point. The lunar is the white Mercury, the vinegar most sharp the red; but to better determine these two Mercuries, feed them upon a flesh of their own species, the blood of the slaughtered innocents, which is to say, the spirits of the bodies, are the bath, wherein the sun & the moon shall bathe.

I have here set forth a great mystery if well you will reflect upon it: those Philosophers who of it do speak, pass lightly o'er this important point: the Cosmopolite spoke of it right spiritually by means of an ingenious allegory, declaring the purification & animation of Mercury: *Hoc fiet, he says, si seni nostro aurum et argentum deglutire dabis, ut ipse consumat illa, et tandem ille, etiam moriturus comburatur.*[15] He concludes & describes the magistracy entire in the words: *Cineres ejus spargantur in aquam, coquito eam donec satis est, & habes medicinam curandi lepram.*[16] Nor should you ignore the fact, that our ancient is our Mercury; that this name well suits him, in that he is the first matter of all metals; the same Author says, that he is their water, to which he gives the name of steel, & of lode-stone, & he adds thereto for greater confirmation of that which I have disclosed to you: *Si undicies coit aurum cum eo, emittit suum semen, & debilitatur ferè ad mortem usque; concipit chalybs, & generat filium patre clariorem.*[17] Whereon therefore a great mystery, have I disclosed to you without enigma; this is the secret of the Mercuries twain, the which contain the twin tinctures. Conserve them separately & confound not their species, for fear that they engender a monstrous progeny.

Not only is it that I dilate more intelligibly than any Philosopher before me has done, but also I lay bare all that is most essential in the practice of our art: if you meditate thereon, if you apply yourselves to understanding it well; but, most especially, if you labour on the lights that I have given you, I doubt not but that you shall find that

which you seek; & should you not come to such knowledge, by the way I have marked out unto you, certain am I that with great pains only shall you come at your goal, by simple reading of the Philosophers. Do not then despair; but seek out the source of the liquor of the wise, the which contains all that is necessary to the operation; it is hid beneath the stone; strike upon it with the rod of magic fire, & a clear fountain shall thence burst forth; do then as I have shown; prepare the bath of the King with the blood of the Innocents, & you shall have the animate Mercury of the wise, which loses never its virtues, if you but preserve it in a vessel well stopped. There is such sympathy, says Hermes, betwixt purified bodies, & spirits, that they quit each the other never, once that they be joined together; for that such union is like unto to that of the soul with the glorified body, concerning which faith tells us there shall be no further separation, nor death. *Quia spiritus, ablutis corporibus desiderant inesse, habitis autem ipsis, eos vivificant, & in iis habitant.*[18] By which you may see the merit of this precious liquor, unto which have the Philosophers given more than a thousand divers names, it is the *aqua vitae* of the wise, the water of Diana, the great moon, water of quick silver; it is our Mercury, our incombustible oil, which when cold like unto ice congeals, & in the heat, liquefies like unto butter; Hermes calls it the foliated earth, or earth of leaves; not without great reason; for if you observe it well, you shall see that it is leaved through & through; in a word 'tis the fountain most clear, whereof the Count of Treves makes mention; in fine it is the great Alkahest, which radically dissolves all metals; it is the true & permanent water, which having dissolved them, unites with them inseparably, augmenting both their weight & tincture. Hermes assures us our Mercurial water shall, once that it has been changed into earth, have acquired all virtue, wherewith Philosophers endow it.

#### KEY THE FOURTH

The fourth key of the art, is the entrance unto the second working; it is that which reduces our water unto earth; there is in this world but this one, unique water, which might by simple cooking be converted into earth; for the Mercury of the wise holds within its core its own proper sulphur, the which does coagulate it. The terrification of spirit is the sole operation of this working; cook therefore with patience; if you know well how to proceed, you shall not be long in awaiting the signs of this coagulation, & if they appear not in due time, then shall they not arise at all; for that is a sign indubitable that you have failed in some essential thing, in the first operation; for to corporify the spirit, which is our Mercury, it must needs be that you have well dissolved the body, wherein is enclosed the sulphur, which brings about coagulation of the Mercury. *Vis ejus integre est, si in terram conversa fuerit.*[19] Earth admirable in its fecundity; promised land of the wise, who knowing how to make fall thereon the heavenly dews, cause it to bring forth fruit of inestimable price. The Cosmopolite well expresses the benefits of this blessed earth. *Qui scit in aquam congelare calido, & spirtum cum eâ jungere, certè rem inveniet millesies pretiosiorum auro, & omni re.*[20] Nothing approaches the merit of this earth, & this spirit perfectly conjoined, in accord with the rules of our art; these are the true Mercury, & true sulphur of the Philosophers, the living male, & female who contain in them the seed, which alone may procreate a son more illustrious yet than his parents. Cultivate therefore & with care this precious earth; water it often of its own humidity, & dry it out as many times, & you shall increase no less its qualities, than its weight, & its fecundity.

#### KEY THE FIFTH

The fifth key of our work is the fermentation of the stone with the perfect body, to make thereof the medicine of the third order. Concerning the operation of the third working I shall say nothing in particular; but only, that the perfect body is a necessary leaven to our dough: that it is the spirit effects the union of the leaven with the dough, just as does water soak the flour & dissolve the yeast, in the creation of a fermented dough, appropriate to the making of bread. This comparison is right apt, & 'twas Hermes first made it. *Sicut enim pasta sine fermento fermentari non potest; sic cum corpus sublimaveris, mundaveris, & turpitudinem à fæce separaveris; cum conjungere volueris, pone in eis fermentum, & aquam terram confice, ut pasta fiat fermentum.*[21] Concerning fermentation, the Philosopher here reiterates the working in its totality, showing that just as the Mass of dough, becomes in its entirety leaven, by the action of the ferment, which to it is added; so too the sum of the Philosophic confection becomes by this operation a leaven proper to the fermentation of a new substance, & to the multiplication of it unto infinity.

If now you well observe how bread is made, you shall find the just proportions, which to observe, between the substances composing your Philosophic dough. Do not then bakers utilise greater quantity of flour, than of leaven, & more yet of water than of flour, & of leaven? The laws of nature are those to be followed in the practice of this our Magistracy. I have given you all necessary instruction upon the principal points; such that it would be superfluous to say more, particularly touching upon the final operations, concerning the which the Philosophers have shown themselves much less reserved, than as to the earlier, which are the fundamentals of their art.

## KEY THE SIXTH

The sixth key teaches of the multiplication of the stone, for the reiteration of the same operation, the which does consist but in opening & shutting; dissolving & coagulating; humectation & dessication; whereby are the virtues of the stone augmented unto infinity. Since it has not been my intention to describe the practice of the three medicines in their entirety, but to instruct you simply as to those operations which are most important, as regards the preparation of Mercury, o'er which the Philosophers pass generally in silence, to hide from the profane mysteries, which are but for the wise; I shall tarry no longer upon this point, & say naught further either concerning that which pertains to the projection of the medicine, in that the success you seek depends not on that; I have given extensive instruction only upon the third Key, for that it consists in a long series of operations, the which, albeit simple & natural, require nonetheless a great intelligence of natural law, & of the qualities of our materia, as also a perfect knowledge of chymistry, & of the divers degrees of heat, adapted to such operations.

I have led you by the direct path, & without detour; & if you have marked well the route I have traced to you, certain am I that you shall directly come to the goal, without erring. Know me right willing in my intention, that I have spared you a thousand labours, & as many pains, that I myself should have suffered on this arduous journey, were it not for like aid similar unto that I have given you also in this letter, stemming from a heart sincere, & a tender affection for all veritable children of science. I should be most grieved for you should you, like myself, & knowing already the true materia, pass fifteen years entire upon the work, study, & meditation, & come not to extract from the stone, its precious sap, the which it encloses in its breast, for cause that you know not the secret fire of the wise, which causes to stream forth from this plant to the sight both parched & arid, a water which wets not the hands, & which

by magical union with the dry waters of the ocean of the wise, resolves into a viscous water, a mercurial liquor, which is the principle & fundament, & key to our art: transform, separate, & purify the elements, as I have shown you, & you shall have the true Mercury of the Philosophers, the which shall furnish you the fixed sulphur, & medicine universal.

But I place you on guard, that albeit you have knowledge of this secret fire of the wise, yet have you not come entire to the end of the first course. I myself erred several years in the route yet to be traversed, to arrive at the mysterious fountain, wherein the King does bathe, rejuvenate himself, & resume a life new & exempt from all infirmity; you must needs know also to purify, heat, & animate that Royal bath: it was to lend aid in this secret path, I drew out what I had to say upon the third Key, wherein are all its operations to be deduced. Of my heart I hope, that the instructions I have given you, lead you direct to the goal. But bear in well mind O children of science, that knowledge of our Magistracy stems more from the inspiration of Heaven, than from illuminations one might garner of one's own accord. This truth is borne out by all Philosophers: wherefore is it not enough to labour; but pray assiduously; read veridical & authentic texts; & meditate day & night, upon the operations of nature, & upon what conceivably she might do, were she aided by the attentions of our art, & in this way shall you of a certainty succeed in your undertaking.

And this is all I have to say, in this my letter; I had no wish to hold forth at length, such as the subject might demand; nor have I spoken of aught but what is essential to our art; such that if you know our stone, which is the sole & unique material of our stone, & if you have the intelligence of our fire, which is at once both secret & natural, than do you hold the keys of the art, & you may calcinate our stone, not by a vulgar calcination, the which is achieved by the violence of the fire; but by the calcination Philosophic, the which is natural through & through.

Mark also this with the most illumined of the Philosophers, that there is this difference, between vulgar calcination, effected by the force of fire, & natural calcination; that the first destroys the body, & consumes the greater part of its radical humidity; but that the second not only conserves the humidity of the body, it calcinates; but also considerably augments it.

Experience will teach you in practice this great truth; for you shall find indeed, that this Philosophic calcination, which sublimes, & distils the stone as it calcinates, greatly augments its humidity: the reason for this is, that the fiery spirit of the natural fire incarnates in the substances which are to it analogous. Our stone is an astral fire, which harmonises with the natural fire, & which like unto a veritable salamander takes birth, nourishment, & growth from the fire Elementary, to which it is geometrically proportionate.

The Author's Name is in Latin in the following Anagram:

## A Magnificent and Select Tract on Philosophical Water

**Most beloved son**, so that I might explain to you, and write as a memorial a concise understanding of the one, true philosopher's stone, and of how to proceed with its preparation, you must know that this stone is made of and born of two things, namely *ex corpore et spiritu*, of the male and female seeds, that is, of water of mercury and *corpore solis*. We can find enough proof of this in the many true writing of the philosophers, and so I will mention many of the writings they left behind. Then it will be seen how the purified *mercurius* is poured into and dissolved in a spiritual water. The philosophers call this the *prima materia* of metals. They also call it *lunae water*, *aqua vitae*, *Q. Essentia*, or a fiery and burning liquid liquor. The metals can be dissolved and freed from their hard, stiff bonds in this water, and so return to their first, their original nature, just as the water of mercury has done. This is why the philosophers wrote for us in their books the example of how frozen ice turns to water again when heated, for it was water before its coagulation too. They also say that whenever an object's origins or *principalis* might be, it can be returned to that original state in this way. It will become that which it was in the beginning. The philosophers also wrote on the following subject in their books; that the species of metal cannot be turned into gold or silver if they have not first been reduced and returned to their original material. Note carefully, my son, that this reincarnation of the metals is possible only if the *prima materia metallorum*, or water of mercury, is used. It is not possible, and never will be possible with any other substance in the world. For this water is closest to the nature of the metals, and so it can never be separated or parted from them when the two are mixed. The philosophers have also given us explanations of this water in the '*Turba*' and in other books in which they say the following: Nature enjoys its Nature, Nature contains Nature, improves Nature, reduces Nature, Nature is superior to Nature. This is how we can recognize this blessed water and its preparation: It is a heated, fiery, all-penetrating spiritus, the philosophical water and the hidden key to this art. For without it all alchemical works are useless and in vain. So, my son, you must understand and remember that the whole basis of the philosopher's stone is this: That we can bring about a rebirth of the perfect and whole *corpus solis*, through the *prima materia metallorum*, or water of mercury, so that it is reborn through the water and the spirit, just as Christ says: Unless a man has been reborn through the water and the spirit he can never see the Kingdom of God. And so it is with this art. I say to you, my son, unless the *corpus solis* is sown, it is useless and fruitless, just as Christ says. Unless the grain of wheat falls onto the earth and dies there and rots, then it will bear no fruit. In this way the *corpus solis* is reborn through the water and the spirit, and immediately a clearer, more astral, eternal and immortal body grows from it, which bears fruit and multiplies like the *vegetabilia*. On this subject the philosopher Rogerus Baco says: I assure you, thus will the *astrum*, give of itself to the body of gold which has been clarified in this way, so that it will never lose its riches and its strength until the day of the Last Judgment. For the body is perfect, purified of all other elements and it is beautiful. But unless it is reborn it will never become anything bigger, or clearer, or higher or better. Unless you know and recognize this rebirth from Nature and new birth of metals through the water and the spirit of the *prima materia*, it is futile to practice this art. For believe me, in all truth, without this all is false, a lie, and useless, and in vain. It is impossible for it to happen in any other way. Because of this the philosophers wrote wonderfully in their books and said that everything bears an image of itself and that man will reap what he sows, and nothing else. In the same way the philosopher Angelicus said: Sow gold and silver so that they can bear fruit by Nature's means. For this reason, my son, you must search in your work for a corpus other than gold, for all other corpora are stinking and incomplete. And so the philosophers have chosen gold above all other bodies as the most complete thing in the world, as the substance which lights up all other corpora and which pours life into them, while it has a

fixed nature, an unburnable nature and a constant root in the fire. Rogerius also says of the body of gold that its nobility and perfection can never be altered, and that gold is the culmination of all natural births, and that nothing in the world is more complete. The philosopher Isaacus Hollandus speaks of the same substance in this way: Our stone can be extracted from nothing other than a perfect corpore, yes, from the most complete one in the world. If it were not a perfect corpus, what sort of stone could we extract from it? The stone must have the power to give life to all dead corpora, to purify all that is impure, to make all that is hard and to make all that is hard soft, and it would be truly impossible to extract such a powerful stone from an incomplete and frail corpore, just as it is also impossible to extract a good and perfect thing from something imperfect and unclean. How many people deceive themselves that such an extraction is possible, but they are always mistaken, and in truth they are great fools. Therefore my son, take care that the red philosophical sulphur is in the gold, as Richardus proved and King Calid said. Our sulphur is no common sulphur, but is fixed from mercurial nature and does not flee the fire. All other philosophers also confirm that their red sulphur is gold.

But, my son, the philosophers also say in their books that common gold or silver is not their gold or silver. While their gold and silver is alive, common gold and silver are dead, and as such cannot perfect other, incomplete corpora, nor impart their completeness to them. If they had to give away some of their perfection they would remain incomplete themselves, for they would have no more perfection. Now my son, the words of the philosophers are true and founded on fact, for it is impossible for common gold and silver to make other, complete corpora perfect, unless, as I said before, the *corpus Solis* and *Lunae*, is reborn through the water and spirit of the prima material and an enlightened spiritual, clarified, eternal, fixed and subtle, all penetrating body grows from this which will purify other perfect corpora and multiply. Therefore the philosophers have said of this: Such works are performed on their stone so that the tincture in it can be improved. This is why it is necessary for this stone to be treated better and more subtly than common gold and silver. The philosopher Berhardus writes on this subject in his book. He says: We take this body just as Nature created it. But it is necessary to make to make it even more perfect using this art (which must still follow the rules of nature) so that it, in its great perfection and with its many rays, can make the imperfect corpora and complete in weight, colour, substance, yes even its mineral origins and *principiis*. And if it had remained in the sate in which Nature would normally have left it, if it had not been perfected or made superior, how would the period of ten and a half months served us then? Arnoldus speaks on this very subject in his Epistle: In our stone gold and silver are to be found more strongly, invisibly and more maturely in *potentia et virtute*, for if this were not so, neither gold nor silver in our stone are to be found in great strength and in their essence in their stone, but they are not as visible as common gold or silver. Euclides confirms this in his great '*Rosario*': Nothing can come from one perfect things, he says, for it is already perfect and complete, just as Nature created it. We find a similar example in bread: When yeast-risen bread can be made from it. So it is too with gold, which is brought by nature over a long period of time to a complete end. It is therefore impossible to perfect other corpora with bad gold, unless the perfect corpus solis is dissolved again, so that it returns to its original substance, and it is turned into a true ferment and tincture through our work and art. On this subject the philosophers say that one can never achieve a good result until the gold and silver are joined together in one corpus. Now, my son, do not read the words literally, but understand the lumen metaphoric, for the philosophers say in their books that Luna is made of cold and wet Nature, and they also give this same definition to *mercurio*. So, for *Lunam*, we read *mercurius*, or water of mercury, or *prima materia* which is the philosophers *luna* or *Lunae* water, as can be read in the wonderful and profound book '*Clangor Buccinae*'.

And so, my son, you have had a short lesson that this art is useless unless we bring the perfecta corpora

back to its original essence by the philosophical fire or by the water of mercury. This original essence is a sulphuric water and not *mercurius vivus* as the sophists believe. For the original *materia metallorum* is not *mercurius vivus*, but a sticky sulphuric steam and a viscous water in which the three *principia* Sal, Sulphur, and Mercurius are gathered. You must be able to recognize the true and blessed water of mercury or the heavenly supernatural fire in which the corpora are dissolved and melted. For this knowledge is the greatest secret of them all, and it is only found in the power of God, whom we must beg for the secret. Of this the philosopher Rogerius says: God the Almighty created man and set him above Nature and all the animals, although he is natural and nothing more than Nature, apart from the life which God breathed into him. And it is God who is and must be the judge of all the works and their nature. This godly spirit within man forms our feelings and thoughts, just as it does in its own head. The natural spirit found in the first beginnings of Nature many indications on which it could base and found these thoughts.

Through our work and through this spirit in us God-like Adam makes us ready for the destruction of the whole world. And from the lit, burning, fiery spirit of the breath of God, St Peter utters with quiet words that the elements will melt in the heat and the earth and all her works will burn in it, and a new world will be born, and it will be wonderful and precious and good, as is told in the *Apocalypsi*. And on this subject the philosopher concludes, saying, as we heard from St Peter, that a collapse of all the elements of the world shall occur in the heat of the fire. Take note that in this art too (which reflects nature) here too the fire must do this and perform these acts. Then, my son, turn your thoughts to the water which is burned, destroyed and melted with the *corpus solis*, which Rogerius confirms is a complete and created world. This too is no common fire, for common fire can neither burn nor destroy gold, but rather it is a supernatural, indestructible fire, the strongest of all fires, yes a hellish fire, the only one which has the power to burn gold, and to free it from its hard and stiff bonds. You must understand and know that this supernatural fire which has such power over gold and other metallic bodies, this fire alone is the spiritual, sulphuric, fiery water of mercury in which the *corpus solis* is melted and burned, and from this melted and destroyed substance a new world is created and born, a new world which is the heavenly Jerusalem, an eternal, purified, subtle, penetrating and fixed body which can penetrate all other corpora. That is why Rogerius says: It would be like a supernatural fire which will break, dissolve and mix together all the elementa in the world, and then the new work will be reborn from the broken, transitory work of the melted elements and will become an eternal work. Thus has the Holy Trinity also shown us a supernatural fire in the heavenly stone. My son, the philosophers have hidden this supernatural fire in their books and have called it in parabolic speeches by innumerable names. Some of their special names for it are *Balneum Mariae*, damp horse dung, menstruum, urine, milk, blood, *aquam vitae*, and such like. Bernhardus says of this fire: Make a vaporous and constant fire which is not too powerful, but subtle, airy, clear and contained, indestructible, all-penetrating and eternal. And he goes on to say more on the subject. In truth, I have told you all about the wisdom of the fire, for this vaporous fire can do everything. For this reason he also says that one must consider his words about the fire often and deeply. A wise man will soon deduce that he must not take these words to mean a common fire, but rather a supernatural fire. Maria Prophetessa also indicates that the element of water melts the corpora and turns them white. Raymundus Lullius writes on the subject of this fire (which he calls menstrum) and its preparation in his '*Testamento noviss. in codice, in Anima metallorum, Luce Mercuriorum*' and in '*Libro mercuriorum*' in the book '*De Secretis Naturae f. de Q. Essentia*' and in the '*Elucidario Testamenti*' ch. 4, he says that it is not human, but rather angelic to reveal this heavenly fire, and that to know this is to know the greatest secret of all. He also says, in figurative expressions, that this fire of the wise is composed of horse dung and live calcium, I will explain what is represented by the live calcium elsewhere. I have already explained what is meant by the horse dung, namely that the horse dung is the water *prima materia*, for that too is warm and damp, just like horse dung,

but it is no ordinary horse dung, as many ignorant people think. This is why the philosopher Alanus says: the philosophers have called the damp fire horse dung, in whose dampness the hidden warmth is contained, for it is a characteristic of the fire in a horse's stomach that it does not destroy the gold, but rather increases it for the sake of its dampness. Alchidonius says: Our medicine is to be hidden in the damp horse dung which is the fire of the wise. Alanus speaks in a similar way. Dear son, take great care with the decomposition or disintegration. The decomposition must occur in a gentle warmth, that is, in a damp horse dung. Similarly, Arnoldus de Villa Nova writes in the ninth chapter that the heat of horse dung should be in the fire. Alphidius too says: It must be cooked and buried in the heat of horse dung, Aristotle too: The earth or the corpus will gain no power unless it is sublimated in horse dung. For this reason Hermes says: cook and bake it in the warmth of a horse's stomach; and Morienus: if you do not find what you are looking for in the horse dung, then you can count your losses. Arnoldus agrees: You must search for no other fire than this, for this is the fire of the wise, the melting oven of the wise, their calcinating, sublimating, reverberating, dissolving, coagulating and figuring oven, for this water can dissolve and calcinate all metals and melts red and white with them. The '*Turba*' and '*Senior*' also speak of this: Our water is a fire and our water is stronger than all fires, for it makes a pure spirit from the *corpore* of gold which a natural fire cannot do, although natural fire also has something to do with it. For our fire enters into an earth or powder so that the gold burns more greatly than natural fire. Calid too says: In truth, it is a fire which burns and grinds all things.

But how this philosophical water or fire, which is *aqua mercurii*, is prepared has been hidden by the philosophers, as Raymundus Lullus writes mysteriously in his works. It is first necessary for the mercury to be purified of its outer dampness and earthliness, but this must not be done with harmful and destructive things which would destroy its noble, fruitful, green and fertile nature. Avicenna, Arnoldus, Geber, Raymundus in codicillo and other philosophers state that mercury is best purified through the sublimation of commonly prepared salt. The sublimate is dried and mixed with Sal Tartari, is ground per retortam, then cut up. This must be done several times. In this way the *mercurius* will be rid of its outer dampness and foecibus. This purgation, says Bernhardus at the end of his epistle, does not harm the *mercurius* because the hot water and the salt do not penetrate it. But you must understand my son, that while the *mercurius* is a uniform and inseparable substance and essence, we cannot completely purify its outer whiteness, for its earthy impurity lies hidden in its innermost depths and it cannot be separated from it by any method of sublimation, how ever many ignorant people have the audacity to suggest this. For this reason the following method must be used. The *mercurium vivum purgatum* must be freed from the bonds with which Nature ties it so securely to the earth. These bonds must be loosed and it must be returned to its very first essence, namely a sulphuric, spiritual water, without the addition of any foreign bodies in the world, as Rogerius Bacon testifies to under the title '*De Mercurio*', and as Raymundus also says in the '*Theorica*' of his testament: Unless it is putrified in this way and dissolved, the menstruum will not be worth a fig. But when the living mercury, purified of all foreign bodies, has been freed of its bonds, and returned to its original water, then we can purify it inwardly and separate the *spiritum* from the water and its earthliness by distillation. The philosophers have spoken in secret words about the separation, in a way that a hard-headed man would not easily understand. They have written of it mysteriously and in a figurative manner in their description of the distillation of wine that the spirit of wine is mixed with a great deal of water and worldly earthiness. But the dry *spiritum*, or spirit of wine, can be separated from all phlegmatic moisture and worldly earthliness by artificial distillation. In other words, the whole *spiritum* is separated from the water of the wine, and the water from the earth. And so the yeast, through whose calcinations its own white salt is extracted, remains. This is married again with the spiritum and distilled again several times until all the sal

nitri has then gone into the lid of the distilling vessel with the *spiritu*. In this way the power of the *spiritus* is greatly strengthened and heightened by the sal. Truly, the philosophers have given us a remarkable figurative description, which we should also follow in the description of the water of mercury.

For when the latter has been dissolved, we should do exactly as was done to the wine: By the sublimation of the water (or phlegma) from the *spiritu*, the *spiritum* is separated from the earth, the earth is rectified and married again to the *spiritu*, and they are distilled again and again until both substances are to be found in the lid of the distilling vessel. Of all the philosophers, none has written better and more clearly on this subject than Raymundus Lullius, in his '*Testamento Novissimo*' and also in his first testament '*In Libro Mercuriorum, libro Q. Essentia*' in which he explains clearly and at length that after the putrefaction, separation and distillation of the philosophical spirit of wine, the spiritual water is mixed and distilled again with its earth, and they are both put over the alembic together. He also explains that this philosophical wine or menstruum is heightened and strengthened with its own salt. And also you must also understand that this water, menstruum or philosophical spirit of wine dissolves its own corpus or living *mercurium* into the original essence or water, and is then multiplied ceaselessly through the putrefaction and the distillation. What is said of the extract of this water is confirmed by Arnoldus de Villa Nova when he says: It is a substance full of foul smelling vapours and which contains a gross moisture. From this substance the artist separates the philosophical moisture which is easy to work with and which is as clear as tears. The *Q. Essentia* lives in its metallic form in this substance. It causes no discomfort to the metals, and the tincture of the whole metal can be gathered in it. For it contains Nature's *Argenti Vivi*, and the nature of *sulphuris*. On the subject of the distillation of this menstruum or water '*Rosarius Philosophorum*' says that you should take great care that the dishes in which you wish to purify your spirit are made of glass, so that the spirit can find no place to escape through, for it often slips quickly through the holes in dishes. And once the red spirit has escaped all the artist's work is in vain. The red spirit is what the philosophers call blood and menstruum. So take care with your dishes and with any cracks in your dishes, so that you can catch the dry spirit with its blood in a receptacle, without letting its power escape. Store it carefully until you begin to work on it. But seeing the distillation is more important than reading about it, and none can become a Master without having first been a pupil. For this reason take great care over your work. Using a receptacle distill the element at first over a gentle fire, and when it has been distilled off, put it aside and replace it with another receptacle. Make sure all the cracks are tightly sealed so that the spirit cannot escape. Make the fire a little stronger. A dry yellow *spiritus* will rise into the lid of the distilling vessel. Keep the fire burning steadily for as long as the spirit is yellow. Then, when the alembic begins to turn red, make the fire a little stronger, and keep it at this temperature until the red spirit and the blood have been completely distilled off and are floating in the lid of the distilling vessel like clouds in the sky. As soon as the red spirit is distilled off, the lid will turn white. Stop as soon as this happens. You now have the two elements air and water in the receptacle, and you have separated the right matter.

As you will see, you now have the *primam materiam metallorum* in which corpora can be reduced. For all metals have their origin in water, and water is the root of all metals. That is why they are reduced to water, just as frozen ice becomes water again in the warmth, for it used to be water, before it was frozen. So do not be surprised, for all things on the earth are like this, they all have their origins in water. Oh there are so many of them! But you must not think about their origins. You must work on. This is the key to the whole work, the key which dissolves the corpora at the beginning, it is father and mother, it opens and locks them, and reduces them to that which they were in the beginning. It dissolves the corpora and coagulates with them, the spirit is led to the water, that is, the power of the spirit is seen there taking effect,

and this happens when the corpus is placed in the water. On this subject the philosopher says: There is something which everyone recognizes, and whoever does not recognize it will rarely, perhaps never find it. The wise man will keep it and the fool will throw it away, and the reduction comes easily to the man who knows it. But, my son, the greatest secret of all is how to free the stone or *mercurium vivum* from the natural bonds with which it is bound to the laws of Nature, that is, how to dissolve it and return it to its original water. For if this did not happen, all our work would be in vain, for we could not separate and extract the true spirit or liquid essence which dissolves all *corpora*. And all the philosophers have kept this dissolution secret, and God the Almighty in His Power has ordered them to do this, and they have cursed and damned the men who have revealed it. For this reason they have spoken only briefly and subtly of the return of this raw body to its original essence, so that it can remain hidden to the ignorant. But you, my son, must understand that this dissolving of the living *mercurii* to its original state is difficult without knowledge of certain methods, but no sophistic methods can be used, as are used by many coarse ignorant and unknowing fools, who change the *mercurium* into water using many marvelous arts and believe that it is the true water. They sublimate the *mercurium* by *corrosiva* with all sorts of salts and vitriols, whereby the sublimated *mercurius* draws the spirit of the salts into itself. Then they dissolve the sublimate in water in Balneo or in the cellar or in various other ways. Then they turn it into water using salmiac and herbs, salves or *aqua fort*, using peculiar apparatus and many sophistic rules, but all of this is mere fantasy, nonsense, useless and in vain. Some of them also think that they can separate certain things from the water of mercury and that it will become the true water which the philosophers desire. The reason for this is simply that they do not heed the words of the philosophers which say quite clearly that it should be mixed with no foreign object on earth. And Bernhardus says in his '*Epistle*': As soon as the *mercurius* has been dried out by the salts, alum and *aqua fort*, it will no longer dissolve. But take note, my dear son, of what I am about to tell you, and of how the philosophers have left an account for those who understand their books, namely, that this water cannot be prepared using strange methods in the world, but rather, it can only be prepared using natural means; together with Nature and from nature. These words are bright and clear to those who understand, so this time I will not explain it openly, but I will write it down in a special little tract, but as a memorial I will add here the following verses:

Take one that is fresh, pure, living, white and clear,  
Tie its hands and feet well  
With the strongest rope you can find  
So that it dries and is choked  
In the House of Putrefaction,  
As Nature has shown us.  
By this same harmonious Nature  
It will be dissolved and it will rise to the original essence.  
It is a living, spiritual spring  
Which flows clearly and brightly from Heaven.  
It eats its own flesh and blood  
In order to multiply.

Whoever succeeds, with God's help, in attaining this blessed water should thank God, for he has in his hands the key which will open the closed locks of all metal chests, and can take gold, silver, precious stones, honour, power and good health. This blessed water is called the daughter of Pluto by the philosophers, it has strength and power over all reassures. It is also called the white, pure, tender and unspoiled maid of Beja and without it no birth or blending can occur. For this reason the philosophers have married this

tender and pure maid to Gabrico, so that they bear fruit, and when she was joined with Gabricus, he died. Beja swallowed and consumed him in her great love, as Arisleus tells in his '*Practica*': The spring or Fontina is like a mother to the king, for she draws him to her and kills him. But through her the king is resurrected again and he joins himself fast to her, so that no man can harm him. This is why the philosopher says that Gabricus is more precious and worthy and dear to the world than Beja, but he can bear no fruit alone. The philosophers have called this maid and blessed water by many thousands of different names in their books. They call it heaven, a heavenly water, a heavenly rain, a heavenly thaw, a May thaw, water of Paradise, an aqua fortis and an *aquam Regis*, a corrosive aquafort, a sharp vinegar and liquor, also *Quintam essentiam vini*, a waxy green juice, waxy *mercurium*, green water and *Leonem viridis*, quicksilver, menstruum or blood. They also call it urine and horse piss, milk and virgin's milk, water of arsenic, silver, Luna or Lunae water, woman, a female seed, a sulphuric steam and smoke, a fiery, burning spirit, a deathly all-penetrating poison, a dragon, a scorpion which eats its young, a hellish fire of horse dung, a sharp salt, sal armoniacum, a common salt, a lye, a viscous oil, the stomach of an ostrich which eats and digests all things, an eagle, a vulture and hermetic bird, a vessel and *Sigillum Hermetis*, a melting and calcinating oven, and innumerable other names of animals, birds, plants, waters, juices, milks and blood, etc. They have used all these names and written of it figuratively in their books. They have suggested that such a water is made of these things, with the result that all ignorant people who have searched for it in these things, have not found the desired water. You must also know, my son, that it can be made only from *mercurio vivo* and from no other thing on earth, and the philosophers have given it so many names that ignorant people cannot recognize it. And with that, I end this little tract, written in order that you might understand and learn that without this fire, all work in the world is in vain, all chemical processes are a lie, useless and false. The great '*Rosarius*' says that there is no more than one recipe, and with this one lock all the books of the philosophers are locked, just as if they were surrounded by a strong wall, and unless you know of, or have the key in your hands, you will never open the lock, or achieve anything fruitful. For the only key to the metal walls and gardens is this water. And this water is the strong aquafort which Isaacus refers to in his own work. He dissolves the corpora with it and uses it to make it spiritual. So note carefully that without this water all is false, all is a lie, in metals and minerals as well as vegetalibus and animalibus. You can dissolve, sublimate, distill, calcinate, extract, mix and compose what you will, you can dissolve it in the cellar, in Balneo, in dung, in aqua fortis and in any amount of strong waters which the alchemical processes teach, or which you can think up yourself, you can make oil or water or chalk or powder black, white, yellow and red. You can burn it, pour it in any way and teach the alchemical recipes, you can claim that you can make gold and silver with them. But it is all false, a stinking lie from beginning to end (without the water). For I myself --- with my own hands, or I should never have believed it --- I myself have learned this through error and misfortune. Be warned, my son, protect yourself from such sophists in Alchemy and the bragging of all deceitful people, just as you would protect yourself from the tiresome devil and from a terrible, impure and burning fire or poison. For through the sophistry of such cunning and false alchemy a man can bring about the death of his body and soul, his honour and goodness. Such deceit is truly more evil than the devil himself, even if one were to turn a whole principality against such people, everything would still be destroyed and still the lasting truth would not be found. It is for this reason that you must open your eyes, know and recognize the only key, flee all falsehood, for it is impossible to achieve anything true and useful in any way, other than the way I have described in this little book.

*The End.*

# A Short Enquiry concerning the Hermetic Art

A Short enquiry concerning the Hermetick art... By a lover of Philalethes. London 1714.

---

This Art, of bringing all Imperfect Metals to Perfection, hath been asserted for Truth, by Men of almost every Degree, in most Ages of the World; many of whose Books are extant.

They have declared, that they have made and possessed this great Treasure, which not only brings all Imperfect Metals to the Perfection of Sol and Luna (according to the Quality of the Medicine), but healeth all manner of Diseases in Human Bodies, even renewing Youth and prolonging Life.

Those Authors, from Age to Age, have justified one another's Testimony; alledging, as a farther Proof of the Art, that all that have understood it, have written most agreeingly of it, though contemporary, and unknown to one another in Person, or by Writing.

How far these Men's Writings have obtain'd, a very little Enquiry may serve; for most men look upon these (Alchymic) Books only as Cunningly devised Fables, and the Art itself as altogether impossible.

To which the (Alchymic) Authors answer, That it is not Lawful, nor Commendable to reprobate an Art, by Judges who are ignorant of its Laws as well as the Facts; and that the Ignorant Negative of such, is by no means sufficient to set aside the Affirmative Knowledge of so many Men of Unquestionable Credit, Piety, and Virtue, supported by Arguments and Circumstances of Uncontestible Force.

From which, together with the Excellency of the Things themselves (viz., Long Life and Riches, vide the 'Way to Bliss'), many have been induced to believe and seek after this Art.

Tis the Melancholy View that I have taken of these Men, that have occasioned the putting my own Thoughts into the Order you find them, hoping no Master will be offended, nor any Inquirer displeas'd.

When I compare, I say, the variety of these Men's Fortunes, Capacities and other Qualifications, with those the Philosophers have laid down for men like to succeed, it fills me with Pity, and makes me almost tremble to rehearse the words of Norton, viz.:-

"That of a Million hardly three,  
Were e'er ordain'd for Alchymy."

O sad Tidings to such Men! whose impair'd Healths, injured Fortunes and barren Practice, renders them more unfit every day than other, and instead of attaining that which should crown their Labours with success, are at length in danger of denying, if not cursing the Art itself.

I would pretty thoroughly enquire from whence this ill success, which attends the generality of Enquirers, proceeds, and accordingly shall mention a few chief

Impediments, in my Opinion.

First; But few of those that seek this Art, are qualified according to the Philosophers for attaining it; for they assert, That to find it requires the whole Man; as well as that, when found, it possesses him: Also that it is never found of any by Chance or by accidental Tryals, and casual Experiments; and that unless the Mind be kindled with a Beam of Divine Light, it will not be able to penetrate this most hidden Science.

These with many more Cautions, are plentifully set down in their Books, on purpose to inform and reform a great many Persons too rashly concern'd in these things; and yet how few take their Advice! undertaking this Study with much less than half the Man; constantly trying Experiments that have no Authority but their own idle Fancy; and consequently have Minds, in respect to this Science, as dark as Midnight.

Then add to these an almost Insuperable Difficulty, (hard enough to be overcome by those that can spare even the whole Man and are very cautious in their Practice, as having a pretty good Understanding of Natural Things in general, and of the Mineral Kingdom in particular) and that is the Subtilty of Stile so peculiar to Hermetick Philosophers.

Of this they often warn us, telling us also, that if it were not for this, they could not disclose, and at the same time hide their Secret. And though this be a Paradox, that at the same time they give light, they darken, yet they affirm it for Truth, with many other things hard enough to be understood; which yet must be understood before any one can profit by them, witness Geber, Sendivo, &c.

Also Norton has given a hint of this mysterious way of writing, and which indeed sufficiently shews that it will obscure, whether we can discern its Instruction or not, viz.:-

"If you consider how the Parts of Works  
Be out of Order set by the Old Clerks."

This breaking to pieces of the several Works, makes it almost impossible for a Tyro to make their Writings Tally; any one part not being rightly apply'd, the whole is incompleat.

Another tells us he has done this, by mixing Unusual Candor with Philosophical Subtilties, in such a manner as would render their Secret safe, tho' openly told; Nor is he wanting to admonish his Reader to be cautious in these things, viz.:-

"Yet beware,  
That thou mistake not; for I do aver,  
A mingled Doctrine these Lines do declare;  
For both ways in this Book of mine do claim a share:  
Learn to distinguish every Sentence well,  
And know to what Work it doth appertain.  
This is great Skill, which few, as I can tell,  
By all their Reading, yet could e'er attain;  
And yet of Theory, this is the main."

Wherefore 'tis obvious, there is no possibility of success, 'till it be learned to which Work their Sayings relate; which indeed is not easie, and is the top of Theory; nor can any speed upon any other, tho' never so finely spun, or fondly embraced.

And though Philosophers do sometimes affirm their Matters to be many, and their Works also; yet they very often, with equal Authority and Truth, assert the contrary;

Artephius saith:-

"Tho' we say in many places, take this, and take that; yet we mean, that it behoveth thee to take One Thing. For these things are so set down by the envious Philosophers to deceive the Unwary. Do'st thou, Fool, believe, that we do openly teach the Secret of Secrets? And do'st thou take our Words according to the literal Sound? Know assuredly, he that takes the Words of other Philosophers according to the ordinary Signification and Sound of them, he doth already wander in the midst of the Labyrinth, having lost Ariadne's Thread, and hath as good as appointed his money to Perdition."

By means of these seeming Contradictions, bolder steps have been taken by some of them in discovering this Art, than otherwise they would have done, and even some have dared to imitate, nay, so much as to repeat.

From hence I infer, That as much has been communicated to the World as can be expected, or that God will yet suffer to be discover'd by Writing. For this Art is declared, by those that have knowingly written of it, to be under his immediate Protection. Likewise that those that come to the Knowledge of it, shall admirably wonder at its Preservation; and that which will augment their wonder, will be, that so slender a Vail secures it; and which God makes a sufficient Guard against all the Attacks made by the unworthy. Vide Sendivo, etc.

Likewise, that as soon as any one discerns the Intention of the Philosophers, from the seeming Sense of the Letter, the dark Night of Ignorance will fly away, and a glorious Morning of Light and Knowledge will break forth: When Diana will unveil herself, Bathing in that most pleasant Fountain so much sought.

And that he will find himself in the High Road of Nature which is that Secret Way of Philosophers, viz., most easie, delightful and speedy; in which are no Storms, no Heterogeneities, nor any Fire, but the gentle one of Generation.

Norton asserts, That there are but few clerks that comprehend this Work, it being truly Philosophical. And he saith, That in this Work you must not begin with Quicksilver and Metals, as if in another Work you might; which other Work, he adds, if it be done in three Years, would be a blessed Chance, and which belongs to great Men; advising poor Men not to meddle with it, for that Errors in it may be committed above a Hundred ways; that it is a Work of Pain and Labour, as well as full of Perils.

That these things are so, we are sorrowfully confirmed, by a Modern Author, as is so well known by many. Intro-Apert.

Now as their Works differ, so their Waters or Mercuries differ also; for if you would calcine a perfect Metal, it must be done with Mercury; but if you would dissolve an imperfect Body (which is in the way to Perfection) it must be done with Mercurial Water, which is the Dew or Rain Water of Philosophers.

The perfect Body is calcin'd with a gross Humidity, and by a tedious Labour; but the imperfect Body is dissolved and purified in a much more subtile Mercury, by an easie Fire and little Toil.

And tho' this subtile Menstruum be the Mercury of the imperfect Body, yet it will (for a certain purpose) dissolve Sol, as warm water dissolves Ice, and will make its Body a mere Spirit.

This is the Fountain of Chymical or Hermetick Philosophy, concerning which it is said:-

" He that exactly knows the Magistry of this Water, no Words, or Secrets of

Philosophers, Sayings, Writings or Enigmas, will be concealed from him. And further, that it is stupendous in its Virtues, and the things out of which it is immediately drawn, are most secret above all others; also the means of extracting it most wonderful. In the Knowledge of which, all their Fires, Weights and Regimens lie hid."

The same Author affirms, that none can imagine its Splendour, except they see it, and then you will think you look upon a certain Celestial Body. Believe me, saith he, I have seen this Snowy Splendor.

Sendivo not only confirms the same in Words to this effect, viz., Believe me, for I beheld it, that that Water was as white as Snow, but adds, from whence it was drawn, viz., From the Beams of the Sun and Moon.

Nor is this said by him only, but by many more; I shall instance a few.

Artephius asserts, That 'tis drawn from the Beams of the Sun and Moon, yea, that this dissolving Water is the Soul of the Sun and Moon, their moist Fire, and the only Agent in the World for this Art.

The author of Arcanum Hermeticae, saith, "Let thy Mercury draw its Original from both these Lights."

Flamel, speaking of the Sun and Moon, saith, "They are of a Mercurial Source, and Sulphurous Original."

Another, viz., the Author of 'The Way to Bliss', saith: "That as the Sun is the Father of all things, and the Moon his Wife the Mother, (for he sends not down these begetting Beams immediately, but through the Belly of the Moon) and this double Spirit is carry'd in a Wind and Spirit into the Earth, to be made up and nourished."

Which double Spirit or Flame, Geber calls the immediate Matter of Metals.

You very well know, that Hermes himself, as well as most of his Followers, agree in these things; and 'tis our Business to observe wherein they do agree. Arnold says, "In our Imperfect Metal, there are the Sun, and Moon in Virtue and near Power." The Philosophical Work begins with this Heavenly Mercury, and an imperfect Body purified.

"There is a pure Matter" (saith another) "which is the Matter of Gold, containing in itself the Heat that giveth Increase." (Fire of Generation.) This is lock'd under thick Folds in common Gold; nor is it to be extracted, but by a strong and tedious Decoction, which is a Work liable to many Errors, and hath always occasioned those that wrought in it to complain of the length and trouble of it. But in the other Work, the Body is soon dissolved, by a sweet and kindly Bath, or moist Fire.

As the former Path requires much Pain and Patience to effect the Work, so this requires great Skill and Application to find it out, it being deeply concealed. The Masters of these Secrets do also affirm, that these Works (which are all one in the Beginning) may be conjoin'd, and made their grand Medicine. And I have been informed, that the way of making them one is but slenderly hid. For should they but change some Words (which they affect to use in order to conceal it) of one Syllable, and sometimes of two, for others of three, and sometimes of four or more, it would not be difficult for a Tyro, to conceive it. And the Reason given for this slender Covering is, that if any one should discern it and yet be ignorant of the means of both it would be of little avail; and that if he knew the means he could not long remain ignorant of the Practice. So that the Knowledge of the Means seems absolutely necessary in the first place.

These Norton calls his "Means Mineral," which, he saith, are no other than Magnetia and Litharge her Brother. And he asserts that to clarify them is the foulest Work of all.

And though he makes these means two, yet he tells you how they differ, viz., as a Mother from her Child, or as a Male from a Female: Which we see brings his to the general Doctrine of Philosophers, viz., Agent and Patient, which seems to be their one intention, whatever Skill they use to perplex their Sayings.

Litharge, he says, is a subtil Earth, brown, ruddy, and not bright.

"Old Fathers called it a thing of vile price,  
For it is nought Worth by way of Merchandise;  
No man that findeth it would bear it away,  
No more than they would an Ounce of clay."

He likewise saith, it is not to be sold in all Christian Ground, but thou must be fain to make it.

Magnetia is fair and bright, known by few, and is found in High Places as well as in Low and called by Plato, Titanos; these are the Materials to make Elixir; and addeth: -

"This Secret never was before this Day  
So truly shewed, take it for your Prey."

Now to apply these things to the Doctrine of Philosophers; Litharge must be their Brass or Philosophical Sol: Magnetia must be understood to be their Subtil Humidity or Philosophical Mercury; which is Living and not only so, but Inlivening; Clean and not only so, but cleansing; Volatile, and not only so, but Volatilizing, even the most fixed Body of Sol; and is the Radical Moisture of Metals.

How this is attained, is worthy our Inquiry, and whether they agree in the manner of preparing it, as well as from whence it is to be drawn, viz., From the Sun and Moon; for it seems it must have the Influences of both.

But to collect these Virtues requires a Mean, as Ripley hath it, speaking of the Green Lion,

"He is the mean, the Sun and Moon between, etc."

Also the Author of 'Hunting the Green Lion' saith,

"The Lion is the Priest, the Sun and Moon the Wed;  
Yet they were both born in the Priest's Bed."

By which Green Lion another saith, "All Philosophers understand Green Gold, multiplicable, spermatick, and not yet Perfected by Nature; Or Assa Foetida, because in the very first of this Operation or Distillation, a white Fume with a stinking smell exhales." It was by this strong scent that Flammel knew this Subject.

That this Agrees with the rest of the Philosophers, I need not enlarge to shew, it being well known to them who read their Books.

This Distillation, Hermes, as well as many others, declares must be made by a gentle Fire, by little and little, with great Discretion, lest the thick be mixed with the thin, the subtile with the gross, or the foul with that which is clean. Lully is very famous for his witty Description of this Operation, under the Figure of Distilling of Wine, which he sometimes also calls Juice of Lunaria, from which he extracts the Sweat with a gentle Fire, in the form of a white Water.

This is also called by other Names, as Adrop, Saturn, Brass, Leprous Gold, and

Imperfect Body; and which they all agree lies in great Obscurity, saturnine and foul, in the making of which there is a great Stink; that 'tis not fixed, a Medium between a Metal, and a Mineral partaking of the Nature of both, and very crude, containing an Argent vive, which is the Basis and Groundwork of their precious Medicine. And thus, saith the Philosopher, you will come to understand how Saturn contains the greatest Secret in this Art. This is "The Golden Branch, so much conceal'd, which all the Groves with Shadows overcast and gloomy Vallies hide, and which will follow none, but him that knows Dame Venus's Birds and him to whom of Doves a lucky Pair," etc. - Arcanum Hermeticae.

The Masters of this Science agree with one Voice in this, viz., That this Matter must be exactly purified, and dissolved into an Argent vive, of such Virtues as are nowhere else possible to be found.

This is performed by a wonderful Cohobation: the Number of which Cohobations are much varied: But in this they all agree, that there must be so many, till a total Dissolution and perfect Purity be known.

The time of doing this; some will have it, is hinted in Arcanum Hermeticae where 'tis said, "Cause the Dragon to Drink Three times the Magical Number Seven, until being drunk, he put off his hideous Garment."

Thus, I say, Three times Seven is Twenty-One, which some will interpret Days, and to which some other Philosophers seem to agree; but whether these are One and Twenty Days or Cohobations, he will rightly determine, who shall be blessed with the Knowledge of their "Light bringing Venus, and Horned Diana."- Arcanum Hermeticae.

Likewise the Philosophers agree in the Virtues of this Water, viz., that as it partakes of the Natures of both Sexes, so it acts the part of both, viz., Dissolving and Congealing. For they assert, That it will Congeal itself into a Lunar or a Solar Nature, (according to the design of the Workman) without any addition whatsoever.

There are also some Cautions given concerning Proportion in Compounding the Imperfect Body, as well as with relation to its Dissolution; for that in case of undue Weight or Measure, the Virtue will be much diminished, if not altogether spoiled. But if a due Proportion be observed, and a proper Fire given, the true Sign will follow. The true Union between the imperfect Leprous Body, and its Water, they have deeply conceal'd, as the Philosophers own, and Searchers find; because as they say, the rest is so easie in the Work of Generation, that 'tis hardly to be missed, by one that hath attained their wonderful Mercury, so united and purified.

Concerning which, they have declared, they have given such hints as are sufficient to an enlightened Mind; and that none shall ever dare to do it more openly, without a Curse from God.

But all have not done it with the same Candor nor by the same Similes and Enigmas; 'The New Light' under that of Chalibs; 'The Way to Bliss', by that of tile Witty Fire of Hermes, and so of the rest, Norton says:-

"Bacon did it darkly, in his Three Letters all  
But Raimond better in his Art general."

And since the Readers can expect no better Account from me, concerning the Means and Medium of this Wonderful Union, than the Philosophers have learnt in their Books, I must refer them for more ample Satisfaction and Information therein. For, as Norton saith:-

"Trust not therefore to Reading of one Book;  
But in many Authors' Works ye may look.  
Liber librum aperit, saith Arnold the great Clerk;  
Anaxagoras said the same for his Work,  
Who that slothful is in many Books to see,  
Such one in Practice, prompt shall never be."

The Reason he gives for thus Reading and Comparing many Books, is, that

"Every each of them taught but one point, or twain.  
Whereby his Fellows were made certain,  
How that he was to them a Brother,  
For every of them understood each other."

I have mentioned Norton the more, because it appears to me, that he and his Contemporary Ripley, have written very Learnedly of this Art, and wonderful Agreeingly, through both writ near the same time, and very probably one in England and the other abroad; and for ought I can meet with, were not known to one another at that time. Nor can one suppose that Norton had seen Ripley's 'Compound of Alchimy', since it was written but six years before his 'Ordinal'. Books of that kind especially, did not in those days come abroad quickly: Nor doth Norton, when he reckons up some that had written excellently of Proportion, take any notice of Ripley, who beyond all question hath in that excell'd.

This Harmony in Authors, that have written of the Art at the same time, and unknown one to another, a Modern Adept of the same Nation with the two before mentioned, has brought as a convincing Argument (among others) to prove its Being; and which, with me, has great Weight, and seems to serve his purpose.

This Author has profess'd to have outdone all that went before him, discovering such things, he says, as the World was barren enough before, yet his Disciples have much complain'd of their ill success; notwithstanding they have seemed to understand him more fully than the other Philosophers, insomuch that many have concluded his way of proceeding in this Art to be different from many of theirs. Nay, at length some have so ill rewarded his Candor, as to charge him with being ignorant of those things he so solemnly professeth to be true, and of which his Accusers are unworthy.

It seems he foresaw his Readers would thus misconstrue his Writings, and therefore he here and there scatters some necessary Cautions for those that would receive them.

"Nor let any expect," saith he, "Comfortable Doctrine in our Books, who know not the true Keys, by which our Matter is brought forth from Darkness into the Light. For verily tho' we write for the Inlightening a true Son of Art, yet also for the fatal Blinding of all such Owls and Bats, who cannot behold the Light of the Sun, nor can endure the Splendor of our Moon. To such we propound rare Tricks, suiting to their sordid Fancy: To the Covetous, an easie way without Expence: To the Hasty, Rash and Unstable, multiplicity of Distillations.

"In the World our Writings shall prove like a curious edged Knife; to some they shall carve out Dainties, to others they shall serve only to cut their Fingers. 'Tis the sign of an Owl, to be blinder, by how much the Sun shines brighter. - If thou wilt be heedless, thou may'st sooner stumble at our Books, than at any thou didst ever read in thy Life. Take this from one: that knows best the Sense of what he has written; where we speak most plainly, there be most circumspect, (for we do not go about to betray the Secrets

of Nature) especially in those places which seem to give Receipts so plain as you would desire, suspect either a Metaphor, or else be sure that something is suppressed which thou wilt hardly find (without Inspiration) of thyself; yet to a Son of Art, we have written that which never heretofore was by any reveal'd."

I might add many more Cautions of other Authors, as well as of this, concerning the Difficulties which attend the Reading of their Books; and had not mention'd what I have; but that it appear'd the more necessary to mention some of this Author's because almost every Body has taken up an Opinion, that he is more easily understood than the rest I but how profitably, themselves may judge.

We should not be just to ourselves, if we should be ignorant that when any of them have made a Discovery of this or the other Part of the Work, they have not Balanced it with such Obscurities which are not easily discerned; especially by the Unwary. And therefore if the Students in this Art, and particularly of this Author's Works, did believe the Philosophers had Cunning equal to their Skill and would but take the Advice given by them, they would not have room to Censure the Philosophers but themselves.

For what could anyone have said, more to have deter'd Inquirers from rash Conclusions, either in Theory or Practice, than this Author has done? viz., "Venture not," saith he, "to practice barely upon my Words: For know that what I have only hinted, is far more than what I have discover'd; and what I have declared to thy first Apprehension, most openly, hath yet its lurking Serpent under the green leaves; I mean some hidden thing, which thou oughtest to understand; which thou, being Cocksure at first Blush, wilt neglect."

The fond Notion which Men have entertained, of understanding this Author's Writing more perfectly or easier than the rest of the Masters is to me an Argument of his great skill in that peculiar way of Writing, which the hermetick Philosophers profess and value themselves upon, viz., to be able openly to show the Art to the Sons of it, and yet secure it from the unworthy.

That this is true, all their Writings shew; for some of them have learned the Art from Books as they own; which could not be, if it were not taught in them. These indeed are very few in comparison to those that Learn it not, though they read the same Books, but not the same things in them. As this Author hath again excellently described such men, viz., "Some I know will serve my Book, as they have served others; out of it they will read their own Phantastick Processes, which I never dreamt of, nor yet are they in Nature. Though we write in English, yet our Matter will be as hard as Greek to some, who will think they understand us well, when they misconstrue our Meaning most perversely. Nor is it imaginable, that they who are Fools in Nature, should be wise in our Books, which are Testimonies to Nature."

As this Author hath profess'd an extraordinary esteem for Ripley, and (in many things) has imitated his Candour, yet he has so manifestly compounded it with the Craft of Norton, that it is hard to distinguish them, and which well deserves the Cautions he hath given, and his Readers' Care therein.

He has in his Books led us some part of the way under such Philosophical Vails, as have been pretty easily seen through by most that read them with Application; who no sooner discover some of his Metaphors, but overcome with joy, and exalted with an Opinion of their own Abilities, presently cry out, we have found! we have found! And what have they found? Why their way into a Labyrinth.

For at the end of this short Walk, he hath set up one Metaphor, harder to be understood than all the rest, viz., The Doves of Diana. This stands at the Entrance into

a great Labyrinth, in which are abundance of Inquirers rambling at this day; many of them undiscerned by one another.

I have taken several Turns in it myself, wherein one shall meet with very few; for 'tis so large, and almost every one taking a different Path, that they seldom meet.

But finding it a very melancholy Place, I resolved to get out of it, and rather content myself to walk in the little Garden before the Entrance, wherein many things, tho' not all, were orderly to be seen. Choosing rather to stay there, and contemplate on the Metaphor set up, than venture again into the Wilderness; in which I heard the Noise and Voices of several strange and devouring Creatures, (some of which I had with difficulty escaped) every one, almost, having a differing Sound.

As this Author seems to have design'd a full stop at the Pillar he hath caused to be erected, and to prevent

Travellers running unawares into that dangerous and dark Wilderness, caused this Inscription to be put upon it, viz., "Learn what Diana's Doves are, which doth vanquish the Lion by asswaging him; I say, the green Lion, which is indeed the Babylonian Dragon, Killing all things with his poison. Then at length learn to know the Caducean Rod of Mercury, with which he works wonders;" etc. Therefore I will not step one Step farther without a Guide, for I dread going again into the Labyrinth. This guide must be a very wise Man, indued with singular Gifts; for he must not only tell me the Interpretation, but the Dream itself; and by this I may judge of his Ability. For, as Kelly saith, "Let no Man lead, unless he knows the Way."

Therefore let none mistake my Inquiring the Way, for a Teaching of it. If any do, and suffer by it, they must blame themselves, not me; for I am Inquiring, I say, not Teaching the Way. Masters cannot be deceived, but Searchers may.

We do not find this Enigma of Doves so frequently used as many others, and which also art very difficult to be understood. These figures, I conceive, spring from a Root of Knowledge and Learning, far above the Vulgar's Reach: For, is not this Art, saith one, Cabalistical, and full of Mysteries? So one of these Masters, well versed in Rabinical Learning, has told us what the name of a Dove doth signifie, as well as what it doth not, viz.:-

"The Name of a Dove is never apply'd to Metals themselves (which ought to be well observed by Inquirers, many having erred after this manner) but the ministering and preparing Natures. And that he that understands the Nature of the Burnt Offering (for Purification) will not take Turtles themselves, but two young Pigeons (which are the Off-spring) or Sons of the Dove."

And this Secret Pair he rather appropriates to Nogah (Venus) which is the Fifth amongst the Planets; so the Author of 'Arcanum Hermiticae' calls them the Birds of Venus. Tho' this Cabalist applies the name of Dove to Diana also.

In the 'History of Natural Things', saith he:-

"Luna is called the Medicine for the White; because she hath received a Whitening Splendor from the Sun, which, by a like shining, illustrates and converts into her own Nature all the Earth - that is the imperfect Metals: And that place of Isaiah xxx. 26, may be mystically understood of this, because the Work being finished, she hath got a Solar Splendor. But in that state, the place in Canticles vi., 9,25, belongs to her. But by the same Name the Matter of the Work is called; and so indeed, like to the Horned Moon, she is in the first State of Consistence; and like the full Moon in the last state of Fluidity and Purity."

In another Place he hath this Passage, speaking of two Birds, which place, I make no doubt, but the Author of Introit. Apert. had well considered, if not drawn his early Knowledge from, and of Argent vive, which he calls a Leopard, Water not wetting, and Jordan of the Wise Man, etc.

"And he shall have four Wings of a Bird upon his Back; the four Wings are of two Birds, which exasperate this Beast with their feathers, to the intent he may enter and fight the Lion and the Bear. And Power was given him over them, that he may overcome them, and extract their glutinous Blood. Of all these is made one Fourth Beast, which is frightful and terrible and very strong... Eating and breaking to pieces himself and others;...Treading the residue under his Feet."

This Guide I think may be depended upon, having given Demonstration of his Ability, by telling not only the Interpretation, but the Original figure itself.

More I have not met with in my Inquiry, therefore no more can be expected from me concerning this great Stumbling-block, at which so many fall into Error.

From these things 'tis very evident, to me, that this Art cannot be found by never so many casual Tryals, or Experiments, without a real Knowledge, as Sendivo has written, viz.: "Know for certain also, that this Art is not placed in Fortune, or casual Invention, but in real Science; and that there is but this one Matter in the World, by which, and of which, the Philosopher's Stone is made, viz., the Mercury of the Philosophers."

Out of what this is made, he teaches in his 'Treatise of Sulphur', as well as elsewhere. This is that Mercury, saith another, which the returning Sun diffuseth everywhere in the Month of March, or House of Aries; from whence also the Sulphur is to be sought. Which Sulphur, in this Work, saith Sendivo, is indeed instead of the Male; but the Mercury instead of the Female; of the Composition and Acting of these two, are generated the Mercuries of Philosophers. For as they have a double Sulphur, so they have a double Mercury, viz., For the White and for the Red: Which is but seldom, and then very cautiously hinted; and these Mercuries differ, both in Colour and Quality, as may be easily gathered from their Books, by careful Readers.

The Author of Intro. Apert. indeed hath taught, that there are two Mercuries to the White, used in two different Works; Asserting that the Acuation of the Mercury for Sol Vulgar, must differ from that of Philosophical Sol. And further, If (saith he) "you shall in your Decoction of Sol Vulgar, use the same Mercury which is used in our Sol (tho' both flow from the same Root in general) and apply that Regimen of Heat which the Wise Men in their Books have apply'd to our Stone, thou art without all doubt, in an Erroneous Way: And that is the great Labyrinth in which almost all young Practitioners are ensnared. For there is scarce one Philosopher, who in his Writings does not touch both ways."

In this, we may say of him, he hath not fallen short of any of them: For he has so interwoven one Work with another, one Regimen with another (by way of Balance, as I said before, for Discoveries) that little less than the Knowledge of all in Theory, will prevent our falling into constant Error, in some of these particulars; even after the Field in general is known: and which happened to himself as he confesses, and which I shall mention, as it falls in my Inquiry.

These (with many more) are the Difficulties which the Inquirers after this Art have to incounter with; and which, one would think, should rather deter, than encourage, many Men from pursuing it as they do: especially considering the adverse Fortune

that attends most Men, who prosecute this Study to their dying day; finishing their Lives in Ignorance and Despair. This Melancholy Prospect, I say, should leave such a deep Impression upon us, as to make us more cautiously meddle with this rare and difficult Philosophy; which without a Master or the special Favour of God, is never attain'd. As the Author of the 'New Light' informs us, viz., that unless God reveal it by a good Wit, or Friend, 'tis hardly known.

By the last most commonly, by the first most rarely. For as he adds, "Tho' Lully was a man of a subtile Wit, yet if he had not received the Art from Arnoldus, certainly he had been like those which find it with difficulty; and Amoldus also received it from a Friend: Every Art and Science is easie to a Master, but not to a Scholar."

Therefore this Art is easie to none, tho' of never so quick a Wit and Parts, but to those that know it only.

The Cabalist, I have before mentioned, hath lively prefigured, wise and good Men by Elisha; and the foolish Pretenders of this Art, by Gehazi, who was indeed Servant to Elisha; but to what purpose, the History of them, in the Second Book of Kings, sheweth.

Elisha an Example of Natural Wisdom, and a Despiser of Riches: He knew how to correct and make wholesome Poisonous Waters, and to multiply Treasure beyond the common Course of Nature: He could cure the worst Infirmities, nay, even raise the Dead: He knew how and when to blind and open the Eyes of Inquirers, also to punish Mockers, and even make Iron to swim; yea, his very Remains were efficacious after he was dead.

Gehazi labour'd in vain, and remain'd a Servant for ever; never qualified to be a Master, notwithstanding he had the Advantage of conversing with so great a one: He was Covetous, a Lyar and Deceiver; a Prattler, boasting of other Men's Deeds; Conceited and Hasty, thinking he sufficiently understood his Master, when he bids him take his Staff, and lay it upon the Dead Child, presently enterprising, though with an Heterogeneous Matter, and so able to effect nothing not discerning the Law of Nature; but Elisha apply'd a living Homogenous Agent, and then the Dead was raised. And instead of a double Portion of his Master's Knowledge (which Elisha desired and obtained by his Master Elijah) Gehazi got a Leprosie, as the Reward of his Doings. A great deal might be observed from this History of Elisha and Gehazi, who are Notable Examples of Wise and Good Men, and their Reverse, viz., Foolish and Profane; the last may talk, as Gehazi did, of procuring the supernatural Son of the Wise Man, but without being able to effect it; no more can his Successors, which are not a few even at this Day, who not only succeed him in Qualifications but Success. The Philosophers agree with one Voice, that one worthy of this Science must be strictly Virtuous, leading a holy Life, or God will not prosper him: He must have a competent Understanding, or he will not be able to conceive: He must be Diligent and Laborious, or he will not be able to work out what he conceives; and he must be private or he will not quietly enjoy that which he works out. To these must be added Patience and Leisure, together with a Competent Fortune; which is the more necessary in this Study, because it requires, as is already said the whole Man to find out the means, and then a careful Application is absolutely necessary to accomplish the Work.

The Philosophers, you very well know, take the liberty of seemingly contradicting themselves, and one another: Sometimes asserting the Work to be very easie; other times that 'tis very difficult or hard. One while, that 'tis short; then again that 'tis very tedious. Again, that 'tis done with little Expense, and an easie Labour; then complaining of the charge and Toil. Sometimes affirming their Matter to be but one

only thing, other times that 'tis compounded of several. One while the Work is to be done with a gentle Fire, another time that 'tis not perform'd without a strong. Then again, that 'tis equal, and of the same degree; and yet that 'tis daily increased. These are the Difficulties with many more that might be named which Inquirers lie under. And yet the Philosophers affirm, they all vanish when the Key of this Art is once attain'd, which is the Chalib's of Philosophers. No longer will a Tyro relish a false Writer, or be to seek to reconcile the true. For that as soon as the first Gate is opened, all the rest will fly open of themselves.

I fear many will be displeas'd and say, these difficulties are too well known to us already, we want rather to be told how we shall overcome 'em, than have them repeated to us. To these I answer, in the Philosopher's Words, Expound the Philosopher's Writings according to Nature and not to Fancy. Now they say, their stone is nothing else but Gold digested to the highest degree of purity and subtile Fixity. Many consent to this but will plead, that common Gold is not meant. In answer to which I shall add, let them read Sendivo on the Elements of Fire, The Way to Bliss, and others, and consider the Extensibility, Permanency and Purity of the Gold there spoken of. And also let them consider whether 'tis not such Gold they would produce by this Art, as is called common Gold. Then if it be common Gold you would produce, whether common Gold be not the Natural Body for such a Production; as common Man is of producing its own Kind; common Wheat, of Wheat; and so throughout whole Nature.

Common Wheat in a Barn, is as dead as common Gold in a chest; tho' both these have a Life, i.e., of Existence, and Power to increase their Kind; which Life must die, before the Power is brought to Action; and when this is done, they are properly called living Gold, and living Wheat, and not before.

Now, how comes Wheat to be so, we are pretty well appriz'd, viz., 'tis sown in its proper Vessel, the Earth; it is moistened with its proper Humidity and is digested by its proper Heat, and so it grows and increases.

And if we are to take Nature for our Example, Gold must be proceeded with after the same manner; tho' the Vessel, the Humidity and Heat differ, for a Metal and: for a Vegetable, yet both are liable to the Deficiencies and Excess of these things. For if Wheat hath not a Matrix duly qualified, or hath too much or too little Humidity, and so of Heat, it will succeed accordingly. And so must the other, if Nature be the same in the one as in the other, as no doubt she is; or to what purpose are we so often recommended to the Consideration of Nature. Sendivo bids us follow Nature; waving the many Subtilties of the Philosophers, written to amuse the Unskilful Inquirers. To conclude on this Head, if every Multiplication is from Seed; that the Perfection of every thing is its attaining a Seminal Virtue; and that nothing has this, which is imperfect of its Kind: Then it will follow, that if there be a Seminal Virtue in Metals, and that all of them are of the same Nature, the Seminal Virtue (that is the power of Multiplying) can be no where but in the most Perfect, which is Gold; vide 'Ars Metallica'.

As these things are consonant to Nature, Sound Reason and the Doctrine of Philosophers, even the most envious, I, for my part, shall make them my rule in my Inquiry: Others may do as they please,

And as the Author of the 'Way to Bliss' has not only told us (among many others) where the Seed of Gold lies, viz., in Gold; but how it lies, viz., This Seed of Gold is his whole Body loosened and softened in his own Water; there is all your stuff and Preparation. So he hath also, with the same Candor, shewed us the Water in which it dies, and with which 'tis raised. Where speaking of the Affinity that is known between

Gold and Quicksilver (in common Uses) which he calls the grand Mother of the Stone, and Spring of all her Goodness: Wherefore, says he, "When this fine and clean Body of Quicksilver is made, by Nature and Art, yet much finer and clearer, and again, as much more piercing and spiritual, and able to perform it; how much more readily will she run to her like, and devour it, the clean, fine and spiritual, that is the Quicksilvery part of the Metal. And if she do devour it, then it cannot be lost, but must needs go into a better Nature, even the Nature we desire."

This, he says, is done by the well-ordering the witty Fire of Hermes, "that here is all the Hardness, here all the World is blinded all the rest is easie. Search then this rare kind of Heat; for here is all the Cunning; this is the Key of all; this makes the Seeds and bringeth forth: Search wisely, and where it is, in the midst of Heaven and Earth for it is in the midst of both these places, and yet but one indeed; it is Earthy, yet Watery, Airy, and very Fiery, etc. He adds, Let the dew of this starry blood beat about the Womb, and your seed shall joy and prosper. Muse and conject well upon my Words, you that are fit and skilled in. Nature, for this is a very Natural Heat; and yet all the World is blinded. Nay indeed, if a Man would read little, and think much upon the ways of Nature, he might easilie hit this Art; and before that, never."

Thus the witty Author, according to the Custom of all Philosophers, brought as to a full stop, and left as to consider Nature, in order to remove the Remora that so often stops Inquirers in their career.

'Twas from the Excellency and Virtue of this Fire, no doubt, that the Cabalist I have before mentioned intituled his wonderful Book, 'Aesch Mezareph', or 'Purifying Fire'. This Fire has lain hid from many, a long time after they knew the Field in general, where the Seed was to be Sown. The fiery Furnace of Philosophers, says one of them, lay hid from me long; but after I Knew this, and how it was fitted to its proper Vessel, after a few days I beheld the admirable Brightness of our Water, which being seen, I could not but be amazed.

So Pontanus seems surprised at the wonderful Effects of this Fire, for want of the Knowledge of which he had erred so long and often; and tells us who inform'd him of it, viz., Artepheus, whose Book is extant, and read by most Inquirers, tho' not with the same success; some interpreting his Sayings one way, and some another; but few according to the true Sense and Meaning. Whence they have erred and will always err, unless they learn it better; the way to learn it, is but just told above, by the Author of 'The Way to Bliss', which agrees with the Way Pontanus prescribes, viz., They that should read Geber, and all other Philosophers, never so long, could not comprehend it, because that Fire is found by deep and profound Meditation only; and then it may be gather'd from Books, and not before.

We must not only have the Knowledge of this Fire; but, as we are often told, the true Measure of it to its Furnace; both which seem to be remote from the Eyes of the Vulgar: When this is known, the Difficulties that attend the Radical Dissolution of the close and fixed Body of Gold vanish. And before this can be done, this stout fixed Body must be Calcined, and reduced into as fine a Calx as possible, which is often hinted by Philosophers, but with a design to conceal it. Geber witnesses, that everything Calcined is of easier Solution, because the Parts of the Calcined Body, more subtilated by Fire, are more easily mixed with Water, and turned into Water. Without this previous Calcination, no Solution is found.

Therefore no wonder so many fail in their Attempts, to dissolve Gold in a Generative Way, by working on its Compact and Gross Body; For as the gross Bodies of Sol and Luna are not fit for Dissolution, but only their altered and unctuous Calxes; so Mercury, in its gross Body is not able to do this, but in its altered more subtile and

spiritual Nature; and drawn from its Vitriolick Caverns, acuated with its pure salt and piercing Sulphur, which then overcomes all things, even itself. For it not only dissolves Sol and Luna into its own Nature, but coagulates itself into theirs, true and fixed, by a proper Heat only.

Some may say, All these are so fully taught already, that a bare repeating of them is of no use.

That they are taught already, by the Masters of this Science themselves, is my warrant for repeating of 'em; and if you have already Learn'd these things, you have no Reason to be uneasie; if you have not, tis your advantage to be put in mind of them, even by an Inquirer.

Sad experience sheweth, that but very few of the past or present Searchers, learn those things which they often brag the Philosophers have taught: But at length to cover their own Ignorance, they fall into Arrogance, and blame the Philosophers for hiding of them; as is observed by (the never too much to be admired) Candid Ripley; who, in return, only modestly reproves them, Thus:-

"All Philosophers record and say the same;  
But simple Searchers putteth them in blame,  
Saying, they hide it; But they are Blameworthy,  
Who are no Clerks and meddle with Philosophy."

Here this good Man, in few words, justifies the true Philosophers, and lays the blame where it ought, viz. on the Unskilful Medlers with Philosophy.

What tho' he has conceal'd the Key of the Art under his green Lion, as others have done under the Doves, Chalibs, secret Fire, etc., some under one figure, some under another, which best answered their purpose, viz., Concealing the Art from the Unworthy. What they have done towards Discovering of it to the Deserving, merits the greatest Acknowledgements, not Censure from Inquirers to whom they declare they are not indebted.

Nor do I affirm, that all these different Terms are synonymous, that behoves the Inquirer to satisfy himself in, from their Writing, whether they are or can be deemed so.

I have ventur'd to call the Green Lion of Ripley the Key of the Work, because his Expositor has as good as called it so. "Learn then," says he, "to know this Green Lion, and its Preparation, which is all in all the Art; it's the only Knot; untye it, and you are as good as Master: For whatever then remains, is but to know the outward Regimen of the Fire, for to help on Nature's Internal Work."

And the same Author has expressly called the Chalibs so, viz., I will tell thee (if thou wilt conceive) it is called Chalibs, by the Author of the 'New Light'; and it is the true Principle of the Work, the true Key (as it may be handled) of unlocking the most hidden Secrets of Philosophers.

Again our Chalibs is the true Key of our work, without which the Fire of the Lamp could not be, by any Art, kindled. Which he further describes thus, viz., It is the Minera of Gold, a Spirit very pure, beyond others, etc.

Sendivogius calls this Matter, as well by the Name of Magnet, as Chalibs, viz., To speak more plainly, says he, 'tis our Magnet, which, in our foregoing Treatises, I called Chalibs, or Steel. The Air generates this Magnet, and the Magnet generates or makes out Air to appear and come forth: I have here intirely shewed thee the Truth. This Author has comprized in few Words what the Author of 'Intro. Apert.' has divided into Three Chapters, viz., Chalibs, Magnet, and Air; all which he has

Concentrated in a Fourth, viz., Chaos; The Earth, says he, is a heavy Body, the Matrix of Minerals, because it keeps them occultly in itself; altho' it brings to light Trees and animals. The Heaven is that wherein the great Lights, together with the Stars, are rowled about; and it sends down its Virtues through the Air into inferior things. When he has gone thus far, he, in Imitation of Sendivogius's Skill and Candor, adds, But in the Beginning, all being confounded together, made a Chaos. Behold ! I have faithfully opened to you the Truth; for our Chaos, etc. O the Harmony and Skill, as well as Candor of these two great Masters! Beg of God that he would make you Discerners and Partakers of these things. Nor let me forget most candid Ripley, who exactly corresponds with these, viz.:

"For as of one Mass was made all thing  
Right; so must in our Practice be.  
In Philosophers Books therefore, who lifts to see,  
Our Stone is called the less World One and Three:  
Magnesia also of Sulphur, and Mercury,  
Proportionate by Nature most perfectly."

Thus we see Ripley's One Mass, Philalethes's Chaos, and Sendivogius's Matter of the Antient Philosophers, are the same; containing Three, viz., Magnet, Chalibs, Air, or Magnesia, Sulphur and Mercury: which also are called by abundance of other Names in Philosophers' Books, e.g., Artephius speaking of the Compound, Magnesia, says, That 'tis compounded, like a Man of Body, Soul and Spirit; which he thus expounds, viz.,

"For the Body is the fixed Earth of the Sun, which is more than most fine, ponderously lifted up by the force of our Divine Water: The Soul is the Tincture of the Sun and Moon, proceeding from the Conjunction or Communication of these two: But the Spirit is the Mineral Virtue of the Two Bodies and the Water, which carries the Soul, etc. Again, the Spirit therefore pierceth, the Body fixeth, the Soul coupleth, coloureth and whiteneth. Of these three united together, is our Stone made; that is, of the Sun, and Moon, and Mercury. Flammel says he could easily give very clear Comparisons and Expositions of this Body, Soul and Spirit: But then he must of necessity speak things which God reserves to reveal unto them that fear and love him, and consequently ought not to be written";

yet he is not wanting to concur with Artephius, in calling them the Sun, Moon and Mercury, and agreeing exactly with him in his Exposition. It would be as it were endless, and indeed needless, to recite all the different Expressions used by Philosophers, who confirm and constantly maintain this Doctrine of Trinity in Unity, under various Modes of Speech, and hard-to-be-understood Similes. But to keep a little to that of the Green Lion, which is worth our Enquiry: Ripley speaking of its Blood, asserts this Secret to be hid by all Philosophers, viz.:

"The said Menstrual is (I say to thee in counsel)  
The Blood of our Green Lion, and not of Vitriol:  
Dame Venus can the Truth of this thee tell  
At the beginning, to Counsel if thou her call.  
This Secret is hid by Philosophers great and small.

Which blood drawn out of the Green Lion,  
For lack of Heat, had not perfect Digestion."

So the Author of 'Arcanum Hermeticae' saith, the most precious Substance is Venus, the Hermaphrodite of the Antients, glorious (or powerful) in both Sexes. The Author of 'Aesch Mezareph', speaking of Venus, under the Names Nogah and Hod, which is a necessary Instrument to promote the Metallick Splendor, says, It has more a part of a Male, than Female; and speaking of the Green Lion, he saith, Which, I pray thee, do not think is called so from any other Cause but its Colour: For unless thy Matter shall be green, not only in that immediate State before 'tis reduced into Water, but also after the Water of Gold is made of it. Why 'tis called a Lion, is hinted by another, viz., Having Power to overcome, and reduce Bodies to their first Matter, and to make fixed things volatile and spiritual; whence 'tis fitly called a Lion. Some are who derive the Name Green from the Rawness or Unripeness of the Subject, and not from the Colour, viz.:-

"Whose Colour doubtless is not so,  
And that your Wisdom do well know;  
But our Lion wanting Maturity,  
Is called Green, from Unripeness, trust me."  
- The Hunting of the Green Lion.

Another says:-

" For it is because of its transcendent Force  
It hath, and for the Rawness of its Source,  
Of which the liice is no where to be seen,  
That it of them is named their Lion green.  
Our subject is no ways malleable;  
It is metalline, and its Colour sable."  
- Sophic Feast.

These are some more of the seeming Contradictions, which Philosophers warn us not to be deceived with, but to learn to Reconcile. These Difficulties are to be overcome by Meditation only.

Now, let us try whether, or how far, 'tis possible to Reconcile these Contradictions concerning the Green Lion. The Cabalist (much admired by me) says, the Matter is actually green, both before 'tis dissolved and afterwards also: This doth not deny, but confirm, that 'tis Spoke of, and considered, in divers States; and then it may not be absurd to suppose, that it may be, and is, described by one in one state and degree of Perfection, and by others in another: By one in its Impurity; by another in its Passage from thence to its Purity (for Ripley says 'tis unclean); and by a third when 'tis Purified. For as Matters, when more or less pure or mature, are of a different Texture, so they also differ in Colour. And 'tis in this Sense, I make no doubt the Philosophers are to be understood not only with relation to this Subject, but 'Tis not therefore every Matter which is foul or, green (as vitriol is, which Ripley says, Fools take to be their Green Lion) that intitles it to this wonderful Name; no, but it must have all the other Virtues and Powers in it, that are assigned by Philosophers: Which thing lies very obscure, and seemingly base, but it is, in its Purity and exalted Virtue, their Subject of Wonders. To Produce which, this fond Minera, they tell us, must be dissolved and

exactly purified, in a pure Homogeneous Water, which is its own Blood, as White as Milk; which Name some have rather imposed. This Leprous Body, Sendivo and others have called Saturn, and Saturn's Child and what some have called flood and Milk, he calls Urine.

Thus the Masters of this Science take the liberty to express themselves by different Similes, in order to disguise their Secret, which a mental man will discover and improve by, as soon as he shall discern any one of their Intentions; the rest follow in course, tho' varied ever so many ways, as they themselves testify.

What some have called Blood, Wine, etc., the Author of the Learned 'Sophic Feast' calls fiery Water, etc., viz.:

"Their Lion green they suffer'd him to prey  
On Cadmus Sociates; and when the Fray  
Was over, they with Dian's charms him ty'd  
And made him under Waters to abide,  
And washed him clean; and after gave him Wings  
To fly, much like a Dragon, whose sharp springs  
Of fiery Water, the only way was found  
To cause Apollo his Harp-strings to sound.  
This is the true Nymph's Bath, which we did try,  
And proved to be the Wise Men's Mercury."

Here all Doubts and Difficulties end, when this is attain'd; so with it I shall finish this Inquiry: Having shewed my Fellow Inquirers, in what manner I have been enchain'd in it; concluding in the Words of the aforesaid Author, viz.:

"Happy are they, who shall not miss to find  
The new uprising Sun:  
More happy they, who, with renewed Mind,  
In God find Rest alone."

---

**A SHORT TRACT,**  
**OR**  
**PHILOSOPHICAL SUMMARY**

by **NICHOLAS FLAMELL**

HE that would understand the whole subject of metals, and how they are transmuted one into another, ought first to find an answer to the question, from what substance they spring, and how they are formed in their ores. For this purpose he must observe the changes that are continually going forward in the mineral veins of the earth. Hence they may be made subject to transmutation outside of their ores if they are first made spiritual, so that they may be reduced to their sulphur and mercury, which is performed by Nature. Now all metals have been formed out of sulphur and quicksilver, which are the seeds of all metals, the one representing the male, and the other the female principle. These two varieties of seed are, of course, composed of elementary substances; the sulphur, or male seed, being nothing but fire and air (*i.e.*; *good* sulphur, resembling fire, free from the mutable properties of metals, and not that common sulphur which is not a metallic substance at all); while the quicksilver, or female seed, is nothing but earth and water. These two seeds were figuratively represented by the ancient Sages under the forms of two dragons, or serpents, one of which had wings, while the other had none. The wingless dragon is sulphur, because it never flies away from the fire. The winged serpent is quicksilver, which is borne away through the air (the female seed, which is composed of water and earth)—because in a certain degree it flies away or evaporates. Now, if these two seeds, separated one from another, are united spermatically by triumphant Nature, in the book of Mercury, the first mother of metals, the Sages call the substance that results, the flying dragon, because this dragon, being kindled with its fire, in its flight pours abroad into the air fire and a poisonous vapour. The same happens to mercury, which, if placed in a vessel over an ordinary fire, has its internal, hidden fire kindled; and then you may see how the outward vegetable fire kindles the inward natural fire of mercury. You will notice that it exhales into the air a certain poisonous fume or vapour, the stench of which is such as to prove that it is nothing but the head of the dragon which is leaving Babylon in great haste, even the philosophical Babylon which is encompassed by a double or treble vessel.

Other Sages have likened this Mercury to a flying Lion, because the Lion devours other animals, and refreshes and strengthens himself at will with the blood of all animals except those which have power to resist his rage—and because mercury, too, is known to deprive other metals of their specific form, and to absorb and incorporate them. Gold and silver, however, are strong enough to resist its violence; although it is well-known that mercury, when exposed to an exceptional degree of heat, devours and swallows even these two metals. Yet neither of them is changed into the nature of the mercury, howbeit, they are enclosed in its womb; for gold and silver are more permanent and more perfect than crude mercury, this being an imperfect metal, notwithstanding that there is in it the substance of perfection. Common gold, which is a perfect metal, and silver, and all the imperfect metals, are developed out of mercury. For this reason, the ancient Sages have called it the Mother of the Metals, and hence, being itself a metal, it must contain a two-fold metallic substance, namely, the inner substance of the Moon, and that of the Sun (which is unlike the other). Of these two substances mercury is formed, and they are cherished in its body in the form of

spiritual essences. Now, as soon as Nature has formed that mercury of these two spirits, she strives to transmute them into a perfect bodily form; and therefore, when those two spirits have grown up, and their two varieties of seed awake, they desire to assume their own proper bodies; and then the Mother, mercury, must die, and having died a natural death, can never be quickened any more into that which it was previously.

Vainglorious and arrogant Alchemists have obscurely hinted that perfect and imperfect bodies must be transmuted into fluid mercury, but this assertion is only a trap for the unwary. It is true that mercury consumes imperfect metals, like lead and tin, and thus increases in quantity; but, by doing so, it loses its perfection, and is no longer the mercury that it was before. If, indeed, it could be so mortified by a chemical process as to shut out all hope of its ever quickening itself again, it would be changed into something else, as happens with cinnabar, or in sublimate. But, when it is coagulated by a chemical process, whether by a swift or a slow method, its two bodies do not assume a permanent form. By the natural process this coagulation is indeed successfully carried out; and thus we never find a vein of lead, for instance, which does not contain a few permanent grains, at least, of gold and silver. The first coagulation of mercury is lead, which is most suitable for fixing it, and bringing it to perfection. For lead is never without some fixed grain of gold and silver, which are imparted to it by Nature for the purpose of multiplication and development, as I myself have experienced, and am able to testify. So long as it is in its mercury, and not separated from its mineral, it can continue to increase its substance from the substance of its mercury. But if this fixed grain is taken away, and severed from its mercury (or the mineral in which it is found), it can no longer gain in size. It is with this grain as with the green fruit that is formed on a tree when the blossom has been shed. If it is plucked off before it is ripe, it can come to nothing. If it is left on the tree, it is nourished and increased by the sap and the juice of the parent stem, and thus gradually attains to its proper size, and to maturity. But, until ripeness has been attained, the fruit continues to attract to itself the sap and juice of the tree, that is to say, so long as the connection with the parent tree is not severed.

Almost the same thing happens with gold. Such a grain attracts to itself the mercury of the lead, and incessantly "fixes" it into its own mercury, whereby it grows and gradually increases in size. The mercury of perfect or imperfect metals is the parent tree, and the grain (of gold) can be nourished with nothing but this mercury. But as soon as you sever the connection with the parent mercury, that growth of the grain must immediately come to an end; it is as though the unripe fruit had been plucked from the tree: you would vainly endeavour to restore the vital connexion. When you have once removed an unripe pear or apple from its native branch, it would be foolish indeed to join it to the tree once more, and expect it to ripen. Instead of growing, it will gradually shrivel up, and become smaller. The same thing may be observed in the case of the metals. For if any one were to take common metallic gold and silver, and tried to resolve those metals into mercury, he would be doing a very foolish thing. It is a result which cannot be brought about by any chemical process, however subtle and ingenious, just as fruit which has once been plucked in an unripe state can never again be vitally joined to the parent tree. It has, indeed, been well said by the Sages that if gold and silver be joined together through their proper mercury, they have power to render all other (imperfect) metals perfect. But these Sages did not speak of common gold and silver, which must always remain what they are, can never become anything else, and certainly cannot aid the development of other metals. It is fruit that has been plucked before the time, and therefore is dead and withered. No, the *living* fruit (the real living gold and silver) we must seek *on the tree*; for only there can it grow, and increase in size, according to the possibilities of its nature. This tree we must transplant, without gathering its fruit, into a better and richer soil, and to a sunnier spot. Then its fruit will receive more nourishment in a single day than it was wont to receive in a hundred years, while it was still in its former sterile soil.

I wish you to understand that Mercury, which is a most excellent tree, and contains silver and gold in an indissoluble form, must be taken and transplanted into a soil that is nearer to the Sun (*i.e.*, in this case, gold), where it may flourish exceedingly, and be abundantly watered. Where it was planted before, it was so shaken and weakened by the wind and the frost, that but little fruit could be expected from it. So there it remained a long time, and bore no fruit.

But in the garden of the Sages, the *Sun* sheds its genial influence both morning and evening, day and night, unceasingly. There our *tree* is watered with the rarest dew, and the fruit which hangs upon the trees swells and ripens and expands, from day to day. It never withers, but makes more progress in one year than it did in a thousand years in its former sterile situation. Or, to drop metaphor, let the mercury be taken, and warmed day and night in an alembic over a gentle fire. Yet it should not be a coal or a wood fire, but a clear and pellucid heat, like that of the *Sun* itself—a gentle and even warmth. Growing fruit must not be exposed to too much heat, or else it is withered, and shrivelled up, and is never brought to perfection. It must have a genial warmth, and be supported by a moderate moisture in the tree, if it is to flourish and expand. For heat and moisture are the food of all earthly things, both animal, vegetable, and mineral. Ordinary coal or wood fires are too violent for our purpose, and give no nourishment like the heat of the Sun which preserves all bodies through its natural influences. For this reason the Sages use none but this natural fire, not because it is made by the Sages, but because it is made by Nature—Nature, that creates all things, whether they be animal, vegetable, or mineral, and warms them, each at its own proper degree.

Therefore, I will not say that man by his art can make natural things; but I do say that human art can impart greater perfection to that which Nature makes. For this purpose the ancient Sages have had but one object in view, namely, to produce from the moon and the true mother mercury, the mercury of the philosophers, which in its operation is much more potent than natural mercury, and is useful for working upon simple, perfect, imperfect, cold, and warm metals. Now, the Philosophical Stone is good for perfect and imperfect metals, and soon restores and brings them to perfection without any diminution, addition, or real change of any kind. For, apart from perfecting them, it leaves them in the state in which they were before. I do not say that the Sages combine common gold, silver, and mercury for this purpose: this is the method only of ignorant charlatans, who thereby hope to prepare the mercury of the Sages; but they never succeed in producing this, the real first substance of the Stone. If they would obtain it they must go to the seventh mountain, where there is no plain, and from its height they must look down upon the sixth, which they will behold at a great distance. On the summit of that mountain they will find the glorious Regal Herb, which some Sages call a mineral, some a vegetable. The bones they must leave, and only extract its pure juice, which will enable them to do the better part of the work. This is the true and subtle mercury of the philosophers which you must take. Now, first it prepares the white tincture, and then the red. For the Sun and Moon are prepared by the same method, and yield the red and white tincture, respectively, and the preparation is so simple that it might be seen to by a woman while she works at her spindle—just as she might set a hen on some eggs, without washing them first, and without any other trouble but that of turning the eggs every day that the chickens may break the shells all the sooner. In like manner, you must not wash your mercury, but only put it with its like (which is fire) into ashes (corresponding to the straw), into one glass vessel (which is the nest), in a suitable alembic (which is the house). If you do this there will come out a chicken, that will deliver you with its blood from all diseases, and feed you with its flesh, and clothe you with its feathers, and shelter you from the cold. Therefore, I pray and beseech the Creator of all things to grant His grace to all faithful Alchemists, that they may find the chicken, which, through God's unspeakable goodness and mercy, has now been vouchsafed to me. I have written this tract for your sakes, to encourage

you, and point out to you the right way: I hope and trust that my words will enable you to understand more fully the works of other Sages. Farewell!

**A SUBTLE ALLEGORY  
CONCERNING THE SECRETS OF ALCHEMY  
VERY USEFUL TO POSSESS AND PLEASANT TO READ**

**BY  
MICHAEL MAIER**

AFTER spending the best part of my life in the study of the liberal arts and sciences, and in the company of wise men and judicious scholars, I was compelled, as the result of my observation of mankind, to arrive at the melancholy conclusion that the hearts of most persons are set either on ambitious and vainglorious projects, on sensual pleasures, or on the accumulation of wealth by all and any means; and that few care either for God or for virtue. At first I did not quite know whether to become a disciple of the laughing or of the weeping philosopher, or whether to join in the exclamation of the wise Prince of Israel: "All things are vanity." But at length the Bible and experience taught me to take refuge in the study of the hidden secrets of Nature, whether pursued at home, by means of books, or abroad, in the Great Volume of the World. Now, the more I drank of the mighty fount of knowledge, the more painfully my thirst, like that of Tantalus, seemed to increase. I had heard that there was a bird called Phœnix, the only one of its kind in the whole world, whose feathers and flesh constitute the great and glorious medicine for all passion, pain, and sorrow; which also Helena, after her return from Troy, had presented in the form of a draught to Telemachus, who thereupon had forgotten all his sorrows and troubles. This bird I could not indeed hope to obtain entire; but I was seized with an irresistible longing to become possessed of at least one of its smallest feathers; and for this unspeakable privilege I was prepared to spend all my substance, to travel far and wide, and to endure every hardship. There was, of course, much to discourage me. Some people denied the very existence of this bird; others laughed at my faith in its wonder-working properties. I was thus brought for a time to regard all that Tacitus, Pliny, and all other writers have said as fabulous, and to doubt whether, after all, the different narcotics and opiates were not a better remedy for anger and sorrow than the supposed virtues of the Phœnix. Moreover, I had heard of the simple method of curing these mental ailments suggested by a certain wise man to Augustus, whom he bade run through the twenty-four letters before saying anything whenever he was angry; and this suggestion appeared to supersede all other remedies. I had also read the books of those moral philosophers who undertake to prescribe an effective remedy for every disease of the mind. But after giving all these boasted specifics a fair trial, I found, to my dismay, that they were of little practical use. In many cases, the causes of mental maladies appeared to be material, and to consist in an excess or defect of the bile, or of some other bodily substance; in all these cases a medical treatment seemed to be indicated; whence Galen, that prince among physicians, was led to believe that character depends on temperaments of the body. As a soldier may lose all his bravery and strength by being starved and confined in a close prison, so even a good person may yield to anger, simply through some vicious habit of body. This opinion is most reasonable in itself, and is borne out, amongst other things, by the testimony which is given by Arnold of Villanova, in that book of his where he sets forth the virtues of all medicines by means of tables of the four qualities: "The medicines that conduce to intellectual excellence are those which strengthen the digestion, and nourish the brain and the principal vitals, purging out all superfluities, purifying the blood, and preventing the ascent of vapours to the brain; hence you will find that many medical writers speak of their medicines as productive of a direct effect upon the mind, when it is only through the medium of the stomach, the brain, the blood, the liver, etc., that they tend to brighten the intellectual faculties, by improving the general health of the brain, and quickening all processes of the body, that you may say they are productive of joy, because they tend to strengthen the chief limbs, purify the

blood, and produce good animal spirits. Other medicines "lead to Paradise," as they dispose the heart to charity and to every good work. by their action upon the blood. Some medicinal herbs have the power of exciting love, by increasing and clarifying the blood, and thus quickening the sexual instinct; while others make men chaste and religious, by inducing poverty and frigidity of blood, and taking away the edge of all sensual appetite. In the same way, it is possible, by means of certain drugs, to make men stupid and insane, as men are rendered dull and stolid by drinking too much wine. You may also notice, sometimes, that after eating a certain kind of food, men become light-hearted, joyous, and inclined to dance and sing—though they are ordinarily staid and grave persons—while other kinds of food have a contrary effect upon them. Thus, a physician has power to make a miser liberal, a chaste person lascivious, a timid person bold, simply by changing the complexion of his vital juices. Such are the wonderful secrets of the medical Art, though, of course, they are hidden from the foolish and the ignorant. There are a great many infatuated persons who will not believe that medicine can do anything but cure a headache; but such people know little of the resources of this science. Hippocrates forbid the physicians whom he taught to reveal these secrets; and it was a wise prohibition." A little further on the same writer says: "What medicine can produce greater heat than anger? or chill the body more than fear? or invigorate the nerves more thoroughly than joy? or nourish and comfort more gently than hope? And what more certain cause of death is there than despair?" These are the words of the philosopher, and they shew that medicine may, through the body, cure the mind, and thus supply a remedy for anger as well as other mental disturbances. It is true that if there is a remedy for anger, it would, in the present state of the world, hardly be very highly esteemed. Still it would calm the passions of individuals, although other persons might not recognise its value. But that which men do not care to have just now, may one day be in great demand. Such is the vicissitude of all things human. Galen once said that the savages of England and Germany were as hostile to the science of Medicine as they were ignorant of it. But now the descendants of Galen's countrymen are sunk in barbarism, while the English and Germans are the most skilful physicians in the world. Thus it seems very likely that this Remedy may be one day in great request, especially when we consider its vast utility, and the innumerable evils which anger brings upon men.

What has been said about anger applies with equal force to grief; for while the symptoms of anger are more or less mental, those of grief produce a more perceptible and lasting effect on the body. This great Remedy for anger and grief, then, it would be most desirable to have, if we could only find the Phœnix which affords it, Where shall I look for it? Where shall I enquire after it? Whom shall I ask? I determined to go abroad, and to search for it till I should have found it. Fortune assists the brave: to the indolent and idle knowledge never comes. I would leave my native country—dearly as I love it, and sadly as I should miss my friends—and wander from land to land until I should be able to return with the eagerly coveted Medicine. All beginnings are difficult: he who has never been sad, cannot rejoice; he who has never erred, cannot be brought back to the right way; and as the Chemists say: "There is in Alchemy a certain noble body, which is moved from master to master, whose beginning is misery and sourness, whose end is sweetness and joy." So I expected to endure hardships, and go through bitter experiences, but I also expected them to be crowned with the delights of success. Of the existence of the Phœnix I had no doubt, or I could not have looked for it. It is enough for me to see the Sun and its rays, even though I cannot touch it; and perhaps it is as well for us that we cannot get so very close to the Sun. But as to this Medicine which I seek; how can I have a perfect knowledge of it before I see and touch it? How can I become a Master before I have been a scholar? The products of all countries are not the same; and perhaps I may learn in one part of the world what I cannot get to know in another. Moreover, I asked myself the question: Can a pilgrim's life hurt any one? Are we not all pilgrims here below to that land whither our Saviour Christ has gone before? And is not the example of peregrination set us by the swallow, the herald of spring; by the

crane, the stork, and other birds of passage? Does not the whole world lie open before man as the air is everywhere accessible to birds? Great Phoebus himself, the god of the Sun, journeys day by day over the wide expanse of the sky. The heart of man beats and pulsates in his bosom from the first to the last hour of his life; and being surrounded by all these models and examples, it is natural for man to lead the life of a pilgrim, particularly if that pilgrimage be directed towards a certain goal. The merchant travels over land and sea to buy the produce of distant climes; but a nobler merchandise by far are science and knowledge, which are the wares of the mind. He who stays at home will there bury his talents, and get to know little about the secrets of the universe. Moreover, it is both pleasant to travel and honourable to be always several hours' journey in advance of the Sun. That which is most spiritual is most swift in its movements, while the lifeless earth alone is immovable. The other three elements are in perpetual motion: the air sweeps over the earth in the shape of winds, hurricanes, and gales; fire devours everything before it as it rushes onward in the conflagration of a great city; water runs along in rivers and mighty streams, and hastes to reach the sea. Let us also look up and behold the heavens as they move in their glory. The stars, the sun, and the moon know the times and seasons of their rising and setting. A cannon ball, if projected from one of our most powerful guns, would be more than eight days in making the compass of the world (which is more than 25,000 miles); but the Sun, notwithstanding its vast size, accomplishes the same distance in 24 hours. It would make our thoughts reel if we strove to realise the velocity with which Saturn moves round the Sun, and with which the heavens revolve round their own axis. But greater still, and far more wonderful, is the speed of human thought, which, in a moment of time, travels from one end of the heavens to the other. We may believe that the angels, as spiritual beings, move with the quickness of that which is spiritual in man, viz., thought. God alone does not move; for He is everywhere. For all these reasons, I conceived that it would be both interesting, pleasant, honourable, and eminently profitable for me to follow the example of the whole world, and to undertake a pilgrimage for the purpose of discovering this wonderful bird Phoenix. I therefore braced myself for a long journey, determining to travel, first, through all the countries of Europe, then, if necessary, to America, thence to Asia, and at last to pass on to Africa. If, after carefully searching for the Phoenix in all these parts of the world, I did not succeed in finding it or hearing of it, I might reasonably give up all hopes of ever setting eyes thereon. The plan of my journey was determined by the relative quality of the elements which the different parts of the world represent, *i.e.*, Europe stands for earth, America for water, Asia for air, and Africa for fire; and earth cannot become air except through the medium of water; nor can water become fire except through the medium of air. I determined, then, to go first to Europe, which represents the grossest, and last to Africa, which represents the most subtle element. But my reasons will be set forth more clearly as I come to speak of the different parts of the world.

### **EUROPE: EARTH.**

I left my native town on the day of the vernal equinox, when the Moon and Sun were both in the sign of Aries, with the intention of first travelling through Europe, and to enquire everywhere after the Phoenix. I took Europe to represent the element Earth, because earth forms the foundation of all the other elements, and stands out above the water, so Europe is the mother of the whole world, and though smaller than other continents, is vastly superior to them through the courage, energy, and mental strength of its inhabitants. Some say that one handful of earth gives ten handfuls of water, a hundred handfuls of air, and a thousand handfuls of fire; and this is the relative importance of the different continents, if Europe answers to earth. Europe has produced the bravest warriors, and the most distinguished conquerors; and though she has subdued other continents, she has herself never been subjugated by them. Of the four great world empires, only one was founded by an Asiatic prince; the Macedonian, the Roman, and the Teutonic Empires, have

all had their centres in Europe. Alexander the Great and Julius Cæsar were among her sons. If we look at a map of Europe we may easily perceive that in shape this part of the world resembles a virgin; but her heart is that of a lion. For these reasons, I determined to travel first through this Virgin Lion, because it clearly corresponds to the fundamental element: earth.

Europe is a Virgin because of her beauty and spotless purity; a Lion because she has conquered others, but has never herself been conquered. Among the heavenly bodies the Sun answers to Europe, and among the metals, gold. For though she produces little gold, and the sun shines upon her with less fierceness than on Africa, yet she is worthy of being compared to the Sun and gold because of the excellence of her people, though a few years ago even some real lions were born in Germany, yet we call her a Lioness only on account of her stoutness of heart. Europe is the Mother of the World, and Germany is her heart.

Nor is Europe without her marvels. In Pannonia, it is reported, men live in compact stone houses under water. The hot springs of Carlsbad, it is said, are hardened into stones. On the coasts of Prussia, a transparent and pellucid stone (amber), formed out of subterraneous vegetable juices, is cast ashore in large quantities. I do not mention the coral of the Sicilian sea, which, originally a plant, hardens outside water into a white or red tree of stone; or the sealed earth of Germany and Silesia. . . . Europe, then, is the *Lion Earth*. This expression is for those who hear not with their ears only, but also with their brains; it is earth which resists the fire, like gold, and is not resolved into air. Like the boundary pillar of the gods of old, it "yields to none." Hence Europe (the gold of the universe) seemed the very place in which I should be most likely to hear of the Phœnix and its Medicine. But most of those whom I met laughed at my quest, and said that, like Narcissus, I had fallen in love with the shadow of my own mind, the echo of my vain and ambitious thoughts, which had no substantial existence apart from my own folly. "The words of the Alchemists," said they, "are like clouds: they may mean and represent anything, according to the fancy of him who hears them. And even if there were such a medicine, human life is too brief for the search; all that makes life worth living will have to be neglected and thrust aside while you are engaged in hunting after it. If we can pick up a knowledge of this secret casually, and whilst devoting ourselves to other pursuits, well; but if not, we can very ill spare the time for a closer search." These objections (at least the latter half of them) I met as follows: "The quest of this Medicine demands the whole powers of a man's body and mind. He who engages in it only casually, cannot hope to penetrate even the outward rind of knowledge. The object of our search is a profound secret, and a man who is not prepared to give himself wholly to this enquiry had much better abstain from it altogether. I readily acknowledge that the powers of my mind are not such as to justify me in anticipating success. But the spirit within me impels me to undertake this search; and I am confident that God will at the last reward my patience, and my humble waiting upon Him. As every King loves his Queen, as every bridegroom is devoted to his bride, so I regard this science as more beautiful and lovely than anything else in the world besides. Now, beautiful things are hard to win, and hard toil is the way to all that is great and glorious." This was the gist of my answer. Now I had already travelled through a great part of Europe, when it occurred to me that Italy and Spain are constantly mentioned by the Ancients as the great seats of secret knowledge, and I therefore directed my steps thitherward. In Spain I heard that some Arabs (Geber, Avicenna, and others) had lived there a long time ago, and these had possessed the wonderful Medicine; I was also told a great deal about Hercules and his achievement in securing the golden apples of the Hesperides, and also the golden cup, wherein he received the medicine for anger and sorrow. Now all prudent men have decided that it contained a small portion of the feathers of the Phœnix. I saw that Geryon with the three bodies was the theme of the philosopher's writings, that Hercules was a laborious artist, seeker of the Medicine. But nobody was able to give me any definite information. I did not, however, wish to leave Europe without visiting the Canary Islands, which are seven in number and are named:

Lancerotta, Bonaventura, Great Canaria, Teneriffe, Gomera, Ferro, and Palma. Three of them, Lancerotta, Gomera, and Ferro, are governed each by its own King. Ferro is naturally destitute of good drinking water, but the inhabitants get a supply of it out of certain broad-leaved trees, which distil sweet water in such quantities as to suffice for the whole island. Strangers and pirates who land in the island, being ignorant of this fact, are prevented by want of water from staying in Ferro very long. Now, it happened about this time that the King of Gomera had died without leaving a male heir, and his subjects refused to acknowledge the authority of his beautiful daughter Blanche, unless she accepted the hand of some royal wooer, because they said that it was unworthy of men to be ruled by a woman, and calculated to injure the manliness of the national character—as was shewn by the experience of those peoples over whom women have borne sway for any length of time. For there women had assumed the place of men, while men were degraded to the position of women; and, as a consequence, there followed the wildest excesses of profligacy and lewdness. So the royal maiden was prevailed upon to think of bestowing her hand in marriage. Now, there was in the island a royal youth, named Brumazar (with beautiful dark locks and a splendid golden robe), who was passionately enamoured of the royal maiden Blanche, and was loved by her in return. He wooed and won her, and the wedding was celebrated on condition that she should bring to him as her dower a diamond of great value and magnitude, while he should present to her a splendid ruby of incalculable worth (*i.e.*, worth a million ducats); he, as her King and Lord, should protect her from all dangers and from the robbers with whom that country swarms, while she, on the other hand, promised humbly to obey him without either subterfuge or tergiversation. After these preliminaries, they were linked together in close and indissoluble marriage, in which they lived long and happily; and it was predicted that a son should be born to them, who would be a mighty conqueror, and would carry his victorious arms as far as the Pillars of Dionysus in India. . . . So you see that I was unable to get any information whatsoever about the Phoenix in the course of my wanderings through Europe; I therefore determined to set sail for America, in the hope that I might be more fortunate among the savages of that Continent. For I remembered the words of the poet:—

"Accident is a mighty helper; let your hook always be baited; in the least likely river you may catch your fish."

### **AMERICA: WATER.**

In these days, when commerce has opened up, as it were, a highroad across the seas to America (or India in the West), there is no very great difficulty in reaching that continent; but far different were the circumstances under which it was first discovered. After leaving the "Islands of the Blessed," I became a passenger on board of a ship which had an eagle for its figurehead; and, after weathering many severe gales and hurricanes, we at length landed in Brazil, a great province of America, entirely covered with forests. The surface of the country is only dotted here and there with the homestead of a settler; there are few towns, and the inhabitants are sunk in ignorance, and unskilled in the arts of civilisation. How, then, could I hope to hear anything about the Phoenix among people who could hardly read or write? Yet there are in this country many rare and beautiful birds which are not found elsewhere, though, of course, the Phoenix, being a miraculous bird, must not be sought among common fowls. The trees of the land are of a rich colour and sweet fragrance; and one day when I was enjoying the wild beauty of the forest, and listening to the natural music of the birds, I happened to find an apple of unusual and exquisite beauty, which on a closer view exhibited the following inscription:—

"Within is that which, if you deliver it to its grandmother, there will thence arise a son who may cling to his mother in loving embrace. From this union will arise in a short time a noble tree which will render to the husbandman a golden harvest."

After much thinking, it occurred to me that the seed which was in the fruit must be placed in the earth (its grandmother, since the parent tree was its mother). So I took it as a gift of God, sowed the seed, and when there had sprung up a little tree, I grafted it into the parent tree (first having sawn off that tree close to the ground) and when the two had grown together, they became a much more glorious tree than either of them had been before; and the fruit was that of the scion which had been inserted into the parent tree. . . . It is said that before the Spaniards reached Brazil, there were no horses in that country, so that the natives regarded a horse soldier as a monster half man and half beast; but when both horses and asses had been introduced by the strangers, it was thought most desirable to obtain also some mules which are the common offspring of these two animals. Now, there was a certain chief who possessed a large number both of asses and horses, and he took particular interest in this matter. He knew very well how to breed horses from horses, and asses from asses, but he was not acquainted with the proper method of breeding mules from both; while he was aware that all experiments which are made in the dark, *i.e.*, without the light of previous experience, are both dangerous and uncertain. The consequence was that all his efforts to produce a mule out of a stallion and a she ass were doomed to failure, no doubt because their seeds were not mixed in the right proportion. At last a Sage who was passing that way, and whose insight into the secret working of Nature was infinitely keener and more complete than that of those ignorant people, gave our chief the following advice:

"If you would obtain a mule resembling the paternal ass in length of ear and slowness of gait, you should feed each of the parents with just as large a quantity of food as their nature requires. Would you know what this proportion is? Give to the male twice as much as to the female, then a mare will conceive a mule from an ass."

This advice was taken by the chief, and, after several failures, his perseverance was crowned with complete success. Nor does it appear contrary to Nature's general plan that two different parents should produce offspring which differs from them both. Look at the leopard, which is said to be the offspring of the pard and the lioness; in the same way the wolf and bitch beget the lynx; a scion inserted into a good tree produces fruit different from those of the parent stock; new varieties of flowers are obtained by a judicious mingling of the pollen; and the red powder called "our Tincture," being mixed with quicksilver over the fire, produces gold which is utterly unlike either the one or the other. Now, these Americans are able to perform a most singular experiment with metals, and particularly with gold. They have a kind of water in which gold becomes soft like wax, and capable of being moulded with the hand into any shape they please. This water is not a corrosive, since it does not burn the fingers of those who take up the gold. But we need not doubt that it is some chemical discovery, and that it is obtained by a distilling process . . . . As I could gain no further information in America, I began to think of taking the first opportunity of crossing to Asia: I took with me a very heavy and valuable piece of a certain kind of wood, the most precious I saw here in Brazil, and which is remarkable for its brilliant ebony colour, for this black colour seems proper to America by reason of the blackish poplars and the soil dyed with various hues. The colour of this wood seems to arise from the heat of the sun, and the wonderful peculiarity of the American soil, of which

Monandez, that learned physician of Seville, writes as follows: "The variety of colour exhibited by the soil of Peru is most remarkable. If you look at it from a distance, it has the appearance of a patchwork quilt spread out to air in the sun: one part of it is green, another blue, others again are yellow, white, black, and red. Now all these are different kinds of mineral earth: the black earth, if mixed with water or wine, makes an excellent ink; the red soil is said to be the ore of quicksilver, and the Indians paint themselves with it."— Well, I took my wood, went aboard a ship, with a white unicorn for its figure head, and setting sail for Asia, soon arrived in the Persian Gulf.

### **ASIA: AIR.**

Asia is the third continent of the world, the continent which answers to the element of Air, and its climate is more temperate than that of the other continents, as it is equally remote from the intense cold of Europe, and the intense heat of Africa. Being both warm and moist, it most admirably corresponds to the element of air; its heat is almost everywhere tempered by the vapours which ascend from the sea. Moist, warm air has fire for its father, and water for its mother, and retains the most active qualities of both its parents. Thus air is a mediator between the two hostile elements, and in its own composition reconciles their strife. In the same way Asia binds Europe (earth) and Africa (fire) together, the grossest and the most subtle of the elements; but without Asia (air) there would be no union between them. By means of air, fire clings gladly to earth, and fosters it; but without air, the fire soon goes out. It is the prerogative and distinctive mark of Asia to be the centre of the world, and to bring forth such fruits as require a warm, soft air, as, for instance, dates, balsam, spices of all kinds, and gold itself. Asia is the cradle of our race, the seat of the first Monarchy, the birthplace of our Redeemer. From the Persian gulf I travelled straight through the continent, till I reached those parts of Asia Minor where Jason is said to have obtained the golden fleece. So, being greatly interested in these old world occurrences, I walked out one day to a place said to be the field of Mars, and the site of the Palace of Aëtes, the descendant of the Sun; there I met an old man of venerable aspect and authoritative port, who saluted me graciously, and to whom, after returning his salutation, I addressed the following words: "Master, if I am not troubling you too much, kindly enlighten my ignorance, as I can doubt neither your ability nor your willingness to help a stranger." He having signified his willingness to do for me all that lay in his power, I asked him whether those things which were related in history and poetry concerning Jason and his golden fleece, were real facts or mere poetical fictions. He smiled, and made the following reply to my question: "I myself am Jason, and better able than any one else to give you information concerning those things which have happened to myself. You need not be afraid, for during my lifetime I was no man's enemy, but succoured all, like a good physician; and now that I no longer belong to this world, I am still as kindly disposed towards my mortal brethren. On this spot stood the royal seat of my father-in-law, Aëtes, whose father was the Sun—not, indeed, that heavenly luminary (which would be incredible), but one likest to him in name, and face, and dignity. The golden fleece of the ram, which Mercury had transmuted, and which Aëtes had hung in the grove of Mars, I obtained in the following manner: Medea was my chief adviser, and she enabled me by her wise counsel to contend successfully against the fierce and venomous monsters. The watchful Dragon I stupefied with a narcotic, which I cast into his maw; and while he was in that helpless state, I hastened to extract his teeth. These had to be buried in earth first prepared and ploughed up by means of bulls vomiting fire, which fire was extinguished by water poured into their mouths. Then Medea gave me the images of the Sun and Moon, without which, she said, nothing could be done." I asked where I should find all these things. His answer was that he obtained them Medea, but he could not tell me where she was to be found. "When she left me in her madness," he said, "she was wedded to old Aegæus, to whom she bore Medus; Medus afterwards went to Asia, and

became the founder of the Median race." I wished to ask Jason many more questions, but he excused himself from answering them, and vanished before my eyes. Then I saw that he had been speaking of the Medicine of which I was in search, which also he had shadowed out under the figure of the golden fleece. For the crest of the Phoenix and its feathers are described by the learned as exhibiting a golden splendour. I did not indeed meet with many learned men in Asia; but I was well satisfied to have explored that blessed "aerial earth," especially as Syria and the Holy Land (with their rivers of Adonis and Jordan, in which the leper Naaman was cleansed) form part of it. In Syria, it is related that Adonis was killed by a boar, hounded on by Mars, and that from his wounds there flowed forth that balm by means of which human bodies are preserved from decomposition. On this continent stood the Holy of Holies, into which our Most High Priest entered when He had made atonement for the sins of the whole race on the Cross of Calvary; to Him, let us now utter forth the most ardent desires of our hearts in the following prayer:

O great and merciful Saviour of the world, Jesus Christ, who being God from all eternity, next madest man in time, in order that, as our Mediator, Thou mightest unite God and man, by satisfying the eternal and infinite power of God which human sin had provoked to wrath, that is to say, Thyself, the Father, and the Holy Spirit. For this purpose Thou wast born into this world and didst go about doing good among men, and didst sanctify this earth by Thy miracles, Passion, Resurrection, and Ascension. To Thee I pray from the very bottom of my heart that as Thou hast given this Medicine for the use of men by ordinary means, and meanwhile hast Thyself cured incurable diseases by Thy Divine power, Who art the Great Physician: so Thou wouldst bestow the gift of this most precious Medicine upon me, the very humblest of thy servants, who for the sake of this most blessed knowledge have taken upon myself so weary a pilgrimage, and so many toils and hardships, as Thou well knowest—in order that I may use it to the glory of Thy Name, and for the relief of my suffering brethren. Thou who art a searcher of hearts, knowest that I despise all worldly pomp, and desire to consecrate my life to Thee, if Thou wilt but work in me both the will and the power of performance: Grant to me the power of exercising boundless charity, of relieving all sufferings, both bodily and mental: Bless me with the gracious gift of Thy Medicine, which comes next in value after the peace of mind and eternal happiness which Thou hast gained for us, in order that its virtue may be effectual in the cure of human sorrow, disease, and pain; to the everlasting praise of the everblessed Trinity, world without end, Amen.

When I had poured forth this prayer to the Giver of all good things, I remembered that besides the land which once flowed with milk and honey, but now, under Turkish rule, has become utterly barren and sterile, there was also in Asia, Paradise, which was created for man while he was still perfect. Knowing that this blessed garden was situated near Babylon, I journeyed to the spot, but found nothing except a confluence of certain rivers. Thence I travelled to the maritime parts of India, and found a city, called Ormuz, of which there ran a proverb, that if the world was a ring, Ormuz would be its gem. In this city there was a great concourse of eager visitors from the whole neighbourhood; and when I asked one of them whither he was hastening, he said: "To the terrestrial paradise." "What," said I, "was I unable to find the ancient garden of Eden, and do these people speak of a new Paradise!" But the man left me standing there, and pursued his journey as fast as he could. While I was considering whether I should follow him, it occurred to me that I should do well to adopt the plan of Columbus, the discoverer of America. So I went to the different gates of the city, and determined to leave it by that one where the sweetest and most fragrant odours were borne towards me on the air. This I did, and I soon found myself on a road where the air was such as might well come from an earthly Paradise, yet was frequented by very few travellers. Ormuz being situated on an island, we soon had to cross a sea, where I saw men fishing up pearls of the purest whiteness. Having obtained some of these for love and money, I had no doubt that I had come into possession of one of

the most important substances of the Medicine, for the whiteness of these pearls was such as to defy exaggeration. After pursuing my journey on the mainland, along a very narrow by-path, for some time, I reached a point where two roads met, and there was a statue of Mercury, of which the body was silver while the head was overlaid with gold. The right hand of this statue pointed towards the Earthly Paradise; and when I had followed for some time the road which it indicated, I came to a very broad and deep river, which it was impossible to cross without a boat, though far and wide there was no boat to be seen; but the beauty of the other shore convinced me that it must be the Earthly Paradise. The trees which grew there were covered with golden, orange, citron-coloured, purple, and intensely red flowers. There were evergreen laurels, junipers, box-trees, and great store of blossoms of all colours and of the sweetest fragrance: sunflowers, amaranths, lilies, roses, hyacinths, &c. The ear was charmed with the songs and cries of nightingales, cuckoos, parrots, larks, thrushes, and hundreds of other known and unknown birds; nor was there wanting the sweet music of instruments and sweet-toned organs; the taste was gratified, as it seemed, with all manner of delicious fruits, and the fragrance which streamed out on the breeze was such as charmed while it rendered insensible the olfactory nerves of all the people who lived round about, just as the noise of the Nile cataracts becomes inaudible to those who are used to it. But what did the sight of all these glories profit me, who, for want of one little boat, was unable to get at them? So I turned away, with the firm resolution of coming back, as soon as I could do so with a better chance of success; in the meantime, I should be most likely to find the Phoenix that I was in search of, if I crossed over to Africa without further delay. So I directed my course towards the Red Sea, and there landed in Africa.

### **AFRICA: FIRE.**

When I reached Africa, more than a year had elapsed from my first setting out; the Sun had once more entered the sign of the Lion, the Moon was at her height in the house of Cancer. All these were circumstances which inspired me with hope. The intense heat of the African climate renders the whole continent torrid, sterile, and dry. It has few rivers, but many wild beasts, which meet together at the riverside, and bring forth among themselves many new and strange shapes, for which Africa is so well known. Satyrs, cynocephali, and semi-human beings are said to live there. There are the Mountains of the Moon, and Atlas that bears up the heavens on its shoulders: all these abound in minerals and in serpents. There also is collected the blood of the Dragon which the Dragon has sucked from the Elephant; but when the Elephant falls dead, the Dragon is crushed, and the blood which it has drunk is pressed out of it. Again, in the neighbourhood of the Red Sea, an animal named *Ortush* has been observed, the colour of whose head is red, with gold lines up to the neck, while its eyes are deep black and its feet white, to wit, the fore feet, but the hind feet are black, the face up to the eyes white—a description which tallies exactly with that which Avicenna gives of our Medicine. . . . Now I heard that not far from the Red Sea there lived a prophetess, named the Erythræan Sibyl, in a rocky cave; and I thought well first of all to enquire of her concerning this Phoenix. It is she that prophesied and predicted the coming of the Son of God in the flesh This assertion has indeed been questioned by many writers, but it is borne out by Eusebius, the great historian of the Early Church, and by Cicero, the great orator, who, as is well known, translated this prophecy into the Latin tongue. Abundant evidence to the same effect may also be collected from the works of Virgil, the prince of Roman poets. The passage of Cicero which is referred to by Eusebius, will be found in the second book of his treatise, *De Divinatione* (On Divination). . . . When I came to her, I found her sitting in her cave, which was beautifully overgrown with the spreading boughs of a green tree, and covered with green sod. I saluted her with the lowliest and most deferential humility. At first she seemed somewhat startled at my sudden appearance, and hastily retreated to the interior of the cave. But she was soon won over by my earnest

entreaties, and prevailed upon to shew herself at the entrance of her habitation. "Who art thou, stranger?" she enquired, "and what wouldest thou of me? Dost thou not know that a man may not approach a virgin that dwells in solitude?" "It is not forward boldness that has brought me hither," I replied; "but I have come after mature deliberation, because I feel that it is you, and you alone, that can resolve certain doubts which lie heavy on my mind. If you will shew me this great kindness, I, on my part, promise to do you suit and service, and to fulfil all your commands, as far as lies in my power." When she heard these words, her countenance cleared, and she asked me in a more kindly tone what my business was. "I cannot," she continued, "deny anything to men like you who are anxious to learn." "There are two things," I returned, "concerning which I would crave plain and straightforward instruction from you. namely, whether there was and is in these countries of Arabia and Egypt a wonderful bird named Phœnix; whether its flesh and feathers are really an effectual medicine for anger and grief; and, if so, where the bird is to be found?" "The object of your search," she rejoined, "is a great and glorious one; doubt is the first stage of knowledge, and you have also come to the right place and the right person. For the country in which you now find yourself is Araby the Blest, and nowhere else has the Phœnix ever been found; moreover, I am the only person who could possibly give you any definite information about it. I will teach you, and this land will exhibit to you, the glad sight of which I speak. Therefore, listen to my words Araby the Blest and Egypt have from of old rejoiced in the sole possession of the Phœnix, whose neck is of a golden hue, while the rest of its body is purple, and its head is crowned with a beautiful crest. It is sacred to the Sun, lives 660 years, and when the last hour of its life approaches, it builds a nest of cassia and frankincense, fills it with fragrant spices, kindles it by flapping its wings towards the Sun, and is burnt to ashes with it. From these ashes there is generated a worm, and out of the worm a young bird which takes the nest, with the remains of its parent, and carries it to Heliopolis (or Thebes), the sacred city of the Sun, in Egypt. Now, this whole tale which you find in the books of the Ancients is addressed to the mind rather than to the ear; it is a mystical narrative, and like the hieroglyphics of the Egyptians, should be mystically (not historically understood. An ancient Egyptian writer tells us that the Phœnix rejoices in the Sun, and that this predilection is its chief reason for coming to Egypt. He also relates that his Countrymen were in the habit of embalming the Phœnix if it died before its time. If you therefore regard this tale as an allegory, you will not be far wrong; and you know that the flesh and feathers of this bird were of old used in Heliopolis as a remedy for anger and grief." When I heard her say this, I was full of joy, and asked her whether she could tell me how to become possessed of this Blessed Bird and Medicine. She promised not to forsake me, and to do all in her power to help me out of my difficulty. "Nevertheless," she continued, "the most important part of the enterprise must be performed by the toil of your own hands. I cannot describe to you in exact and unmistakable terms the place where the Phœnix lives, yet I will endeavour to make it as plain to you as I may. Egypt, you know, owes all her fertility to the Nile, whose sources are unknown and undiscoverable; but the mouths by which it is discharged into the sea, are sufficiently patent to all. The fourth Son of the Nile is Mercury, and to him his father has given authority to shew you this bird, and its Medicine. This Mercury you may expect to find somewhere near the seven mouths of the Nile; for he has no fixed habitation, but is to be found now in one of these mouths, and now in another." I thanked the Virgin Prophetess most cordially for her gracious information, and at once set my face towards the mouths of the Nile, which are seven:—the Canopic, the Bolbitic, the Sebennitic, the Pelusian, the Tenitic, the Phœnetic, and the Mendesic. The way to the Canopic mouth led me through an ancient Christian burial ground, where a most miraculous occurrence is witnessed every year on a certain day in May. From dawn to noon on that day the dead bodies gradually rise from their graves until they are completely visible to the passers by; and from noon to sunset they gradually sink back again into their tombs. If this be true, as eye-witnesses testify, it is a most certain proof of the resurrection of the human body, and exhibits a close analogy to the resuscitation of the dead Phœnix. . . .

When I reached the island of Canopus, I enquired where Mercury was to be found. But the people were

only hopelessly puzzled by my questions. Some said that, according to Hermes, Egypt exhibits an image of the heavens, and the seven mouths of the Nile (of which the Canopic is the most considerable) correspond to the seven planets; the Canopic mouth they called the habitation of Saturn, the grandfather of Mercury; Mercury was to be found domiciled in some other mouth of the river. At the Bolbitic mouth none of those persons of whom I enquired knew anything about Mercury. Near the third or Sebennitic mouth stood the city of Sebennis, of which the inhabitants were so savage and cruel towards strangers, and so utterly destitute of all the arts and graces of civilisation, that I could not conceive of Mercury, the god of culture and science, living in their midst. Moreover, a certain peasant whom I asked whether Mercury's house was there, told me that he had a house in the town but that he never lived there. So I at once went on to the fourth or Pelusian mouth of the Nile. The famous city of Pelusium is said to have been founded by Peleus, the father of Achilles. It separates Asia and Arabia from Egypt, and was at one time a most wealthy town. When I heard of its greatness in commerce and industry, and of the large quantities of Arabian gold which are imported in this city, one of the wealthiest marts of Egypt, I felt assured that I should find the dwelling of Mercury here; but I was told by the inhabitants that he did not come there very often, though he was received as a most welcome guest whenever he did visit it. This answer filled me with dismay, which was in proportion to the hopes which I had conceived, but I determined not to abandon my search till I should have visited the three remaining mouths of the river.

At the Tenitic mouth of the Nile, I learned quite as much as I had learned everywhere else, namely—nothing. When the people who lived there told me that Mercury never came to them at all, I began to bewail my hapless fate, and the many fruitless journeys I had undertaken; and I now saw that perhaps it would have been wiser to have begun at the other end. There, however, I was; only two mouths of the river were left; and in one of these Mercury would be found, if indeed the Prophetess had spoken true. At the Phœnetic mouth another disappointment awaited me. Mercury had once lived there, but had long since migrated somewhere else. At the seventh, or Mendesian mouth, nothing whatever was known about him.

It may easily be imagined that, after this long series of disappointments, I began to suspect the Sibyl very strongly of having sent me on a fool's errand; for I had now visited every one of the mouths of the Nile, and yet had not found even a trace of Mercury in any of them. Or if the words of the prophetess had been true, it seemed as if the various people of whom I had enquired must have deceived me with false information. But after more mature consideration of the answers which had been returned to my questions in the different places, I arrived at the conclusion that I had merely misapprehended their meaning. So I retraced my steps, and at length succeeded in finding Mercury in one of the mouths, where the people had at first appeared to know nothing about him. He sheaved me at great length, where I must look for the Phoenix and where I could obtain possession of it. When I reached the place to which he directed me, I found that the Phoenix had temporarily deserted it, having chanced to be chosen umpire between the owl and other birds which pursue it, of which battle we have treated otherwise. It was expected back in a few weeks; but, as I could not afford to wait so long just then, I thought I might be content with the information I had gained, and determined to consummate my search at some future time. So, having returned to my native land, I composed the following epigrams in honour of the Sibyl, Mercury, the Phoenix, and the Medicine.

## EPIGRAM

*In Honour of the Erythræan Sibyl, named Herophyle.*

"I thank thee, great prophetess, whose inspiration is not of the fiend, but of the Spirit of God, that thou didst direct me on my way to the Son of Nilus, who should shew unto me the bird Phœnix. Full of sacred knowledge, thou didst utter forth thy oracles when thou didst sing of God who should come in the fashion of a man. Thou dost love Him who, bearing the sentences of highest justice, will be the omnipotent judge of the whole world, though thou wert called a Gentile Maiden, and though men said that thou couldst know nothing of Him. The cave near the Red Sea cannot hold thy greatness, when Christ shall claim thee for His own in Heaven."

## EPIGRAM

*Dedicated to Mercury of the Sages.*

"The Latins call thee Mercury, the Messenger of the Gods; among the Greeks thy name is that of great Hermes. Thou art called Tenthius on the soil of Egypt; thy father is Nilus, who enriches that soil, and has bequeathed unto thee untold wealth. Thou hast duly conveyed to the peoples of Egypt the laws which Vulcan, being in the secret with thee, has given. All nations of the world behold thee with delight, yet thou desirest to be known to very few. Of how many secrets of Nature have the keys been entrusted to thy keeping! Thy face is red, thy neck is yellow, thy bosom is whiter than purest snow. Thy feet are shod with black sandals, a wand with a double snake in no wise hurts thy hand. This is thine apparel whereby thou art known to all, O Hermes! Thy complexion is fittingly of four hues. Thou didst shew to me the glorious bird Phœnix by the mouth of an interpreter, and I thank thee for thy love with all my heart; though the words be light, they are weighty with gratitude."

## AN EPIGRAM

*In Praise of the Phœnix.*

"O Marvel of the World, prodigy without a blot, unique Phœnix who givest thyself to the great Sages! Thy feathers are red, and golden the hues of thy neck; thy nest is built of cassia and Sabœan frankincense. When thy life is drawing to a close, thou knowest the secret way of Nature by which thou art restored to a new existence. Hence thou gladly placest thyself on the altar of Thebes, in order that Vulcan may give thee a new body. The golden glory of thy feathers is called the Medicine of health, and the cure of human woe. Thou has power to cast out disease and to make the old young again. Thee. Blessed Bird, I would rather have than all the wealth of the world, and the knowledge of thee was a delight which I sought for many years. Thou art hidden in the retreat of thine own nest, and if Pliny writes that he saw thee in Rome, he does greatly err. Thou art safe in thy home, unless some foolish boy disturb thee: if thou dost give thy feathers to anyone, I pray thee let him be a Sage."

*On the Hermetic Medicine of the Phœnix.*

"If all the mountains were of silver and gold, what would they profit a man who lives in constant fear of death? Hence there cannot be in the whole world anything better than our Medicine, which has power to heal all the diseases of the flesh. Wealth, and riches, and gold, all yield the prize to this glorious possession: and whoever does not think so, is not a man, but a beast."

*"If anyone will not acknowledge the force of reason, he must needs have recourse to authority."*

# **A Tract Of Great Price**

**Concerning The Philosophical Stone.**

**Published By A German Sage In The Year 1423,**

**Under The Following Title:**

**The True Teaching Of Philosophy**

**Concerning The Generation Of Metals**

**And Their True Origin.**

## **Chapter I**

All temporal things derive their origin, their existence, and their essence from the earth, according to the succession of time. Their specific properties are determined by the outward and inward influences of the stars and planets, (such as the Sun, the Moon, Etc.) and of the four qualities of the elements. From these combined circumstances arise the peculiar forms, and proper substances, of all growing, fixed, and generating things, according to the natural order appointed by the Most High at the beginning of the world. The metals, then, derive their origin from the earth, and are specifically compounded of the four qualities, or the properties of the four elements, their peculiar metallic character is stamped upon them by the influences of the stars and planets. So we are informed by Aristotle in the fourth book of his Meteor., where he says that quicksilver is the common substance of all metals. The first thing in Nature, as we said before, is the substance which represents a particular conglomeration of the four elements which the Sages call Mercury or quicksilver. But this quicksilver is as yet imperfect, on account of its gross and earthy sulphureous nature, which renders it too easily combustible, and on account of its superfluous watery elements, which have all been collected together out of the four elements by the action of the heavenly planets. This substance is composed of a hot sulphureous earth, and a watery essence, in such a way that the sages have called it imperfect sulphur.

Now, since Nature is always striving to attain perfection and to reach the goal set before her by the Creator of all things, she is continually at work upon the qualities of the four elements of each substance; and so stirs up and rouses the inward action of the elements by the accidental heat of the Sun, and by natural warmth that there arises a kind of vapour or steam in the veins of the earth. This vapour cannot make its way out, but is closed in; in penetrating through fat, earthy, oily, and impure sulphureous substances it attracts to itself more or less of these foreign and external impurities. This is the reason that there are seen in it so great a variety of colours before it attains to purity and its own proper colour.

Those mineral and metallic substances which contain the largest proportion of efficacious sulphureous and mercurial vapour are the best; and each quality of the four elements has its own peculiar operation and transmuting influence in such a conglomeration of various substances -- their action being roused by the sulphur of the earth and the outward heat of the Sun. Through these agencies the Matter is often dissolved and coagulated, till that which is pure, or impure, is borne upward; and this is the work not of a few years, but of a great length of time. Nature has to purge away the peculiar characteristics of all other metals before she can make gold; as you may see by the fact that different kinds of metal are found in the same metallic vein. This fact may be explained in the following manner. When the sulphureous and mercurial vapours ascend they are mixed, and united by coction, with the aforesaid substance. If those sulphureous vapours are earthy thick, and impure, and the heat of the Sun, or their own natural heat, have too sudden and violent

an effect, the substance hardens, with all its sulphureous impurities before it can be purged of its grossness, and it becomes more like metallic sulphur. If the quicksilver is hardened, the whole mass takes the form of some metal, according to the influence of the particular planet with which it is penetrated. For Nature first combines the four elements into some substance or body, which then receives its specific properties through the influence of some planet. Such is the origin of copper, tin, lead, iron, and quicksilver. But it is not essential that I should here describe at length the specific composition and distinctive properties of each of the imperfect metals; they are all mingled in various proportions of impure sulphur and inefficacious quicksilver. Nature, as I said, is ceaselessly at work upon these imperfect metals purging and separating the pure quicksilver from the impure, and the pure sulphur from the impure, until all their grossness is removed and they become what God designed that they should be, viz., gold. But if these vapours float upward in their original pure condition, with their inward pure and subtle earth, without becoming mixed with gross, earthy, and sulphureous alloy, and if they succeed in breaking forth into the open air before they become hardened into a sulphureous mass, they remain quicksilver and are not changed into any metal.

If, however, this pure quicksilver floats upward in a pure mineral earth, without any gross alloy, it is hardened into the pure and white sulphur of Nature by being subjected to a very moderate degree of gentle heat, and at length assumes the specific form of silver. Like all the other metals it may still be developed into gold if it remain under the influence of its natural heat. But if the same pure, unalloyed quicksilver be subjected to a higher degree of natural heat, it is transmuted into the *purered* sulphur of Nature and becomes gold without first passing through the stage of silver. In this form it remains, because gold is the highest possible stage of metallic development.

Quicksilver is the mother of all metals, on account of its coldness and moistness; and if it be once purified and cleansed of all foreign matter it cannot be mixed any more with grossness of any kind neither can it be changed back into an imperfect metal. For Nature does not undo her work, and that which has once become perfectly pure can never become impure again. Sulphur on the other hand is the father of all metals, on account of its heat and dryness. In the following chapter we shall refer to this difference, and speak more in detail about quicksilver.

## Chapter II

There is, then, in *all* metals true mercury and good sulphur in the imperfect as well as in the perfect metals. But in the imperfect metals it is defiled with impure matter and stands in need of maturing. Hence you see that all metals may be changed into gold and silver, if the golden and silver properties that are in them be freed from all alloy and reduced by gentle heat to the form of silver or gold. Those metals, indeed, which have been torn up by the roots, that is to say, that have been dug up from their own proper soil in the veins of the earth, can no longer proceed in that course of development which they pursued in their native abode; yet, as much as in them lies, they strive to be perfected. Now the Spirit of Truth, who imparts all true knowledge, has taught the Sages a Medicine or Form, by which all the impurities of the imperfect metals may be removed, and the perfect nature, or true mercury, which is in them, transmuted into gold and silver.

## Chapter III

But we must now proceed to say a few words about the method of preparing this Medicine, by which the imperfection is removed from imperfect metals through the mediation of perfect mercury, and the mode of gold and silver is developed in them.

I find that the writings of the Sages are all about gold, silver and quicksilver, which it is said must be reduced to the form which they wore before they became metals; that is to say, the form which they wore perhaps some thousands of years ago. But the operation of Nature is progressive, not retrogressive. Hence it is a great mistake to suppose that the work of Nature can be reversed by dissolution in aqua fortis or by the amalgamation of gold or silver and quicksilver. For if the metal be plunged in a solvent, if water be distilled from it, or if quicksilver be sublimed from it, it still remains the same metal that it was before. The specific properties of a metal cannot be destroyed so as to obtain the first substance. Yet Aristotle says that metals cannot be changed unless they are reduced to their original substance.

#### Chapter IV

What we have said in the last chapter shows that Alchemical Art cannot be concerned with the subjecting of gold, silver or quicksilver to chemical processes. Nevertheless, that which you read in the books of the Sages is most true and we shall see in the following pages in what sense it is to be understood, that our Art is in gold, silver and quicksilver. But it is clear that our art can make no use of quicksilver such as may be obtained from the metals by means of any kind of artificial process, such as dissolution in aqua fortis, or amalgamation or any other method of chemical purification.

If then, this is not the right substance or original mercury, it is clear that it is not to be found in the metals. For even if you melt two, three, or four metals together, yet not one of them can give the others any aid towards attaining perfection, seeing that itself stands in need of external aid. And even though you mix some imperfect metal with gold, the gold will not give up its own perfection for the purpose of succouring the other for it has nothing to spare which it might impart to the imperfect metal. And even if the imperfect metal could assume the virtue and efficacy of the gold, it could only do so at the expense of the gold itself. In vain, then, shall we seek in metals the Medicine which has power to liberate the perfect mercury contained in imperfect metals.

#### Chapter V

Again, we read in the books of the Sages that quicksilver and mercury are the original substance of all metals. These words are true in a certain sense. But by many beginners they are supposed to mean ordinary quicksilver. Such an interpretation, however, makes nonsense of the dictum of the Sages. For ordinary quicksilver is an imperfect metal and itself derived from the original substance of all metals. The Sages, indeed, say little about the *origin* of their mercury but that is exactly because they use the name of mercury or sulphur, for the first substance of their perfect metals. If common mercury were not a metal, there would be no metal corresponding to the celestial influence of the planet Mercury as gold and silver receive their specific properties from the influence of the Sun and Moon. Now, as it is one of the metals the other metals cannot be derived from it, much less can their properties be derived from it or from themselves, although the real perfect mercury is quite as abundant in mercury as in any other metal. Nor can common sulphur be the first substance of the metals, for no metal contains so much impurity as common sulphur; and if it be mixed with any metal, that metal becomes even more impure than it was before, and is even partially, or wholly, corroded.

#### Chapter VI

Again, the Sages affirm that quicksilver, or mercury, is the spirit of the specific nature of metals, collected out of the four elements by the influence of the Planets, and the operation of Nature in the earth -- and that from it is developed either gold, silver, or some other of seven metals, according to the peculiar effects of the predominant planetary influence.

Hence ignorant alchemists have supposed that all this is true of the common quicksilver, because it amalgamates with all metals, and is soft and volatile. But why should its volatile properties prove it to be no metal? According to this definition, we might deny the metallic character of tin, lead, and other metals, because they do not remain fixed in a fierce fire -- though one can stand a greater degree of heat than another. If, again, any substance is to be called the first substance of metals because of the facility with which it amalgamates with them, copper would have a better claim to be so regarded, since it enters into a closer union with gold and silver than mercury, and shares both their fusible and malleable nature. But that is no final union, for it admits of separation; and quicksilver may, with the greatest ease, be separated from the metals with which it has amalgamated. A true union of metals can only take place in the original substance which is common to all. We do find amalgams of three or even more metals; but then this union was consummated in the first substance, which is *one*, and the whole amalgam would have been developed into gold, if its natural growth had not been retarded by gross, sulphureous, arsenical, and earthy impurity, which is found among metals when purified. The metals which we dig up out of the earth are, as it were, torn up by the roots, and, their growth having come to a standstill, they can undergo no further development into gold, but must always retain their present form, unless something is done for them by our Art. Hence we must begin at the point where Nature had to leave off: we must purge away all impurity, and the sulphureous alloy, as Nature herself would have done if her operation had not been accidentally or violently, disturbed. She would have matured the original substance, and brought it to perfection by gentle heat, and, in a longer or shorter period of time, she would have transmuted it into gold. In this work Nature is ceaselessly occupied while the metals are still in the earth; but she takes away from them nothing save their superfluous water and the impurity which prevents them from attaining to the nature of gold, as we briefly showed in the second chapter.

## Chapter VII

It is clear, then, that the final union of metals, or their perfection, cannot be attained by the mingling of any specific metals; that the metallic substance becomes useless for our purpose, as soon as it assumes a specific form; but that, at the same time, all metals have a common origin, or Matter, which is one thing, flowing out by the operation of nature, who ever desires the most perfect form which her own essence and her condition will admit. And this is the form of gold, highest and best of all that belong to the metallic mode. If, then the purest form of this substance which it is possible for Art to prepare with the help of Nature, be added to the imperfect metals then it overcomes what is impure in these, for it is not the impure, but the pure matter which is like unto it. But you must not suppose that this power belongs to common gold; common gold has its own specific form, which it is unable to impart to other metals. The power of gold is sufficient only for preserving its own excellence; but our prepared substance is much better and more honourable than gold, and has power to do that which gold cannot do, viz, to change the common matter of all metals into gold.

## Chapter VIII

From what I have hitherto said, one ignorant of alchemy might suppose that the teaching of the Sages is

altogether false and untrustworthy. Therefore I must now proceed to tell you how it may truly be affirmed that our Art is concerned with quicksilver silver, and gold, or with quicksilver and sulphur, and in what sense mercury is the spirit of the metals. I will first speak about quicksilver, and at once premise that this word is not here taken to mean that common quicksilver which is one of the metals, but the first substance of all the metals, and itself no specific metal at all. For a metal must have derived its distinctive properties through planetary influences; nor can any one metal be the first substance of all metals. This quicksilver is neither too hot, nor too cold, nor too moist, nor too dry; but it is a well-tempered mingling of all four. When perfectly matured quicksilver is subjected to external heat, operating thereon, it is not burned but escapes in a volatile essence. Hence it may well be called by the philosophers a spirit, or a swift, and winged, and indestructible soul.

So long as it is palpable and visible it is also called body; when subjected to external cold it is congealed into a fixed body, and then these three, body, soul, and spirit, are one thing, and contain the properties of all the four elements. That outward part which is moist and cold is called *water*, or quicksilver on account of its inward heat it is called air; if without it appear hot and dry it is fire, or sulphur; and on account of its internal coldness it is also styled *earth*. In this way quicksilver and sulphur are the original substance of all metals; but, of course, I do not mean that the substance is prepared by mixing common sulphur and quicksilver. The sulphur and quicksilver of the Sages are one and the same thing, which is first of the nature of quicksilver, or moist and watery and is then by constant coction transmuted into the nature of sulphur, which may Most justly be described as dry and igneous.

## Chapter IX

But I wish to confine my discourse to the quicksilver and sulphur of the philosophers, from which all metals derive their origin; and it is according to the Sages a heavy earthy water mixed with very subtle white earth, and subjected to natural coction until the moist and the dry elements have become united and coagulated into one body -- through the perfect mutual adjustment of all the elementary properties, and by the accidental operation of cold. This is the substance which is used for the purposes of our Art, after it has been perfected and purified by gentle coction, and freed from its earthy and sulphureous grossness, and the combustible wateriness of the quicksilver. It is then one clear, pure and indestructible substance, proceeding from a duplex substance, exhibiting in their greatest purity and efficacy the united properties of quicksilver and of sulphur. In art the operation is similar to Nature. Hence the Sages have justly affirmed that our Art is concerned with quicksilver, gold, and silver. For in its first stage the substance resembles quicksilver which is sublimed by gentle natural heat, and purified in the veins of the rocks in the form of a pure vapour, as we explained above. To it we know add silver and gold, and that for the following reason, because we cannot find anywhere else in any one thing the metallic power needed for rousing the sulphur of the quicksilver, and coagulating it, except in gold and silver For the Sage cannot prepare our quicksilver unless it be first removed from the earth, and separated from the potency of its natural surroundings; and all these natural influences can be artificially supplied only by the addition of gold and silver. Our Art then has to find a substitute for those natural forces in the precious metals. By them alone it is able to fix the volatile properties of our quicksilver, for in them alone do use find the powers and influences which are indispensable to our chemical process. You should also bear in mind that the silver should be applied to our quicksilver before the gold, because the quicksilver is volatile, and cannot with safety be subjected all at once to great heat. Silver has the power of stirring up the inherent sulphur of the quicksilver, whereby it is coagulated into the form of the Remedy for transmuting metals into silver, and this coagulation is brought about by the gentle heat of the silver. Gold requires a much higher degree of heat and if gold were added to the quicksilver before the silver, the greater degree of heat would at once change the quicksilver into a red

sulphur, which, however, would be of no use for the purpose of making gold, because it would have lost its essential moisture; and our Art requires that the quicksilver should be first coagulated by means of silver into white sulphur, before the greater degree of heat is applied which, through gold changes it into red sulphur. There must be whiteness before there is redness. Redness before Whiteness spoils our whole substance.

## Chapter X

The quicksilver of the Sages has no power to transmute imperfect metals, until it has absorbed the essential qualities of gold and silver; for in itself it is no metal at all, and if it is to impart the spirit, the colour, and the hardness of gold and silver, it must first receive them itself. It is with the first substance of metals as it is with water. If saffron is dissolved in water, the water is coloured with it, and if mixed with other water, imparts to that water, too, the colour of saffron. Unless the first substance, or quicksilver, is tinged with silver and gold, and coagulated by their efficacy, it cannot impart any colour, or coagulate the 'water or) first substance which is latent in the imperfect metals. For it is essentially a spirit. and volatile. and if it be added to imperfect metals, it cannot act upon their water, or undeveloped first-substance, because that is partly fixed by their coagulated sulphur. But if the first-substance has been fixed by means of gold and silver it has become a fixed and indestructible water: and, if added to imperfect metals. takes up into its own nature their first substance, or water, and mingles with it. By this means all that is combustible and impure in them is driven off by the fire. And herein is the saying true which was uttered by the Sage Haly: The spirit (i.e. quicksilver is not coagulated, unless the body 'i.e., gold and silver' be first dissolved." For then gold and silver become spiritual. flowing, capable of being assimilated by the common substance of all metals, and of imparting to it their own metallic strength and potency. And even though this new substance be fusible in the fire, yet, when it cools again, it still remains what it was, nor is it ever again converted into a permanent spiritual substance. It is the quicksilver, then that constitutes the chief strength and efficacy of our Art; and he that has no quicksilver is without the very seed of gold and silver from which they grow in the earth.

## Epilogue

We have sufficiently explained that quicksilver is the first substance of the metals, without which no metal can become perfect, either in Nature or in our Art. But we do not yet know where to look for it, and where to find it. This is the great secret of the Sages, which they are always so careful to veil under dark words that scarcely one in many thousands is thought worthy to find the philosophical Mercury. Many things have been written about it; but I will quote the words of *one* philosopher which I consider as the most helpful: In the beginning, he says, God created the earth plain, simple, rich and very fertile, without stones, sand, rocks, hills, or valleys, it is the influences of the planets which have now covered it with stones, rocks, and mountains, and filled it with rare things of various colours, i.e., the ores of the seven metals, and by these means the earth has entirely lost its original form, and that through the following causes:

First, the earth which was created rich, great, deep, wide and broad, was, through the daily operation of the Sun's rays penetrated to her very centre with a fervent, bubbling, vaporous heat. For the earth in herself is cold and saturated with the moisture of water At length the vapours which were formed in this way in the heart of the earth became so strong and powerful as to seek to force a way out into the open air, and thus, instead of effecting their object, threw up hills and hillocks or, as It were, bubbles on the face of the earth. And since in those places where mountains were formed the heat of the Sun must have been most powerful,

and the earthy moisture rich and most plentiful, it is there that we find the most precious metals. Where the earth remained plain, this steam did not succeed in raising up mountains; it escaped, and the earth, being deprived of its moisture, was hardened into rocks. Where the earth was poor, soft, and thin, it is now covered with sand and little stones, because it never had much moisture, and, having been deprived of the little it possessed, has now become sandy and dry, and incapable of retaining moisture. No earth was changed into rocks that was not rich, viscous, and well saturated with moisture. For when the heat of the Sun has sucked up its moisture, the richness of the earth still makes it cohere, although now it has become hard and dry; and earth that is not yet perfectly hard is even at the present time undergoing a change into hard stones, through the diligent working of Nature. But the steam and the vapours that do not succeed in escaping, remain enclosed in the mountains, and are day by day subjected to the maturing and transmuting influences of the Sun and the planets. Now, if this vaporous moisture become mixed with a pure, subtle, and earthy substance, it is the quicksilver of the Sages; if it be reduced to a fiery and earthy hardness, it becomes the sulphur of the Sages. This enquiry opens up the way of finding our quicksilver, or first substance of the metals, but though it be found in great quantities in all mines, it is known only to very few. It is not silver, or gold, or common quicksilver, or any metal, or sulphur. The Sage says: It is a vaporous substance out of four elements, watery and pure, and though it is found with all metals, it is not matured in those which are imperfect. Hence it must be sought in the ore, in which we find gold and silver." And when again he says, "If this quicksilver be hardened, it is the sulphur of the Sages." he means that this can only be done by means of gold and silver, which it takes into itself, and by which it is sublimed and coagulated through its own natural gentle coction, under the influence of the Sun's heat, and in its own proper ore.

O heavenly Father, shew this quicksilver to all whom Thou biddest walk in Thy paths!

# A VERY BRIEF TRACT CONCERNING THE PHILOSOPHICAL STONE

WRITTEN BY AN UNKNOWN GERMAN SAGE,  
ABOUT 200 YEARS AGO, AND CALLED THE BOOK OF ALZE,  
BUT NOW PUBLISHED FOR THE FIRST TIME

## THE BOOK OF ALZE

DO not, gentle Reader, find fault with me for speaking first about the Moon, then about the Sun, and the other planets, and only in the third place about our most excellent Medicine, ALZE. In this case that which is last is better and more honourable than that which is first. The substance must first become white, and then red; it cannot become red unless it have first become white. Hence Simon the Sage says: "Know that unless you first make the Stone white, you cannot make it red." For by the red are the rest of the planets united, and the Medicine appears unawares unless this order is observed in the matter of the white and red. So is the Moon first taken and makes, with the white, Elixir, that is, the white of the Moon to the white of Mercury out of bodies comes to the red. Whence our Sages say that the red is hidden in the white, which they do not dare to extract, until the whole substance has become red. When the substance has been subjected to the influence of the Moon, it may then, in the second place, be brought under the influence of the Sun, which will bring the Medicine to perfection without any aid from the other planets. By which you may understand why the Medicine comes last, even as from the Father proceeds the Son, and the Holy Spirit from both of these. He that hath ears to hear let him hear, and comprehend the brief statement of our Art, which is given in "The Crowd": "Know that the true Tincture can be prepared only out of our ore." Concerning this ore I therefore propose to give you the only explanation that is required, and I shall be careful to supplement and confirm my own opinion by quotations from other Sages. I shall speak not only about our ore, but also about our union or conjunction of water and mercury. For Eximenus says: "Nothing profitable can arise out of the elements without conjunction and gentle coction." Our ore Lucas calls the white ore, and it goes by many other names on account of the many colours which it exhibits in the various stages of the chemical process. But though the jealousy of the Sages has described it under various names, it is, and remains only one substance. Pythagoras says: "Many names are given to it; nevertheless, it is nothing else but the one and true Matter, and this is by reason of the development of its nature. The envious have described it by the names of all bodies, as, for instance, a coin, lead, copper, etc., according to the variety of its colours." So Lucas tells us that we have no need of many things, but only of one thing. Diamedes and Basan say: "Do not add to it any foreign substance; for the common substance of metals is one thing, and more excellent than all other things." Hence our whole Art is concerned with water, and a twin substance that ameliorates the water. Synon tells us that sulphur and our ore are derived from one thing, and changed into four. Lucas says: "The white ore is subjected to coction till it generates itself. Thus it becomes united in all its four elements, and receives a living soul. It is never more than one thing, but as a man consists of body, soul, and spirit, and yet is no more than one person, so our substance consists of body, soul, and spirit. The ore receives its strength, spirit, and growth from the water." The Sages say: "If the ore be often deadened in its coction, it becomes all the more excellent, and if the body have a soul after the manner of man." The body does not penetrate the soul, but the soul penetrates the body, because it is volatile. The soul, which is hidden in the four parts of the body, is called sulphur. These bodies are male and female, and by their mutual operation our substance becomes water. Aristeus says: "Observe the indestructible water which issues from it." Take the humidity which it gives off. Hence other Sages say: "Take water with its

twin substances, and let it be dried up by means of the vapour which is like it, and coagulated in its own water." That water is also called poison; it is the principle of life, because it is a soul, and extracted from many things. All bodies that this Tincture enters are quickened; all bodies from which it is extracted are destroyed. Its potency is spiritual blood, which, if well mixed with bodies, transmutes them into spirits, and combines with them into one substance. The body attracts the spirit, and the spirit tinges the body with a spiritual substance like blood. For the Sages say that whatever has a spirit has blood. If the venom penetrate the body, it imparts to it an indestructible colour, and then the soul cannot be separated from the body any more. If in flying it faces round and meets its pursuer, then is the flight at an end. The two belong together, and Nature always tends to assimilate kindred substances. The final colour is indestructible, because the soul pervades every part of the body, and is inseparably bound up with it. Though the water is naturally cold, yet we must beware of too fierce a degree of heat; for if the moisture of the substance be dried up, our work must come to nought.

That which is called the spirit, is the active, or male principle, and can only be obtained by the dissolution of the body. Accordingly, we must understand this of the humidity which results, namely, that which is produced, as long as two spouses are conjoined after a lawful manner, even unto the white. Would you know when the body has been rendered liquid by coction? Hear what Bonellus answers: "When you see a black substance floating in the water, you may know that the body has been dissolved."

These two, body and spirit, have a third thing which represents their common substance, and is, in its turn, called their body. It is also called a round cloud, death, blackness, darkness, shadow, ashy lead, or a metallic and subtle ore; or it is described, after that which is obtained from it, as gold that was hidden in the body of Magnesia. Hence it is said: "Extract the shadow thereof from the splendour." This also is the substance of which so many have spoken. Three things constitute the true ore, viz., body, soul, and spirit. Hence it is compared to an egg, because in an egg, too, the chicken is developed out of three things. Thus also Alchemy is produced out of the above-mentioned three things, as many philosophers do testify in "The Crowd." The male principle, or the water, is also called the "nature"; for water is a natural agent which dissolves the elements of bodies, and then again unites them. Concerning this water, it is said by Ficinus, that its nature has the wonderful power of transmuting the body into spirit. Where it is found alone it overcomes all other things, and is an excellent, harsh, and bitter acid, which transmutes gold into pure spirit. Without this acid we cannot attain either the red, or the black, or the white. When it is combined with bodies, then the body changes into spirit, by a heavenly fire, and immutable, indestructible tincture. Know also that the union must be brought about by a gentle fire, since the elements cannot stand a fierce fire, until the union has taken place. When the gentle heat is applied, the elements devour and consume each other, and yet again, on the other hand, comfort and strengthen each other, and teach each other to stand the test of fire. Hence the Sages say: "Invert the elements, and you will find what you seek." To invert the elements is to make that which is moist, dry, and that which is volatile, fixed. The husband also enforces conjunction that he may reproduce his own likeness. Many strive to accomplish this separation and conjunction; but few succeed in bringing about an union which can stand the test of fire. The composition which is prepared out of our precious substance is not even in the slightest degree diminished in volume by fire. Rather, it is nourished by fire, as a mother nourishes her child. These are the only things that have the power of making red and white, both inwardly and outwardly. Remember that at first they can only bear a gentle fire. When you see that a whiteness begins to appear it must be your next care to extract it from the black substance; then you should develop the redness which is hidden in it. But the latter object you must attain, not by extraction, but by gentle coction. Do not marvel that the Sages describe our ore under many names, and as consisting of body, soul, and spirit. They are also referred to as brothers, or as husband and wife. But

Geber says that sometimes the whole substance is only called body, or spirit; and unless there be a dissolution into water, our work cannot be brought to a successful issue. Of course, we do not mean the water of the clouds, as the foolish say, but a permanent water, which, however, cannot be permanent without its body. Thus Hermogenes says that we are to take the hidden spirit, and not to despise it, because it shares its great power with its brother. For only the union of the two can give us the right Tincture. The water is also called a most sharp acid, with which the body must be washed; this is what Socrates calls "woman's work, and child's play." The secret of our Art is the union of man and woman: the husband receives the tinging spirit from his wife. The union of husband and wife coagulates the female principle; and if the whole be transmuted into red, we have the treasure of the world, of which Synon says: "If the water be changed into the body, the body is changed, first into earth, then into dust and ashes, and you have what you want."

Then the work is over, and the Stone contains within itself the Tincture in the body of Magnesia. Therefore, the Sages say, in conclusion: "My son, extract from the splendour its shadow." Accordingly, we need exertion, and exercise is beneficial to us, seeing that milk is for infants, but that strong men require stronger food. So also is it in this operation of the Stone.

Now, it is laid down by Geber that our Art must do more for the substance than Nature has done for it; otherwise we should never obtain the Medicine which has the power of correcting and perfecting the essences of the seven planets, or metals. For this purpose the Art of Alchemy has been delivered to us by the Sages; but the beginner must be on his guard against being misled by their manner of speaking, and the multiplicity of names which they give to our substance, which has been suggested to them by its great variety of (successive) colouring, and by the fact that it is composed of the four elements. The Stone must be saturated with its water, that it may imbibe it all, and then subjected to the action of fire, until it turns to a kind of dust, like burnt blood, and becomes indestructible by fire. This Stone is sought by Kings, but is found only by those to whom it is given of God. It is publicly sold for money. But if men knew its precious nature, they would cease to think lightly of it. God, however, has hidden it from the world, and he who would accomplish our work should first lay the right foundation, or his building must come to nought. Let me tell you, then, that our Stone requires a gentle fire; and if, after not many days, it die, and lie in the tomb, yet God restores to it its spirit, and removes its disease and its impurity. When it is burnt to ashes, it must be well sprinkled and saturated with its blood, until it becomes like burnt blood. Hermes remarks that both substances rejoice in being united to each other. To the spiritual substance God gives that which Nature could not give it. For Nature has nothing so precious as the true Tincture; and if with its bodies it become liquid, it produces a marvellous effect. For the Tincture changes everything it is mixed with into its own nature, and makes it white both within and without. By one operation and way, by one substance, and by one mixing, the whole work is accomplished, while its purity is also one, and it is perfected in two stages, each consisting of a dissolution and a coction, with the repetition of these.

It must be your first object to elicit the whiteness of the substance by means of gentle and continued coction or heat. I know that the Sages describe this simple process under a great number of misleading names. But this puzzling variety of nomenclature is only intended to veil the fact that nothing is required but simple coction. This process of coction, however, you must patiently keep up, and that with the Divine permission, until the King is crowned, and you receive your great reward. If you ask whether the substance of our Stone be dear, I tell you that the poor possess it as well as the rich.

Many have been reduced to beggary because they foolishly despised that which is highly esteemed by the

Sages. If kings and princes knew it, none of us would ever be able to obtain it. Only one vessel is required for the whole process, which should be of stone, and should be capable of resisting fire.

A pound of the body of our ore should be taken, and rendered as pure, refined, and highly rectified, like the virtue of heaven, as the philosophers have it. Then the vessel should be placed in a reverberatory alembic. This should be set over a gentle fire, the vessel being kept tightly closed, in order that it may be able to retain its companion, and permit the same to enkindle the whiteness thereof, as Lucas says. The vessel containing the ore must be placed over the fire, since there can be no perfection without heat and intermixture of elements, seeing that it is produced from blood. When the male and the female principle have been together for a space of forty nights, there is an emission of moist warm seed; and to the same God has liberally given much blood to heat it. This seed develops into an embryo which is supported with a little milk over a moderate fire, and grows stronger day by day. Its growth must be aided by warmth; but the heat of the fire should be temperate, like that of the Sun. This may be effected by placing our vessel over an empty vessel, and that again upon some glowing coals. The process of coction should be continued until the alembic is well dried and the substance begins to assume a liquid aspect; for water alone is sufficient for the coagulation and fixing of the whole, as we are told by Democritus. This water is described under various names, such as sulphur, quicksilver, spirit, and also vapour, for it can scarcely retain its companion. There are in our Art only two substances, and if I speak of two, then I think of four, all which things require one thing, by which Nature, conquering all Nature, is extracted. For Nature, on account of its nature, rejoices in itself, Nature conquers nature, and in itself contains nature. At the same time one is not opposed to the other, but one comprehends the other, whereby it excels the other, and the philosophers call this water the purifying water.

This dissolution first imparts a black appearance to the body. The substance should then turn white, and finally red. The blackness exhibits an intermediate stage between fixedness and volatility. So long as there is blackness, the female principle prevails, till the substance enters into the white stage. This whiteness is called the first power of our Stone, and the water is referred to as that most excellent acid. You must be very careful not to destroy the potency of this water. Avicenna says that natural heat operating in humid bodies, first causes blackness; then removes the blackness; and finally causes whiteness, as may be seen in calx. Hence our substance must become first black, and then white, and be reduced to a kind of powder. Then the soul must be restored to the powder by a powerful fire; and both [be] subjected to coction until they become first black, then white, afterwards red, and finally good venom, the whole being accomplished by the separation of waters. And now, the waters being divided, cook the matter and the vapour till coagulation takes place, and there is made a white stone. Then are the waters divided. Another mortification, or exsiccation, follows, and is called clouds, or smoke. The smoke well coagulated with its feces becomes quick white; roast then the white ore that it may bring forth itself. When the blackness vanishes, the spirit is restored; for the spirit does not die, but rather quickens body and soul. The more perfectly our ore is purged, and subjected to coction, the better it becomes, till it is at length condensed into a Stone. But it must be dissolved again, and subjected to a powerful fire, until it looks like burnt blood. If this Stone be added to any substance, it tinges it into gold. The Sages speak of it as a kind of root. Take, they say, the whole virtue of the Tincture, and concentrate it in the Root. If a body which has no earthy elements receive this Tincture, it receives more benefit than less excellent bodies. The Stone overcomes everything to which it is applied, and tinges foreign bodies with its own colour. The dry fire tinges bodies, the air strengthens them, the white water washes away their blackness, and their earth receives the Tincture. Concerning the coction needed for the development of our substance, the Sages have expressed themselves in a great variety of ways. Observe Hermes, who says that it must be repeated again and again, until the red

colour at length is obtained. Herein is the stability of the whole work. Afterwards it assumes many, many colours, not including the red, which appears at the end. For the white must precede it. Set to work by the regimen of fire, and triturate. The above mentioned water volatilizes all bodies; even such as are gross it penetrates until it has assimilated them to its own nature. Know that unless you operate upon bodies until they are destroyed and their soul is extracted, with such you will never tinge any body, for nothing tinges which has not first itself been tinged. If the body be made fluid and burnt, then it bends itself towards its begetter, becoming a subtle Magnesia, and it turns towards the earth, which makes it spiritual and vivifies it. Before the final whiteness of the first stage is attained, the substance turns first of a black, then of an orange, and then of a reddish colour (which, however, is quite different from the final redness of the last stage). These colours, however, need not trouble you, since they are evanescent and merely transitional.

From what I have said you may gather that our substance is found in the gold which is hidden in Magnesia, and that it is *one* thing composed of sulphur from sulphur and mercury from mercury. And as the substance of our Stone is one, so is the method of its preparation. Therefore, do not listen to those ignorant and fraudulent alchemists who speak of many different kinds of sublimation and distillation. Turn a deaf ear to those who say that the substance of our Stone is the powder of the Basilisk. As to the (length of) time required for the preparation, you must begin it in the winter, which is moist, and extract the moisture until the spring, when all things become green, and when our substance, too, should exhibit a variety of colours. In the summer the substance should be reduced to powder by means of a powerful fire. The autumn, the season of ripeness, should witness its maturity, or final redness. About the motions of the stars or planets you need not trouble yourself. Our substance is a body containing the spirit which makes glass malleable, and turns crystals into carbuncles. One drop of our Elixir, as large as a drop of rain, will suffice to tinge and transmute a body a thousand times as large as itself

This most noble Remedy was appointed, like all other things, for the use of man, because he is the most glorious of God's creatures, and the lord of the whole earth. It was given to him for the purpose of preserving his youth, expelling disease, preventing suffering, and providing him with all he requires. Our Elixir is better than all the medicinal preparations of Hippocrates, Avicenna, and others. From it may be prepared a potable antidote which has power to cure leprosy. As fire purges and refines metals, so this Remedy restores to the human body its natural heat, expels from it all health-destroying matter, and fortifies it against every conceivable form of disease. Its virtue is infinitely greater than that of the potable gold dust, which is taken as a preventative among the Gentiles.

Great and wonderful is the potency of the gold that slumbers in Magnesia, both for the purifying of the human system, and for the transmuting of metals. What more shall I say? All the things that I have here faithfully described I have seen with my own eyes, and performed with my own hands.

When I was preparing the substance, after discovering the true method, I was so seriously interfered with by the persons with whom I lived that I was almost on the point of giving up the whole thing in despair. At length I communicated my discovery to a friend, who faithfully executed my instructions, and brought the work to a successful issue. For which Blessed Gift may God be praised, world without end. Amen.

**Altar of the Theraphic Brotherhood**  
**Fraternitatis Crucis Roseae**  
**Dedicated to the Assertion of the Fraternity of the Rosy Cross**

To the Reader,

Whoever has doubts about the Fraternity of the Rosy Cross, let him read this and having read the poem, he will be certain.

ANNO CHRISTI 1617

Written by a Brother of this Fraternity first in Latin, then translated into German and printed by I.S.N.P. & Poet Laureate

Printed at Neuenstadt by Johan Knuber 1618.

To the very Noble, Powerful and Honourable Balthasar von Schkoelen, Senior Master of the Horse of the Elector Prince of Saxony.

To the Honourable, Worshipful and Wise Ambrosius Becker, County Justice and Worshipful Mayor of Schkeunitz.

To the Honourable, Respected and Art loving Michael Stemplin, a Noble Erudite and noted Spagyric Expert.

To my high protectors and Young Lords, my Brother-in-law, and my trusty friends respectively, Luck, Blessing and Success.

Noble and powerful young Lord, kind and beloved Brother-in-law, well known and trusty friend, to you I send greetings first and my service, after that I dedicate and write these presents, which from outward appearance looks a short, little work, yet according to its secret meaning and hidden contents it is a very weighty and far looking work, and of the goodness and truth of my heart.

I trust they will receive and recognise it with a thankful mind and heart, read it with full attention, that they will think further over these matters, and wait with patience until something plainer, rounder, opener and more recognisable—as shall happen shortly, but then in Secret and in confidence—occurs.

Recommending myself to them jointly or severally as theirs for any service

Datum the 16th September Anno 1616.

at your service

Noble, Honourable, Powerful

also Honourable, Worshipful and Wise

Gentlemen.

I.S. N.P.P.C.

**ALTAR OF THE THERAPHIC TIE**

**F. X. R.**

**Fratris Christiani Rosencreutz**

People live in doubt every where  
If the highly honoured Fraternity  
of the Rosy Cross exist in truth  
which men declare to be so virtuous  
And the Fama is made ridiculous  
here and there as if it were a fairy tale.

The Fama I say declares one condition to the whole world.  
But whosoever likes to doubt matters clear as the Sun  
Is starblind at Midday  
No oculist can help him.

Note this, attentive and pious reader,  
What I tell you in one word  
I am a branch selected  
from the Highborn fraternity  
I tell you without guile  
In Germany our order exists in truth  
Right in the heart of the German Lands.  
And note it well, well known in foreign parts.

And although there are but few of us  
Until now, yet in these days  
And quite lately with pleasure  
The order has been extended  
By ten persons well known for their  
Understanding, honour, Art and virtue.

The Order has also at this present time  
Been newly and well reconstrued  
With many bye laws and statutes  
Which give it order, measure and object.

Could you see these, by your oath  
You would confess without hesitation  
That all and everything has been carefully  
Put into new form.

There are many who without pause or rest  
Endeavour and tireless try to come to our order,  
but by the nature of the thing,  
one does not easily reach one's heart's desires.

But many in their own mind  
cheat their own selves miserably.  
For our custom is of this kind

that we elect those who are known  
to us for a long time before,  
And who are proved full many a year  
who are their own masters and free  
Of body not bound to anyone.

Many strict conditions are to be found  
Which bind the Fratres of our Order  
Which are to be kept without exception  
Throughout your whole life.  
As a fellow a true friend,  
(Such are a thin crop in these days),  
may possibly be taken on  
So soon as he shows within him  
that he is worthy of such friendship,  
And is free from guile and tricks.

Listen, I will at this time  
Make round and clear yet another thing.  
A castle it is, a Castle fine  
Wherein the fraternal crown  
great in honour, rich in wonders  
has its lodging wonderfully.  
Which our father did erect  
And entrust to our fraternity  
and left it to them, as is known,  
Sancti Spiriti it has been called.  
But the length of time through many year  
Have however altered this name.  
In our documents, however, it remains  
The same as can be read therein.

In this cloister we live, I tell thee  
Dressed all alike,  
Yet are we not bound down  
to the yoke of the Pope of Rome  
As in former times we were  
Enveloped with that ill treatment.

Together with our well cared for acres  
We are surrounded by a green forest,  
A noble river quite clean  
Runs gently through our domain.  
Not far from us there exists  
A fine and farefamed City,  
Where we procure what we require

At any time that we desire.

In this place we live, believe me,  
in the enjoyment of freedom.  
The neighbours generally, round about  
Don't know who ever we can be,  
Many poor people daily and for ever  
Knock at our door desiring relief  
which we then send amply relieved away again.  
Whoever is troubled with disease  
and those whom evil fevers plague,  
All seek their refuge with us  
Those are helped quickly and at once

Wherefore the whole neighbourhood  
Is affected with loving kindness to us  
Loves and honours us, wishes us all good things  
And if a service can be rendered us  
it is done with joyous heart and willingly.

What more then can we now desire  
There is no man who intends or dares  
to hurt us in our bodies or goods;  
What more should we therefore desire  
That we would like better.

I nearly had told the place  
Where our order is concealed,  
But to tell that name now  
I have serious objections to.

In order that we have knowledge  
And news of all things in the order  
So that everything shall be free  
And unconcealed from any of us,  
We travel through all lands  
Unknown, now here, now there.

This is now my third voyage  
Which I have completed with zeal,  
Therefore have I rested a day finally in Hagenau.  
Because the rain without ceasing  
Has delayed me and the weather is wet  
Which has prevented me as aforesaid  
So that I could not get away.

Scarcely shall I complete within the space of a year  
my voyage which is prescribed to me,  
And how many countries and people do remain  
Which I have to visit yet  
In a little time and without vexation.

In the meantime it is not forgotten  
And is often done by me  
That I salute the order secretly  
By means of letters  
And communicate to them truthfully  
Many secret things frequently  
What I discover on my travels,  
That they know very soon.

And although we travel out and home  
Through foreign lands generally  
There is no host ever lived on earth  
Who received vexation and trouble  
One single time through us.  
We treat them well  
Pay for meat and meal and lodgings  
and what in such a case is fair and customary,  
Give them addition rich gifts;  
Wherefore as good friends  
We never are a burden to anybody.

The elder brethren of this order  
Have come to this agreement  
That the younger brethren henceforward  
Shall allow themselves to be used for this purpose  
But that their knapsacks are filled  
With rich and ample provender,  
Until they have in proper manner  
Deserved for troubles suffered and true diligence  
Their rest in the future.  
And have deservedly earned  
That for the rest of their lives  
They may live in peace without troubles.

We are anxiously desirous  
To study much more  
And daily to know much more  
Is our desire, wish and object  
If we find anything that is good anywhere  
Then we do it from that time

Note it, and make note of it.

Therefore nothing can happen  
In Germany at any time  
But we see it at once with our eyes.  
If any new books come out  
The Bookguide brings it to us at once,  
who is properly met for reward appointed to this office  
We treat honourably  
Manyfold Arts diligently  
With science, knowledge, art and handycraft  
We spend the rest of our time.

So that we may never be idle  
And stand in anybody's light  
We exercise ourselves at all times  
In the foreign languages of many lands.  
In Polish, Welsh, Spanish  
We all know how to talk  
In Italian and free Gallic  
And also in others whatsoever they may be (we can converse)  
There is no language throughout all lands  
Unknown to our Order.

Nature is assiduously examined  
Experience is highly valued  
What anyone in the fraternity  
Has newly, through his brain power,  
Discovered and studied  
He submits quickly to the Fratres  
Who examine these matters at once  
And amply weigh and value them.

We have in these times many things  
Which were invented by the Ancients  
Which we admit and experiment with  
And readily allow them to pass  
Which if rightly looked at  
Are hardly to be comprehended by human mind.  
At times also the inclination takes hold of me,  
When I can hardly help being idle,  
Idleness being a bad councillor  
So that I write Poetry,  
And in this enjoyment kill my time.,

Amongst us we maintain certainly

The due regulations without murmuring  
Our spirits inward and outwardly learn  
In peace and flame of love,  
One mind, one soul, one sense, one heart,  
One will, one opinion, one pain  
Are dwelling in us,  
Unity is our delight and most beautiful ornament.

Nobody knows anything but that forthwith  
The others know equally well  
Just as nobody owns anything particularly himself  
It is one heart, one sense, one council.

Our worthy overseer  
Then calls us together  
At certain hours and orders freely  
One after the other regularly  
To refer in *Mediem* (to practically try)  
What he has learnt in studying.  
As soon as that happens  
We do not all omit  
To consider the matter  
Now to argue *pro et contra*  
And what then is found correct  
Is entered at once into the Protocol (*Minute Book*)  
What is found false, as false is rejected.

Thus do we always proceed  
There everybody begins to tell  
What he in all his days  
Has heard, read, meditated  
All is truly referred.  
Then for love of our posterity  
All this is immediately also  
Entered with care into a Book.

What then pleases the Order  
The president (*praesul*) when it suits  
Knows how to use place, measure and time  
And sets a task now one or another  
That he do something and experiment (*laborier*)  
According as his known information (according to his ability)  
And qualification for the art  
Whom the Brethren altogether  
Counsel in many ways  
By (word of) mouth, with (helping) hand and good counsel

With assistance, science, and actual help (physical assistance)  
A library there stands  
With many thousand beautiful books.

No single trouble sorrowfull  
Is to be thought of in this world  
Which in the least could  
Trouble us anymore, nothing can be found  
That we should go short of here on earth  
God has given us plentifully  
With abundance what we lack  
No shortcomings are to be felt.  
On little do we live  
Well satisfied with some thing.  
Our bodies we cure  
According to nature properly.  
Therefore our health is good indeed  
And we live many a long year,  
Which creeps softly along like a tender rivulet  
Runs equally away on its course.

If it is required and necessity demands  
That we require money or goods  
For honours sake or necessity requires  
Then it is splendidly everywhere  
No dearth of Riches is here  
Of Power, pomp or reasonable adornment  
God give that every fellow  
Who hankers after temporary riches  
Knew thus to arrange matters  
in this world without guile or trick  
to do likewise when much honour  
would ensue to the fear of God  
And vice and shame would not  
be so plentiful in our fatherland.

God be praised,  
innocently we have to be blamed by evil tongues about many things  
by false hearts who charge us  
With things which never came into our minds.

What we began for the sake of the truth,  
That is explained in evil  
Therefore what we are charged with in evil  
We do not repay in evil  
But suffer patiently

In our heart and peacefully

He who accuses us of magic lately and without fear,  
and quite openly incriminated us  
and branded us with disgrace,  
That very pious man  
Does not himself know with whom he has to do.  
Truly he is in error absolutely  
And knows nothing at all about us.

But this I don't at all deny  
But grant it readily with all my heart  
That we naturally in many things  
Bring many a miracle into effect  
About which many an ignorant man  
May easily give many a thought  
As in chemistry many indeed proceed  
Without measure or object  
No day ever elapses  
Which does not see something in his fire (in his crucible)  
If he thinks that all this is done  
And not without the Devil's help,  
O God he is deceived  
And is in eternal error.  
For it is our care always that we together in common  
promulgate the honour of God  
Throughout the world in every place  
Serve God purely with hand and mouth  
Out of pureness of soul from the bottom of our hearts  
Full of the fear of God is our life  
Whom we to honour it is our duty  
To our neighbour our services are  
Openly ready now and evermore  
What more do you want dear Christian (brother)

Know that our College is an academy  
full of learning of God's word,  
what more do you want  
The time will yet arrive  
That it shall be hidden from no one  
In all this world what the power of God  
Has conceived by means of an order  
Amongst all people in every land.

The value of our order is recognised  
Be it about high and weighty matters

Which will call many to wonder greatly  
Whereof the stiffnecked world  
Shall be horror struck—as often declared,  
Out of our work it can be seen  
What benefit we have intended.

We are not lazy bellies  
Who are only trained to eat and drink  
We are no useless world plague  
Who lay themselves out for idleness  
But all our leisure is full of labour here and there  
Which labour serves to benefit  
The common weal for all his good  
And serves to your praise  
Lord Jesus Christ my saviour.

True it is and I cannot deny  
That many a false book is in print  
As if our society had published the same  
Which never came from us  
Nor would we dare to issue it.

A pious honest good man  
Can soon distinguish about these  
Who rightly considers our Reputation (Famam)  
And carefully bears in mind its sense

To say nothing about many an impudent clown  
Calls himself our Brother  
Whereas the unfortunate fool  
Widely differs from our Society

Such a deceiver a short while ago  
Has been found out at Nuremberg  
Who, amongst the common people  
Disseminated very many lies  
Until by reason of the truth  
he was in a very few hours convicted  
That he was a scoundrel and annant thief  
Who did nothing but brought misery on land and people  
Therefore on the gallows as he deserved  
His body became the food for the rooks.

In Augsburg also in the same way  
A landlouper was found out in flagrenti delictu  
And his back well paid for this

And the broom on his back he carried  
Out of the town as a reward  
And both his ears were cut off the head  
Of the wicked clown as a reward.

It serves them right all these fellows  
Who want to brag about the joint of meat  
Who have not tasted the Broth  
Such pay is proper for such tricks.

Here it is well also to bear in mind,  
Unfairly we are often thought of,  
That we do not make ourselves known  
And call ourselves after our first father,  
But his name clearly do not discover publicly,  
Indeed those altogether do us an injustice in this case  
Who say freely and without concealment  
That our name be only a dream.

You godless bumblebees do not err  
Your hive troubles us little  
Leave our Beehive undisturbed  
If you cannot please yourselves otherwise  
For your iniquity will be brought to light  
By us in a very short time

Therefore do not lightly believe  
What lyingly is painted to you  
Without you like to be made a fool of  
And deceived by false appearances  
And tell me this without wicked guile  
That in our days the world throughout  
Is dressed in the feathers of Lady Fraud  
Deceit, falsehood and wicked tricks reign now  
and every instant we find many Landswindlers.

Everybody pretends to know about us  
And lies and swindles without measure or number  
And all is ever invention alone

People hunt us very assiduously  
And many a question arises about it.  
The Jesuitical wicked crowd  
Invent many a hundred secret things  
That they may soon and above all  
Require to know of a surety

Where we might dwell  
Day and night they enquire about us.

In order to avoid their jaws  
And look well after our affairs  
And that our order does not become the prey  
Of these unmannerly wolves  
We have always to be careful  
And not make ourselves too public.

O holy and powerful God  
Save us from this wicked lot  
Cast down their godless impudence  
Keep our order in your protection  
If so be that you are pleased at this time with all our works,  
Turn away, turn away all our enemies  
Who have become wickedly wrath  
That they in no wise on us may  
Satisfy their great hatred

Protect the pious, Lord Jesus Christ  
Who art the refuge of us all  
For it is our wish all together  
To be known publicly  
To the world and the globe of the earth  
As God the best of witnesses knows

Oh that this in a short while may happen,  
How great would be our delight  
But if without end or finish  
Yet many obstacles be found  
We think the best counsel to be  
To keep as we are for a little while longer  
But in such a way that meanwhile  
We certainly make many more friends

Therefore we appeal to many a learned man in our writings  
With letters and by our own hands  
Although our names are not known,  
That is known to many a philosopher  
Many a chemist, many a Doctor  
Many a Reverend, many a worthy man  
Knows the sound of our trumpet.

Were I to let you know all  
And mention their names

O Eternal God, what a book  
would this indeed become  
Go now and doubt more  
Whether in untruth and dishonour  
Our free Brotherhood  
Really be in the nature of things

You must not make silly remarks  
The work itself will convince you  
What this noble brotherhood has  
Of might, of vitality, of power

But - where have I finally got to?  
I have almost gone too far  
Therefore that I do not not go beyond  
My object or say too much  
Or more than is permitted to me  
I will finish for this time  
And lay away my pen

Go be with you, and fare thee well

And now I beg kind permission  
What I have communicated to you this time  
If you do that and we get knowledge of you  
You will soon receive more.

*B.M.I. of the Fratres R.C. the least  
He wrote this during his third journey at Hagenau  
in which place he lay several days quietly, stopped by the rain.  
Done the 22 September Anno 1616.*

# An Anonymous Treatise Concerning the Philosopher's Stone

Therefore, my son, be fully warned against the sophistry of Alchemy and all sophisticating, deceitful people. Beware of them as you would beware of the devil who works mischief. Avoid them as an impure, pitiless, and consuming fire, even as a deadly poison, for a man comes to destruction of both body and soul, honour, goods, through this sophistry and self-insinuating false Alchemy. It is worse than the devil himself, for it is possible to expend (the wealth of) a whole kingdom thereon; yet everything is destroyed, and no fundamental truth is found out. Accordingly, open your eyes. Recognize the only key; avoid falsity, for it is impossible in any other way to obtain anything true or profitable, save in that way which I have now shewn in this book.

My noble and dear Son, in order that I may communicate to you, in the briefest manner, my knowledge of the right, true, philosophical Stone, now know and understand that this Stone is composed of two things, Body and Spirit, to wit, male and female seed, that is, Mercurial Water and Corpus Sols, as may be read in all philosophical works.

And it is the general opinion that Mercury --- free from foreign admixture --- should first be dissolved in a spiritual water, called by philosophers primary matter of metals, Liquor Lunae, Aqua Vitae, Quintessence, with which water, or primary matter, the metals are delivered and freed from their rigid, frozen bonds, and are dissolved into their primary nature, like mercurial water itself. Hence philosophers, in their books, have illustrated their meaning by saying that ice dissolves into water by means of heat, because it was water before its coagulation. For everything is reducible to its primary condition. Therefore, also, philosophers have written that the species or forms of metals cannot be changed into gold and silver before being first reduced to their primary matter.

With respect to this regeneration of metals, observe well, my son, that the same can take place by means of the primary matter of metals --- i.e., mercurial water alone, and through nothing else in the world. For this water has the greatest affinity to metallic nature, so that --- after equal mixture --- it can never be separated from the same.

Therefore have philosophers, in the *Turba* and other books, indicated this water, saying: Nature rejoices in Nature, Nature preserves, improves, unites with, reduces, and exalts Nature. Hence it is necessary to know how to prepare the Blessed Water, which water is a fiery penetrating spirit, a philosophical water, and the hidden key to this Art. For, verily, without this water all Alchemy is vain. Therefore, my son, remember that the whole Fundament of the Philosopher's Stone consists in bringing to a new birth the primary matter of metals --- i.e., Mercurial Water, the perfect Corpus Solis --- that it be born again by water and of the spirit, just as Christ says: "Except a man be born again by water and the Spirit, he cannot see the Kingdom of God". So also here in this art, I tell thee, my son: except Corpus Solis be sowed, all else is vain, and there will be no fruit. Even as Christ says: "except the Seed fall into the earth and die, it shall bear no fruit". When, now, Corpus Solis has been born again through water and the Spirit, it grows up a purified, astral, everlasting, immortal body, bringing much fruit and multiplying after the manner of vegetables.

Concerning this Roger Bacon says: I declare unto you that if the Astrum (Star) turn its inclination to, and impress it on, this clarified gold body, I can nevermore lose its virtue and power. For the body is perfect,

composed of, and agreeable to, all the elements. Therefore, my son, let him not attempt this Art who knows not of this new birth in nature, and this bringing forth of metals through the water and spirit of primary matter. For, believe me, all else is useless, vain, and deceiving. Hence philosophers have written that: “Everything brings forth its like; and what a man sows that shall he reap”.

Therefore says the Philosopher Richard, the Englishman: Sow gold and silver, that they, by means of Nature, may bring forth fruit.

Hence, my son, for thy work seek no other body but gold, as others are all imperfect. For gold is the most perfect of bodies, enlightening and vivifying all others, stable in fire, possessing a fixed, incombustible root; and, as Bacon testifies, one can alter nothing in the nobility and perfection of gold, it being free from all natural ferment, and no substance in the world is more perfect. Therefore, says Isaac the Philosopher: “The Stone can only be extracted from a perfect body, the most perfect in the world. For, were this body not perfect, how should we extract therefrom a Stone having power to give life to all mortal, to purify all corrupt, to soften all harden, and harden all soft bodies? Verily, it were impossible to extract to excellent a Stone from an imperfect body! Although many attempt it, yet they are fools”. Therefore, my son, understand that the red, philosophical, Sulphur is a gold, as Richard testifies, and King Calid also states: “Our Sulphur is no common Sulphur, but is of Mercurial nature, stable, fleeing no water”. Other Philosophers also bear witness that their Red Sulphur is gold.

Now, my son, the Sages say in their books that common gold and silver are not their gold or silver, since theirs are living, while the common are dead, and therefore incapable of imparting to others the perfection they themselves are wanting in. Now, my son, those words of the Philosophers are true; it is impossible for common gold or silver to perfect other imperfect bodies, except --- as I have said before --- the *Corpus Solis* and *Lunae* be born again through the Water and Spirit of Primary Matter, and arise as a transfigured, spiritual, clarified, externally fixed, subtle, penetrating body, which afterwards shall have power to perfect and multiply imperfect bodies. Therefore have our Philosophers said: For this reason are such labours undertaken on our Stone, that its tincture may be improved, for our Stone must be much more subtle and decocted than common gold and silver. Bernhardus says: “We therefore take this body as created by nature. But it is necessary to more than perfect the masculine body by natural art in order that in its more-than-perfection it may render the imperfect perfect, by its superabundant fertility in weight, colour, and substance. And, if its perfection were not greater in degree than that imparted by Nature, what use would our time of nine-and-a-half months be?”. Hence Arnoldus de Villa Nova, in his Epistle concerning our Stone, says: “The power and virtue and nature of gold and silver are in the Stone, else no gold or silver could be made. But the gold and silver in our Stone are better than the common, since the former are living. Hence Philosophers call the Stone their gold and silver, because the same are in it potentially and essentially, but not visibly”. Euclides says: “A perfect thing is unchangeable. For example, bread. Bread, baked and kneaded, is perfect in degree and nature, has attained its final form, and of it can be made nothing but bread. Thus also with philosophical gold. Hence it is impossible to perfect other bodies with common gold, except the perfect *Corpus Solis* be again dissolved into its primary matter, whereupon it is converted by our Art into a veritable Ferment or Tincture, philosophers saying the process is not finished until Sol and Luna are joined into one body. My son, understand here the *Luna Metaphorica*, not the literal, since philosophers explain Luna to be of a cold, moist nature, giving the same definition also to Mercury. Hence by Luna is understood Mercury, or Mercurial Water, or primary matter, which is the Philosophers’ Luna, or *Liquor Lunae* of the *Clangor Buccinae*.

Now, my son, you have a short explanation why it is impossible to do anything in this Art, except we reduce perfect bodies, by philosophical fire or mercurial water, to their primary nature, which primary nature is a Sulphureous Water, and not Quicksilver as Sophists assert. For the primary matter of metals is not Quicksilver, by a sticky, sulphureous steam, and a viscous water, in which water are united in the three principles, Salt, Sulphur, and Mercury. Therefore it is necessary to know the Blessed Water of Mercury, or celestial, supernatural fire, by which bodies are dissolved and fused. This knowledge is the greatest secret and is revealed by God alone. For the Philosopher Bacon says: God Almighty has created man above Nature and all creatures --- although man is of Nature, excepting the Breath of God breathed into him at the creation --- and he shall be the lord of Nature's works. This Divine Spirit fashions the mind and thoughts of man, teaching him to perceive the first principles of Nature. The inspired Apostle, St Peter, tells us that the Earth and its work shall consume therein, and a new world shall be born, beautiful and good, as is described in the Apocalypse. Thence the Philosopher concludes --- like St Peter --- that the elemental world can only be destroyed by fire. Therefore, remember in this Art that fire is the instrument, according to Nature's example, and, next, understand further that this water, whereby Corpus Solis (gold) --- which, as Roger Bacon testifies, is a world perfectly created --- is burnt, destroyed, and melted, is not a common fire -- since common fire can neither burn nor destroy gold --- but a supernatural, inconsumable fire, which alone has power to burn gold and release it from its hard, rigid bonds. Also, my son, understand that this supernatural fire, possessing such power over gold and other metallic bodies, is alone the spiritual, sulphureous, fiery water of Mercury, in which Corpus Solis is fused and burnt; and, out of this melting and destruction, is again born and created a new world, and the Heavenly Jerusalem, i.e., an eternal, clarified subtle, penetrating, stable body, which can penetrate and perfect all other bodies. Hence Bacon says: "Just as a supernatural or elemental fire is that which disintegrates and fuses the elements of the whole world, and as the new Creation will be born from the mortal, molten elements, and will be an eternal Creation; even so has the Holy Trinity in the Celestial Stone also revealed to us a supernatural fire. My son, philosophers in their books have concealed this Fire, describing it in parables, and by countless names; in particular, they call it Mary's Bath, and a horse-dung, Menstruum, Urine, Milk, Blood, Aqua Vitae, etc.". Concerning this Fire, Bernhardus says: "Make a vaporous fire, steady, digesting, not strong, subtle, airy, clear, condensed, inconsumable, penetrating, and equable". And he continues: "Verily, I tell thee, all wisdom is in this fire, for the said vaporous fire performs all things". Hence he directs us to copy his words concerning this fire, word for word. Therefore, a wise man will easily understand that such words refer not to a common, but to a supernatural fire. Hence Maria says: "The Element Water makes white and melts bodies". Concerning the preparation of this fire --- which he calls menstruum --- Raymundus Lullius says in his books (which are *Testam. Test. Noviss., Codicil, Anima Metallorum, Lux Mercuriorum, Liber Mercurius, Liber de Secretis Naturae, de Quintessentia*, and especially in *Elucidarium Testamenti*, Chap. 4: That it is not of men but of Angels to reveal this Celestial Fire, for therein is the greatest secret; and he indicates in figurative words that such Fire of the Sages is composed of horsedung and living chalk. What living chalk represents I will explain elsewhere. As to "horsedung", I have already indicated that it is the water of primary matter, for the same is warm and moist. But it is not common horsedung, as many ignorantly imagine. Therefore the Philosopher Alanus says: "Philosophers have named the moist fire horsedung, in which moisture is retained the latent heat; and it is the property of the fire in the horse's belly not to destroy gold, but to multiply it by reason of its moisture". Alchidonius says: "Verily our medicine is to be hidden in horsedung, which is the Sages' Fire". And Alanus: "Dear son, be diligent in disintegrating, and the same must take place in gentle heat, that is, in tepid horsedung". So also Arnold de Villa Nova, Chap. 9 (Concerning Heat), says that "the heat of horsedung is its fire". And Alphidius: "Let it be boiled and buried in the warmth of horsedung". Alos Aristiteles: "The Earth, or body, will rejoice in no strength unless sublimated by horsedung". Hermes: "Roast and boil it in the warmth of the horse's belly". And Morienus: "If thou find not

what thou seekest in horsedung, spare thyself further expense". Arnoldus: "And seek no other fire but this, for this is the Sages' Fire and Furnace. This water dissolves and calcines all metals, and fuses them white and red". Therefore say the Turba and Senior: Our water is the fire, and our water is stronger than all fire, making out of gold a pure spirit, which natural fire cannot do, although natural fire also belongs to it. For our water, penetrating the natural metal, converts it into primary water, and afterwards into an earth or powder, which burns gold more than natural fire. Hence gold more than natural fire. Hence Calid says: "It is verily a fire burning and destroying all things". But philosophers have concealed the preparation of this philosophical water or fire, i.e., Mercurial Water. Raymundus Lullius has written most plainly concerning the same: "And it will first be necessary to purify Mercury from its external moisture and earthy earthiness, but not with pernicious, destructive things, whereby its noble, fruitful, teeming nature would be destroyed". Avicenna, Arnold, Geber, Raymundus in the Codicil, and others, assert that Mercury is best purified by the sublimation of common, prepared salt. By treating the sublimate with hot water, the spirit of salt is dissolved out. Dry the sublimate, and mix with Tartaric Salt. Heat several times in a retort, when the Mercury will distill over vivified, and in this way will be somewhat freed from external moisture and impurities. This purgation, says Bernhardus, is not injurious, since the hot water and salt penetrate it not. But, my son, understand that Mercury cannot be thoroughly purified by external treatment, since it is a homogeneous, indivisible substance, "whose impurities penetrate its inmost being, and can therefore be removed by no sublimation". Hence another means must here be sought, viz., that of dissolving purified Quicksilver and loosing its natural bonds, and changing it into its primary, which is a sulphureous, spiritual water. Bacon and Raymundus Lullius both testify that unless purification and solution be effected, the menstruum will not be worth a fig.

When now Mercury is freed from its bond and resolved into its primary water, we can inwardly purify it, and, by distillation, separate the spirit from the water and earthy earthiness. Concerning which separation the philosophers have written mysteriously, and in particular have discovered the same figuratively in the distillation of wine. For in vinous distillation we see that the spirit of wine is mixed with much water and earthy impurity. But, by artificial distillation, the spirit can be separated from phlegmatic wateriness and earthy impurity, a residue remaining. From which residue, after calcinations, is extracted a white salt which --- added to the spirit, and repeatedly distilled --- produces a spirit mightily strengthened and sharpened by this salt of nitre. Verily the above is a figurative description given us by philosophers, which we should follow in the preparation of Mercurial Water. Since the same --- after disintegration and solution, i.e., similarly to wine --- can, by sublimation, be separated from the water or phlegm, rectified, etc. And, verily, no one has written more clearly concerning the preparation of his Mercurial Water than Raymund Lullius, viz., in *Test. Noviss.*, also in *Liber Mecurorium* (Test. I), etc., etc., in which he plainly enough declares that, after putrefaction, distillation, and separation of philosophical spirits of wine, the spiritual water is again mingled into its earth, and distilled over the alembic, further explaining how the said philosophical wine, or menstruum, is sharpened and strengthened with a salt.

This Water Menstruum, or philosophical spirits of wine, therefore, dissolves its own body, or animated Mercury, into the primary matter, or water, by which it can then be indefinitely multiplied with the help of putrefaction and distillation. Arnold de Villa Nova writes concerning this water thus: "There is a crumbling substance containing a fatty mixture, from which substance the master separates Philosophers' Liquid, which is suitable for the work and exceedingly clear. Therein dwells the Fifth Essence (Quintessence) Metallically, and the same has affinity to metals, and in it is the Tincture to be brought together, as being a perfect metal, for it has within itself the nature of Quicksilver and of Sulphur".

I will here (although forbidden) quote *Rosarium Philosophorum* concerning the distillation of this menstruum, or water: "In the distillation of the spirit care must be taken, and the vessels in which thou purifiest thy spirit must be of glass, that the spirit find not a place to flow out, by reason of its quickness. For if the Red Spirit escape, the Artist labours in vain. Artists call the Red Spirit a blood, and menstruum; therefore take heed with thy vessels that thou collect the dry spirit with its blood by itself in a receptacle, without diminution of its strength, so that thou mayst store up the same for future use". But, in distillation, seeing is more than writing. Hence nobody should be a master before having been a disciple. Therefore be careful in the work. Place a receptacle beneath, and distil first --- with gentle heat --- the element of water. Set the same aside, substituting another receptacle; close well the joints, that the spirit escape not, and increase the fire a little. Then will rise in the helmet, and distill over, a dry, yellow spirit; keep the fire steady while the helmet is yellow. Afterwards, when the helmet begins to get red, increase the fire slowly, and deep it so until the Red Spirit and the Blood have quite distilled out, passing through the helmet like clouds in the air. When the Red Spirit has distilled over, the helmet will become white. Then cease quickly, and thou hast in the receptacle the two elements, Air and Fire, and thus hast extracted the right dry spirit, and hast separated the pure from the impure. Behold, thou hast now the primary matter of metals, having thus separated the pure from the impure! Behold, thou hast now the water in which all metals have their origin, which is of all metals the root! Hence are they dissolved into water, even as frozen ice is resolved into water, since the same clearly was water in the first place. Therefore marvel not at this, for all things upon earth have their root in water. Oh, how many are there that, working, never think of this root, which is the key of the whole work? The same immediately dissolves bodies, is father and mother, opens out and locks up, and reduces bodies to their primary matter. It dissolves bodies, coagulating itself with them, and the Spirit of the Lord is led forth upon the Water, i.e., the strength of the spirit is seen to be active therein, and this takes place when the body is placed in this water. And the philosopher adds: "Behold the base thing with which our Sanctuary has been opened! For it is a thing well known by everyone; ye, he who understands it not finds it seldom or never. The wise man keeps it, the fool throws it away, and its reduction is easy to the initiated". But, my son, the freeing of this Stone, or Mercury, from its natural bonds, and its resolution into primary water, is the greatest and most secret of mysteries. And, without it, all else were vain, for we could not separate or extract the right spirit or Watery Essence that dissolves bodies. And this dissolving has been kept secret by all philosophers, and they have paced the revealing of the same in God's hand, and have cursed the man who should punish it. Hence they have spoken briefly and with subtlety of this resolution, that the same might remain hidden from the ignorant. But, thou, my son, observe that such resolution of Animated Mercury can hardly be effected without the proper means (coagulation). But, observe further, that here are not to be used sophisticated means, like those used by ignorant fools who, reducing common Mercury to water by sophisticated contrivances, vainly imagine they possess the true water. They sublime Mercury with all manner of corrosive salts and vitriols (whereby the sublimate generates Spirits of Salt), and, afterwards, dissolve the sublimate into water in a bath, cellar, and otherwise. They also make it into a water by means of Salmiac, herbs, soaps, aquafortis, with strange vessels, and such like sophisticated methods, which are, altogether, great phantasy, foolishness, and vanity; and then they imagine they can again separate such things from Mercurial Water, and thus obtain the true water desired of philosophers. But all is false, and they find not what they seek. And the cause of their failure is their neglect of the teaching of philosophers, who plainly declare that it should be mixed with no foreign matter. Bernhardus says in his Epistle: When Mercury is dried by Salt, Aquafortis, or other thing, it is no more suitable for philosophical work; for, dried by Salts, Alums, and Aquafortis, it dissolves not any more. But, thou, my son, remember what I now tell thee, and what philosophers have, in their books. Revealed to the understanding, that this water is to be prepared with no foreign matter in the world, but alone by Nature, with Nature, and out of Nature. These are to the understanding plain, clear words, which I will not in this

place explain more at length, but will embody them in a Treatise. Yet as an aid to memory give you the following verses:

Take it fresh, pure, living white and clear,  
Then bind firmly both hands and feet  
With the very strongest cords,  
That it suffocate and die.  
In the closed House of Putrefaction,  
According to nature's example,  
Let the same Nature dissolve it  
Into the same Nature dissolve it  
Into pure and beautiful primary matter.  
Then shall it be a living, spiritual Fount,  
Flowing from heaven pure and clear;  
Eating its own flesh and blood,  
Whereby it is multiplied.

He who, by Divine Aid, has attained this Blessed Water, let him praise God; for he holds in his hands the key with which he can unlock the treasure houses containing gold, silver, precious stones, honour, power, and health. This Blessed Water is by philosophers called Pluto's Daughter, having power over all treasures. She is also called the white, pure, tender, undefiled Virgin Bega, without whom no bringing forth nor mingling can take place. Therefore have philosophers married this pure, tender Virgin to Gabricus, that she might bear fruit; and Gabricus, having known her, died. Bega, by reason of her great love, swallowed and devoured her great love, swallowed and devoured him, as Aristotelese cleverly shews in Turba Philosophurum; and Bernhardus in his Practica says: "The fount is to the king as a mother, whom she bears within herself, and kills him. But the king rises again, and becomes so strong that no man can wound him". Hence philosophers say: "Although the king is, before the world, more precious and worthy than Bega, yet alone can he bear no fruit". This Virgin and Blessed Water have philosophers in their books called by a thousand names, as a Heaven, Celestial Water, Heavenly Rain, Heavenly or May Dew, Water of Paradise, Aqua Regia, Corrosive Aqua Fortis, a sharp vinegar and brandy, a Quintessence of Wine, a waxy green juice, a waxy Mercury, a water becoming green, and Green Lion, a Quicksilver, a Menstruum, a Blood and Mesntruum, urine and horse-urine, Milk, and Virgin's Milk, white *Arsenic*, Silver, a moon and a humour of the moon, a woman and woman's seed, a sulphureous, steamy water and smoke, a fiery burning spirit, a mortal penetrating poison, a basilisk which kills everything, an envenomed worm, a poisonous snake, a dragon, a poisonous serpent which devours its offspring, a strong fire, and a clear fire, a fire of horse dung and horse dung, a sharp salt and sal armoniac, a saltary and common salt, a sharp soap, lye, and viscous oil, an ostrich-stomach which devours and digests an eagle, a vulture and hermetic bird, a seal and vessel of Hermes, a smelting and calcining stove. Innumerable other names of beasts, birds, vegetables, waters, humours, of milk, of blood, and of men have been given to it. Philosophers have spoken of it in their books, moreover, in a figurative manner, that such a water should be made out of such things, and all the fools who have sought it in such things, have never found the desired water.

But, know this, my dearest son, that it is only made out of live Mercury, and from no other foreign thing in the world. The philosophers have given it these many names in order that the unwise may never know it. And you, my son, will have concluded the first part of this treatise, when you understand and know, that without this fire all the toil of the whole world and of alchemy is mere loss, and all alchemical processes are

a delusion, unprofitable and false. For the Great Rosary says: "The receipt consists of only one thing, and with this key all the books of the philosophers are particularly and universally closed, and surrounded and guarded as with a strong wall. He who has not yet acquired the key can never enter the fortified castle, or obtain anything profitable. For this water is the one only key for opening the metallic walls. Further, this water is the strong aquafortis which Isaac refers to in his fragmentary work, and wherewith he dissolved bodies and made them spiritual. Therefore, diligently note, all alchemical work without this is only lies and falsify, whether metallic, mineral, vegetable, or animal substances are used. It is dissolved, sublimated, distilled, calcinated, extracted, mixed, compounded, as one will. One may dissolve it in cellars, in the bath, in dung, in aquafortis, and in all manner of strong waters, in every possible way, as the alchemical processes direct. We may make oil, water, lime, powder, black, white, yellow, and red. We may burn it, we may melt it in any possible fashion, even as the alchemical receipts tell us, and call it the true means for making gold and silver, yet from beginning to end it is abomination and falsity. I myself, with my own hands (for once I disbelieved this), have experienced such loss and damage.

# AN EXCELLENT INTRODUCTION TO THE ART OF ALCHEMY

by Peter Bonus

## Table of the Contents of the Following Chapters

*Chapter I* --- The Matter of the Philosopher's Stone.

*Chapter II* --- Is Sulphur the Matter of the Stone?

*Chapter III* --- The Elements of the Stone and their Composition

*Chapter IV* --- The Ferment; Its Conditions, Properties, Conversions, etc.

*Chapter V* --- What is Theriac. And the Poison of the Stone

*Chapter VI* --- The Coagulum, the Milk, the Male and the Female of the Stone.

*Chapter VII* --- Analogy between the Generation of Gold, the Generation of Man, and the Germination of Grain.

*Chapter VIII* --- Solution of a Difficulty with Respect to Gold and Silver, which, it is said, cannot be elaborated from Iron and Bronze, by means of the Stone. Special attention should be paid to this solution, as it is of great importance.

Those chapters, with the arguments previously determined, are faithfully and diligently compiled from the treatise of master Peter Bonus, of Ferrara, a concordance of all ancient and modern Sages, forming an excellent introduction to the Art of Alchemy, By him it is named the *Precious New Pearl*.

Bonus tells us that as beginners we are apt to consider this an easy Art; but as we get to know more about it, we find that we were grievously mistaken in our first impression. On every side we are confronted with so many doubts, difficulties, and apparent contradictions, that we are apt to wonder, after a time, at the youthful rashness and foolhardiness with which we began the study. But in the following chapters we hope to set all difficulties at rest.

## *Chapter I.*

### **The Matter of the Philosopher's Stone. The Matter of the Metals, and its Causes, Properties, and Qualities.**

The great Geber tells us that metals are substantially composed of quicksilver and sulphur; though sulphur is their active principle rather than part of their substance. Their differences are generally traceable to a difference in the sulphur, which is found white, yellowish, red, saffron-coloured, green, and black, while the quicksilver, considered by itself, is always the same. Sometimes, indeed, the quicksilver has an earthy appearance, but this is owing to an admixture of lead, and can be remedied by a process of purification. Now, as sulphur, which is the proper coagulum of quicksilver, varies in its colour, while quicksilver is always white, it follows that the quicksilver receives its colour from the sulphur, and the sulphur causes the peculiar colour of the different metals. Everything else that is found in metals is more or less immature, and does not really belong to them. It should be noticed that, when metals are mixed, the quicksilver readily combines with quicksilver, because it is the same substance in all metals. But this cannot

be said of the sulphur, because it is not the same in all metals.

*Note.*

Hence, fixed sulphur retard the fusion and liquefaction in metals, and entirely prevents it where its quantity exceeds that of the quicksilver. The latter is the case in iron, and the said metal is, therefore, not fusible. This fact we are taught by experience, for when we desire to make fixed sulphur, we must calcine it, and that which is calcined is not susceptible of fusion. But sulphur which is not fixed accelerates fusion, as we see in the case of *arsenic*, which is of the nature of sulphur, and brings about the fusion of red-hot iron. That it is sulphur which prevents fusion, we see from the fact that when miners smelt ore, there ascends a sulphureous vapour before fusion takes place, and if we collect this substance in a vessel, it is found to resemble *orpiment*. But both its smell and its properties shew that it consists largely of sulphur. In the same way, fixed sulphur is said to be the cause of the hardness of metals, as we see in iron and brass. Therefore, also, sulphur, which is not fixed, on the other hand, is the cause of metallic softness, and of volatilization under the test of fire, as we see in lead and tin. But quicksilver, whether fixed or not, is the cause of metallic fusion. Whatever substances are fused with great difficulty are quickly coagulated (on account of the sulphur which they contain) and vice versa.

Sulphur easily adheres to iron and brass, and readily mingles with silver, which has a proportion of combustible sulphur, and also with lead, the latter because lead contains many parts of sulphur which is not fixed. It does not mingle well with tin because of the large quantity of quicksilver which the latter contains. With gold it does not mix at all, because gold is purged of all its sulphur. Quicksilver, on the other hand, enters gold very readily, as it also does silver, and --- in a lesser degree --- tin and lead, because of the large quantity of undigested quicksilver contained in them. Brass will receive it with difficulty, and iron not at all, except by an artifice. To tin it adheres on account of its undigested state, and on account of its large quantity of quicksilver. To gold it adheres most easily of all, because gold abounds in quicksilver. The fixed fusible quicksilver, then, is the cause of perfection in metals, and the less fixed it is, the further it is from perfection. Sulphur, on the other hand, whether fixed or volatile, is the cause of corruption and imperfection, so long as it remains in metals. Hence, we conclude that our noble Stone consists of quicksilver exclusively without any trace of external sulphur. This we see from the fact that quicksilver takes to nothing in the whole world more kindly than to gold; nothing, on the other hand, is more unlike gold than sulphur. Whoever denies that quicksilver is the true substance of metals, is like one who says that snow is not white. And because the Stone must enter the metals in all their parts, it is clear that it must consist entirely of quicksilver. Our assertion is borne out by the authority of Rhasis, Alphidius, and Geber. Rhasis, in his *Seventy Precepts*, affirms that Mercury is the root of all things, it only should be prepared, and from it is derived a good tincture, and a strong and conquering impression. Alphidius declares, on the evidence of all the Sages, that the work of wisdom consists solely in quicksilver. So also Geber says, in his chapter on the procreation of iron: Let us raise the Blessed, Glorious, and most High God, Who created quicksilver, and gave it a substance, and imparted to its substance properties which no other substance on earth can possess. It is the perfection of our Art, it is our victory which overcomes fire, and is not overcome by it, but delights in its heat, and gently and amicably reposes in it, etc. Though in his book on *The Coagulation of Mercury by Precipitation* he says that this medicine is elicited from metallic bodies with their sulphur and *arsenic*, he really means the same thing, but he expresses himself somewhat obscurely. We do not, however, need the testimony of the ancients to convince us that quicksilver without external sulphur must be the substance of the Stone, which, as has been said, is the form of gold. The fact is brought home to us with sufficient force by the evidence of our eyes, if, indeed, we have ever observed the facility and amicable readiness with

which quicksilver joins itself to gold.

*Query: Is Sulphur a material part of Gold and of our Stone?*

But it may be objected that our argument proves too much, and that sulphur must actually form a material part of gold and of the Stone of the Philosophers. If quicksilver must be the matter of the Stone, because it readily unites with gold, we may say with quite as much justice that sulphur must form part of this matter, because it very easily mingles with quicksilver, and especially because sulphur is the proper coagulum of quicksilver. If any one, says the philosopher Aristotle, would coagulate quicksilver so as to change it into gold or the Stone, he must do so by means of sulphur, for whenever sulphur is withdrawn from the quicksilver it becomes liquid as before; unless, therefore, the sulphur remain permanently with the quicksilver, it cannot become gold or the Stone. Moreover, quicksilver is white, and the Stone is universally admitted to be red --- hence sulphur must form part of its substance. Yet we answer as before, that quicksilver alone is the whole material cause, and the whole substance of the Stone.

You should, however, know that quicksilver in its first creation has many parts of an earthy, white, sulphureous matter mingled with it, which are most subtle and belong to its own material substance, and without which it would have no consistency. These particles cause first its white and then its red colour in the operation of the magistry. Thus Aristotle calls quicksilver a water mingled with a certain subtle sulphureous earth. A hint to the same effect is thrown out by Geber in his chapter on the nature of quicksilver. There is an inward sulphur as well as an outward, he tells us, and this internal sulphur forms part of the substance of the quicksilver, and is the true agent in coagulating it. At least, both are not fixed, and both are instrumental in coagulating the Mercury. But when the quicksilver with its own inward sulphur is mixed and coagulated, and has received from it either the white or red colour, then the external sulphur can no longer combine with it, because they have become dissimilar. Hence it may be urged that it cannot form part of the substance of our Stone.

Here we come upon the great secret of our Art, that quicksilver is coagulated, not by mixture with anything else, but is both coagulated and coloured into perfection by its own internal sulphur, while it is coloured and coagulated to corruption by external sulphur. If the quicksilver could be coagulated by any other substance, whether mineral, vegetable, or animal, it would be a foreign coagulum, and the coagulation would not be that which we require. We see, then, that this external sulphur, though it be active in metallic generation, cannot itself form part of the substance of our Stone; and the task before us is to get the quicksilver by itself, and to coagulate it without the contaminating influence of the outward sulphur, since that which generates cannot be part of the substance generated.

## *Chapter II.*

**Explains the Dictum of the Ancient Sages that "Sulphur alone is the matter of the Stone and of Gold".**

Those who superficially skim the writings of the sages might arrive at the conclusion that sulphur alone is the substance of our Stone. So Rosinus says that incombustible sulphur, which has prevailed against fire, is that which the Sages are in search of, and, elsewhere, that no tincture can be obtained except through pure

water of sulphur. Again, the precious colour of the philosophers is derived from sulphur. So, also, Solomon, the son of David, calls sulphur the Stone which God has placed above all other stones, which is prized by those who know it, and thought vile by the multitude. Bulus, in the *Turba Philosophorum*, asserts that the pure water is obtained from sulphur, yet not from one sulphur only, but from several things which make up one sulphur. And Anaxagoras exclaims: "Know that the perfection of this work is the water of sulphur".

To this question we, nevertheless, answer, as above, that the perfection of our Magistry consists in quicksilver alone, which contains in its composition dry sulphureous particles, which tinge and colour it white in actuality, and red in potentiality, and are that which gives to it perfection and form. But, as this internal sulphur cannot be active without some outward impulse, Nature has added to it, in all metallic ore, a certain external sulphur which stirs it into action. Our Magistry, of course, imitates Nature in this respect. Because of this inward sulphur, which coagulates the quicksilver, and forms part of it, and is unknown to the multitude, the ancient Sages have spoken of quicksilver as sulphur, and this hidden sulphur is made manifest in the Magistry of our Art by a grand artifice. Our sulphur, say they, is not the sulphur of the multitude, because common sulphur burns with a black smoke and is consumed; but the sulphur of the Sages burns with a white smoke and is perfected thereby. It is this sulphur which whitens and imparts the red colour, and coagulates and perfects the quicksilver into the substance gold in nature, and of the Philosopher's Stone in our Art.

It should be observed that, as everything is composed of matter and form, and is what it is by virtue of its form, a thing has the more being to more it possesses of the form. Quantity does not enter into the definition of form, since quantity and passivity belong to matter. When the substance is small in proportion of the form, there is much activity, much virtue, with great intensity of being, because there is proportionately much form. Concentrated force is more powerful than that which is divided. If this be so, we may say that, as the red luminous sulphur hidden in the quicksilver is the form of gold, it is that which tinges and transforms every kind of metal into gold. For this reason, the tincture is said to be derived rather from the quality and form, or sulphur, than from the quantity, or quicksilver. The intense redness thereof approaches black, or the colour of liver and of aloes, as declared in the Book of Three Words. Since one part of it tinges and forms a thousand parts of any metal into gold, according to the consensus of the philosophers, it must have much strength, a concentrated entity, and much form, or, rather, itself is the pure form of gold. Hence, on account of its redness, its operation can be extended to a great quantity of any kind of metal, so as to tinge and perfect it into gold. When the Stone is brought into loving contact with common metals, it purges away the external corrupting sulphur; thus they become white, and of the nature of pure quicksilver, and the form of gold being added to its substance, of course they become gold. This tincture, by means of which the perfecting process is brought about, is the sulphur of the Sages, the divine sulphur, and the Stone of the Philosophers, the secret sulphur with which all things are aureated and beautified. It is the precious substance which the sages call by so many mysterious names; the Shadow of the Sun, the coagulum of quicksilver, that which flies with tings flying and rest with things at rest, the gold of the philosophers, that which is sought of many and found of few, the Quintessence, the salt of armonia, the Vinegar of the Sages, the Golden Tree, of whose fruit whosoever eats shall not hunger again; that which is nourished and generated in the fire, and delights in it as in its native element; that which, like man, is a microcosm or little world. It is the second sulphur which is joined to the first sulphur, producing a third sulphur, of which it is said that sulphurs are contained in sulphurs.

*Note Concerning the Water and the Oil of Sulphur.*

The water of sulphur, or oil of sulphur, is quicksilver extracted from this composite sulphur. It is a living water, and that which the Sages call the Virgin's Milk, the pure, heavenly, and glorious water. It is sometimes referred to as the flying bird, which is substantially identical with the said sulphur, but diverse from the vulgar kind.

*Is Sulphur alone the whole material of Gold?*

Some have said that gold is a substance which is digested in the bowels of the earth out of a most pure orange-coloured sulphur alone, with an admixture of quicksilver just sufficient to give it brightness and malleability. But they say that gold receives from sulphur its substance, colour, fusibility, and all the rest of its proper accidents. We answer that the ancient sages had some good reason for connecting each of the seven metals with one of the seven planets, as the heavenly influence from which it derived its peculiar properties. Thus, lead was assigned to Saturn, tin to Jupiter, iron to Mars, gold to the Sun, copper to Venus, silver to the Moon. But to Mercury they assigned no metal, because only these six have attained to coagulation, with fusibility and malleability. In the seventh place, however, they did place mercury, not as a metal, but as the First Matter of all metals. If they had thought that this place belonged to sulphur, they would have associated sulphur, and not Mercury, with the seventh planet. Hence, it must be concluded that quicksilver, and not sulphur, is the origin, matter, and substance of metals.

The question now arises as to what Aristotle meant by refusing to identify the material of a thing with its form, as was done by the Platonist and the Pythagoreans. It is clear from his words that he did not take the meaning of the ancient Sages. The material of Alchemy --- the first matter, or chaos, according to the ancients, is that in which everything exists in a confused state, i.e., the quicksilver of the Sages in its primary condition, generated by a kind of preliminary digestion. This is the Stone which they seek, concealed from the senses, but manifested to the mind, the form and flower of gold. The knowledge of this material is more important than anything else in Alchemy. For it opens up the knowledge of all other causes, properties, and conditions, and, finally, of the form itself. But if we do not know the right material, it is simply impossible for us to know anything about it. Hence, this question: What is the material? --- must be the first problem solved by the student of Alchemy.

This material is, of course, by its very nature, disposed to receive its own proper form, just as the grain of wheat has in it the disposition to become wheat. Thus, if we define matter as that in which the form inheres, there is, after all, not so much difference between material and form, but that, in our Art, at least, we may confidently identify them. There could be no such thing as a substantial form, if there were no material possessing a capacity of being developed in a certain direction. If anyone, then, would know the form of gold, he must first know the material of the Stone. Hence, we see that real insight into the nature of a thing depends on an accurate knowledge of its material.

### *Chapter III.*

**We must now proceed to enquire what are the Elements of the Stone, and how they are the same in Gold as in all Composite Substances, not only on Earth, but also in the Heavens.**

We affirm that all elements of the Stone must be first purified, and then evenly mixed in the right proportions, so that the resultant compound may be permanent. Hence it is necessary to say something about the elements. There are many persons at the present day, even as there were some in the past, and will be others in the future, so long as investigators abide by the literal words of the Sages, who know not the meaning of our Art, and are endeavoring to extract the Philosopher's Stone from all sorts of fantastic animal and vegetable substances. These substances they have subjected to all the processes described in our orthodox treatises. And have obtained in the end something white, and something red, which, however, have none of the blessed properties of our Stone. These persons do not know that every form must be extracted from that proximate matter in which it is potentially contained; that is to say, the material and the form must both belong to the same natural genus. If we wish to understand the nature of a man, we shall not waste our time in studying the essential properties of a tree or of a stone; for them we should never get beyond these substances, which, however interesting in themselves, are quite foreign to our subject. Alchemy sets itself to transmute metals into gold; hence we must study the essential properties of gold and of the other metals, and we must look for our first substance among metals, and not in the animal or vegetable world. Know, then, that a knowledge of the essence and nature of a thing is obtained from a knowledge of its first principles, or proximate causes. We cannot understand the changes of bodies, or even of quicksilver itself, if we have no radical knowledge of its essential properties. The principles of being and of knowing, says Aristotle, are the same --- as things are, so they must also be understood and known. If we understand the substance of our Stone as it is, there is nothing left to study but the method of treatment, and this method will be suggested by the knowledge we already possess.

Every compound consists of a mixture of four elements, two of which are enclosed, viz., fire and air, while two enclose them, viz., earth and water, whence we see that in every composite there is a superabundance of earth and water. Fire and air are the formal and moving principles, the two others are the material and passive principles. The virtue of fire and air can appear only in the earth and water, as the virtue of the form can appear only in the substance. For even as the form is included or hidden in the matter, so are fire and air included in earth and water. Rhasis calls fire and air the occult, water and earth the manifest principles of a compound. Since, then, the strong are enclosed by the weak, the compound is easily corrupted, and the formal principles by their exhalation give to the others form, colour, taste, smell, etc.; but so long as the material principles remain, they are not wholly deserted by the formal. If, on the other hand, the compound is not easily destroyed, it is on account of the strength of the enclosing principles. If both are weak, the whole compound is very perishable, e.g., camphor. If both are equally strong, even smallest part of the compound coheres in a permanent union with every other. When the humid and the dry, and the hot and the cold, are so evenly balanced that there is an equilibrium of the elements, they are perfectly united, and the compound is indestructible.

The elements of our Art, then, are the humid and the dry, i.e., water and earth. In water there is enclosed air, and in earth fire. But the radical element from which all others are derived, is humidity, or water, that is, liquefaction, or, according to others, earth. We may reconcile the two views by stating, on the authority of Empedocles, that when water is thickened, it becomes earth: earth floats upon the waters, and is founded upon the waters, as we learn from Morienus and Hermes. When wax is in a liquid state, it is like water; when it becomes coagulated, it is dry, like earth; and yet its weight is the same in both cases. Alexander sets forth, in his *Epistle*, that all the Philosophers apply the name of fire to everything that is hot, of water to all that is flexible, and of earth or stone to whatsoever is coagulated. But neither water nor any other element by itself is of much use to us in this Art. They must all be first separated and severally purified, and then recombined in even proportions --- that is to say, when the water has been purified, we must add to it the

purified earth, and then we shall have all the four indissolubly united, and the work will be perfect. If they are not so united, the fire resolves the water into steam, together with the earth, and the whole compound perishes. If, then, you would succeed in mixing elements, you must know their nature and properties. Convert the elements, says Alexander; make the humid dry, and the volatile fixed, and you have what you seek. Know that, then, all elements are actually converted into earth, and the other elements are, and remain, with it potentially and virtually. Hence, Hermes says that earth is the element out of which everything is made, and into which everything is converted. In the composition of the Stone and of gold we have a perfect equation of the elements. This well-tempered substance can neither be destroyed by the violence of the fire, nor vitiated by the impurity of the earth, nor spoiled by an excess of water or air. The Stone and gold are thus generated in the fire, and, like everything else, flourish in their native element. They are, therefore, indestructible by fire, and are rather perfected and improved by it than otherwise.

These remarks, in the opinion of the ancient Sages, had a direct bearing upon the constitution of the heavenly bodies. They, like the Philosopher's Stone, are composed of such an evenly balanced mixture of the elements as to be indestructible. The active and passive elements are so accurately matched in their composition that the formal cannot be separated from the material principles. Hence, Nature has placed nearest to them the sphere of fire, which conserves rather than destroys them. For elementary fire is related to the heavenly bodies as material fire is related to gold and our Stone. It is through this wise natural arrangement that the heavenly bodies may be said to be practically indestructible and eternal.

There are, then, four elements, by reason of the four primary qualities; and they are mutually convertible, because every one is potentially in every other, and they are constantly generating and destroying each other. In substance, there is from the beginning of the world only one element, or First Matter, out of the conflicting qualities of which the four elements are generated by division. Similarly, there are in the first substance of this Stone four elements potentially, which by our Art are separated, and then again combined. Moreover, we believe our Stone to be incorruptible, not only through the equation of its elements, but also through the addition to it to the fifth element, just as the great world is composed of four corruptible elements, and an incorruptible one, which is the quintessence. It is this quintessence which, in the small world of our Art, holds the four elements together in indissoluble union, which also, according to Alexander, is neither hot nor cold, neither moist nor dry. This soul of our Art is the divine incorruptible sulphur. Other elements are the body, soul, and spirit, the dry and the humid, the fixed and the volatile, the white and the red. As of all the elements earth alone is fixed, and as the elements at the end of our Magistry must become fixed, it is clear that they must all be converted into earth, or the fixed state of the philosophers.

#### *Chapter IV.*

##### **Of the Ferment, and the Modes, Conditions, Properties, and Conversion brought about by it.**

Of the ferment, which is the great secret of our Art, and without which it cannot attain its goal, the Sages speak only in the very obscurest terms. They seem to use the word in two senses, meaning either the elements of the Stone itself, or that which perfects and completes the Stone. In the first sense our Stone is the leaven of all other metals, and changes them into its own nature --- a small piece of leaven leavening a whole lump. As leaven, though of the same nature with dough, cannot raise it, until, from being dough, it

has received a new quality which it did not possess before, so our Stone cannot change metals, until it is changed itself, and has added to it a certain virtue which it did not possess before. It cannot change, or colour, unless it have first itself been changed and coloured, as we learn from the *Turba Philosophorum*. Ordinary leaven receives its fermenting power through the digestive virtue of gentle and hidden heat; and so our Stone is rendered capable of fermenting, converting, and altering metals by means of a certain digestive heat, which bring out its potential and latent properties, seeing that without heat, as Theophrastus tells us, neither digestion, operation, nor motion are possible. The difference between ordinary leaven and our ferment is that common leaven loses nothing of its substance in the digestive process, while digestion removes from our ferment all that is superfluous, impure, and corruptive, as is done by Nature in the preparation of gold. It is because our ferment assimilates all metals to itself, just as common leaven assimilates to itself the whole mass of dough, that it has received this name from the Sages. Hence it appears that quicksilver (being of the same substance with the metals), when fermented and changed into the same substance as the ferment, transmutes into its own nature every fusible substance of its own kind, and, as its nature is that of gold, it converts all metals into gold.

It is true the action of this ferment is not quite analogous to that of leaven. For leaven changes the whole lump of dough into a kind of leaven; but our Stone, instead of converting metals into the Tincture, transmutes them only into gold. Our Stone rather changes all metals into a kind of intermediate substance, such as is the substance of gold, between that which they were before and the alternative ferment. The colour, too, of gold is intermediate between the blackness of iron, the redness of copper, the livid grey of lead, and the whiteness of silver. The degree of digestion which is obtained is also intermediate between that of copper and iron on the one hand, and that of tin and lead on the other. Its fusibility further represents the golden mean, since copper is melted with difficulty, iron with more difficulty, while tin and lead are melted with the greatest ease, and silver and gold not so readily as the latter, but more readily than the former. The same intermediate quality of gold is noticeable also in its ring, that of lead and tin being dull, and that of silver and gold moderately clear. To this middle state all metals are reduced by our Stone. For, though the virtue of our Stone is great, yet, on being mixed with common metals, its action is slightly affected by their impurity, and does not change them quite into its own likeness, but only into gold.

More difficult is the second sense of the ferment, which is the truly philosophical ferment, and wherein is the whole difficulty of our Art, for in this sense it signifies that which perfects our Stone. The word ferment is derived from a root which denotes seething or bubbling, because it makes the dough rise and swell, and has a hidden dominant quality which prevails to change the dough into its own nature, rectifying and reducing it to a better and nobler state. It is composed of divers hidden virtues inherent in one substance. In the same way that ferment which is mixed with our quicksilver makes it rise and swell, and prevails to assimilate it to its own nature, thus exalting it into a nobler condition. In itself quicksilver has no active virtue, but if it be mortified together with this ferment it remains joined to it forever, and is thenceforward changed into the nature of the Sun, the whole being developed into ferment, which in turn develops all things into gold.

The ferment of which we speak is invisible to the eye, but capable of being apprehended by the mind. It is the body which retains the soul, and the soul can shew its power only when it is united to the body. Therefore, when the Artist sees the white soul arise, he should join it to its body in the very same instant; for no soul can be retained without its body. This union takes place through the mediation of the spirit, for the soul cannot abide in the body except through the spirit, which gives permanence to their union, and this conjunction is the end of the work. Now, the body is nothing new or foreign; only that which was before

hidden becomes manifest, and vice versa. The body is stronger than soul and spirit, and if we are to retain them, we must do so by means of the body, as the *Turba* and Plato agree. Without this hidden spiritual body the Stone can neither ferment nor be perfected. Of course, the body, soul, and spirit of pure Stone are only different aspect of the same thing, and according to these aspects the Sages call it now by one name, and now by another. The soul, says Plato, must be reunited to its own body, or else you will fail, because the soul will escape you. And Hermes insists that it must be its own original body, and not one of an extraneous or alien nature, as attempted by some who are ignorant of this Arcanum. Rhasis says that the body is the form, and the spirit the matter; and rightly, because as no substance can exist without form, which is its real being, so the soul, through the mediation of the spirit, cannot be in the Stone except by the body, because its being and perfection depend on the body. Hence, the body is their bond and form, though they are the same thing. As that which imparts its form to the Stone and to gold, is something fixed, and a body, while Mercury is that which receives fixation and a form, it follows that the body is the form.

The body, then, is that which is the form, and the ferment, and the perfection, and the Tincture of which the Sages are in search. It is also the Sol and gold of the philosophers. It is white actually and red potentially; while it is white it is still imperfect, but it is perfected when it becomes red. The Sun, says Rosinus, is white in appearance, and red by development. Anaxagoras teaches that the Sun is an ardent red, but the soul to which the Sun is united by the bond of the spirit is white, being of the nature of the Moon, and is called the quicksilver of the philosophers. Hermes tells us that without the Red Stone there can be no true Tincture. The red slave, says Rhasis, has wedded a white spouse. We now see the truth of the saying that there are two kinds of gold, one white and one red; but the one must be in the other. This white gold is, according to Rhasis, a neutral body, which is neither in sickness nor in health, and it is, of course, quicksilver. Geber says that no metal is submerged in it except gold, which is the medium of conjunction between the tinctures. That it is the true ferment, Hermes tells us in his seventh book, when he says: Note, that the ferment whitens the compound, prevents combustion, holds the tincture together, and makes them enter each other and remain in union, etc. So also Morienus affirms that the ferment of gold is gold, as the ferment of dough is dough.

From these considerations we see clearly how silver and gold are of the same nature, and that silver precedes gold, and is predisposed to gold, while gold is hidden in silver, and is extracted from its womb. Hence, Senior says that the rising sun is in the waxing moon. Know, ye students of this Art, cries Zeno in the *Turba Philosophorum*, that unless you first make it white, you will not be able to make it red, because the white potentially contains the red. If there be too little gold in the compound, says Dardanus, the Tincture will be brilliantly white. Alphidius says: Know that the dealbation must come first, for it is the beginning of the whole work, and then the rubefaction must follow, which is the perfection of the whole work. Since the entire substance, viz., the soul united to the body by the spirit, is of the pure nature of gold, it is clear that whatever it converts, it must convert into gold. At first, indeed, the whole mass is white, because quicksilver predominates; but because gold is dominant, though hidden, in it, when it is ferment, the mass in the second stage of our Magistry becomes red in the fullness of the potential sense, while in the third stage, or the second and last decoction, the ferment is actively dominated, and the red colour becomes manifest, and possesses the whole substance. Again, we say that this ferment is that strong substance which turns everything into its own nature. Our ferment is of the same substance of gold; gold is of quicksilver, and our design is to produce gold.

The Ancients gave the name of body to whatsoever is fixed and resists the action of heat; moreover, it has the power of retaining in a compound that which is essentially incorporeal and volatile, and attempts to

volatilize the body, viz., the soul. Spirit they called that which constitutes the bond between body and soul, and, by abiding with the body, compels the soul to return to it. And yet, body, soul, and spirit are not three things, but different aspects of the same thing. As bond between body and soul, the spirit is said to prevail during the Magistry from beginning to end; so long as the substance is volatile and flees from the fire, it is called soul; when it becomes able to resist the action of the fire, it is called body. The force of the body should prevail over the force of the soul, and instead of the body being carried upward with the soul, the soul remains with the body, the work is crowned with success, and the spirit will bind with the two in indissoluble union forever. Since, then, the body perfects and retains the soul, and imparts real being to it and the whole work, while the soul manifests its power in this body, and all this is accomplished through the mediation of the spirit, it has been well said that the body and the form are one and the same thing, the other two being called the substance.

But how are we to understand Plato's remark that he who has once performed this work need not repeat it, as his fortune is made forever? The words do not mean that he who has once prepared the Tincture can multiply its quantity indefinitely, just as he who has once struck a fire out of a stone can always keep himself provided with fire simply by adding fuel to it. The authority of Plato is supported by that of Rhasis, who speaks in a similar fashion. They should be interpreted, however, not according to the letter, but according to the spirit. He who has once succeeded in preparing this Medicine need not any more go through the experience of his failures and mistakes: he now knows how to perform all the processes of our Magistry properly, and, therefore, if ever he should need a fresh supply of the Medicine, he will be able to provide himself with it without much trouble.

When the Alchemist, in the course of course of his decoction and putrefaction, has reached the end of the first part of our Magistry, in which is seen the simple white colour, before the appearance of any other colours, then he must straightway set about the second part of the work, and this second part is the ferment and the fermentation of the substance. Then, if all elements are evenly combined without being touched by hand, the artist is a rich man, and has no need, thenceforth, in repeating the work, to repeat all his former mistakes. But, if he does not combine the elements evenly, the whole substance will vanish into thin air, and the Alchemist will have lost his hoped-for riches. If, says Haly, you do not find this Stone, when it germinates, no other will arise in its place. Beware, says Plato, lest in the fermentation you come to a bitter end. If there be any hindrance or obstacle in the solution, there will most likely be corruption in the augmenting. The right moment must be seized here, as in all other things. When you are baking bread or sweetmeats, or any other solid substance, the moment will arise when they are perfectly done; and if after that moment you leave them in the oven ever so short a time, they will be marred, burnt, and destroyed. Haly compares the preparation of our Stone to that of soap, which is spoiled if boiled beyond a certain point. Hence the artist must be extremely watchful, and as soon as the substance has reached its most subtle stage, he must put an end to the digestive process; if he pushes it any further, the combined forces of the fire and the volatile part of the substance overcome its fixed part, and the whole evaporated. He who knows how to pacify and assuage the hostility of the elements will be successful in our Magistry, but no other.

The object of what has been said is to shew that at the close of the perfect decoction and putrefaction, Nature, by the ministration of our Art, generates a bare simple matter, not united to its form; this matter the Ancients called first matter, on account of its resemblance to the first matter of the world, before it received its form. This matter needs to be united to its form, which form is the ferment, and is hidden in its womb. This conjunction must take place immediately the matter is born; the same will then become durable and imperishable. Nature, unassisted, cannot effect this union, because it is irrational, and its operations go on

forever in successive renovation and destruction; but the Artist can watch the proper moment, and preserve that which the fire has generated. Now, when the conjunction has taken place, the substance has nothing more to fear from the fire. If one only knows the right moment, the conjunction is a very easy process; and when it takes place, there are many wonderful phenomena, as Morienus testifies. It is brought about by a well-tempered fire, the action of which is stopped by a watchful artist. And this conjunction accomplished, it is open to the artist to rest. Socrates, in the *Turba Philosophorum*, says that what follows is woman's work and child's play. Rhasis says that nothing but vigilance is requisite, for as the ablution and depuration of the elements are accomplished by the presence of fire, so are the conjunction, perpetuation, and fermentation of the purified matters performed in the absence of fire.

### *Concerning the Time of Fermentation*

It should further be noticed that the time for fermenting the substance is the moment when the Stone germinates, germination being the revival of a seed after apparent death. The quicksilver first melts through the digestive action of the fire, and then is coagulated with its ferment or body: this process is that which we call germination. What a man sows, says Rhasis, that shall he also reap. Seeds can only spring up after their kind, and bear fruit after their kind. So minerals do not become something else, but return to that from which they arose.

Yet, how can Nature generate a simple substance not united to its form? This is, nevertheless, a fact according to the Ancients, but in a metaphorical sense. Aristotle says that as the reason comes to a man from without, so the vegetative and sensitive soul comes from within. There is in seed the soul and the body, but there is added to it from without the rational spirit. In the same way we are to understand the metaphorical dicta in our Art.

Again, the action of heat in itself is not determined in any particular direction, or towards any particular end; but for the attainment of any such purpose it has to be used and regulated by an intelligent mind. When I say heat, I mean the elementary fire which is generated in all things, both animals, and vegetables, and metals. This natural fire, without which there is neither growth nor generation, is the instrument of the mind, and is regulated by the Artist, in respect of quantity, quality, and time, for the attainment of a certain well-defined end. If the heat be continued beyond a certain point, the form which it had generated is again destroyed. The action of fire in itself only tends to combustion, but man may regulate it so as to effect many other objects. Hence, Pythagoras says that man is the measure of all things. Nature is blind and its action indefinite; it follows all the influences which are brought to bear on it, in this or in that direction; but the will of man is free, and can regulate and modify the working of Nature so as to bring about its own ends. If the will of man follow Nature, Nature will go beyond the proper point, and spoil everything.

The object of Nature in all things is to introduce into each substance the form which properly belongs to it; and this is also the design of our Art. When, therefore, the quicksilver of the Sages has been generated by the skill and wisdom of the artist, the form must be added to it, and then the work stopped at once, since its end is reached, and anything more can only spoil it.

If the Mercury were coagulated by some foreign (non-metallic) substance, it would not be of the slightest use, since in Nature only homogeneous things will combine. The coagulation by means of *arsenic* and common sulphur, though they are mineral substances, tends only to corruption.

## *Chapter V.*

### **What is Theriac, and What is Called the Poison in the Philosopher's Stone?**

The Ancients have mentioned, as component parts of this Stone, theriac and poison. Like the ferment, they are either the perfect Stone, or that which perfects it. In the first sense it is improperly, in the second more properly, so-called. Because theriac has remarkable cleansing properties, and poison possess considerable medicinal virtues, they may mean the Stone, which cleanses common metals from all impurities, and converts them into gold. The four corrupt metals suffer from four different kinds of leprosy, and therefore, each needs this poison for its cure. Iron is infected with leprosy from corruption of the bile, tin from corruption of the phlegm, and lead from simple melancholic corruption, which is also called elephantiasis. All these corruptions are due to the presence of impure sulphur, which is removed by our poison, or washed away by means of our theriac. Silver suffers from a phlegmatic leprosy, because it contains a proportion of combustible sulphur. But wise Nature in the generation thereof has combined a certain theriac therein, and when the sulphur has been purged of by the Stone, gold immediately results. Gold alone is free from impurity and is perfectly healthy, like pure blood in a sound body. In its correct sense, theriac or poison is that which is properly called ferment. If the Artist stops at the right moment, all will be well; otherwise, the process of fermentation will go too far, and everything will be spoiled. Hence Hamec says that at this stage the ferment may become poison, and the Artist must very carefully beware of its smell, for, if he inhale it, it will prove fatal to him. He means to say that if it be allowed to evaporate, the Artist will be ruined. This Stone, says Morienus, heals the infirmities of metals, as theriac cures the diseases of the human body; hence it is sometimes called poison, on account of its medicinal use.

*Note: --- Of the Union of Soul and Body with their Spirit.*

At the close of our Magistry, when the soul seeks its body, we should see that it is able to unite itself to it, and receive life and activity. This union and composition take place through the operation of the spirit. When the soul is united to the body, it lives with its body forever. The conjunction occurs at the moment of the soul's resurrection: for, though it existed before, yet it could not manifest itself in the body, on account of the defilement and impurity of the body. Hence it lays like a thing dead and useless, and, as it were, buried with its body. But when it is purified and made white by means of our Magistry, it rises clean and white, and finds the body from which it had been separated also clean and pure, and so it seeks its body, and longs to be united with it, in order that it may live for ever: for it cannot be united to a strange body. If, therefore, the Artist does not take care, it will seek to escape with its body, and carry it upward, when the whole work will be annihilated, and the end of the experiment made void. Hence the body is called the theriac of its soul when the soul is saved by it and is beatified with it; it is called poison when it is the cause of the eternal death of the soul, through a failure in conjunction by reason of the Artist's folly. But if he seizes the right moment to stop the heat, the union is perfected and is rendered indissoluble. In this conjunction the body is spiritual, like the soul itself. Thus they unite, as water unites with water, and body, soul, and spirit are now the same thing, nor can they be separated for ever. Because of the insight which their Art gave to them, the Ancient Sages knew all about the resurrection of the body and the redeeming work of Jesus Christ, as also about the Trinity in Unity, and all the other verities of our faith. I am firmly persuaded that any unbeliever who got truly to know this Art, would straightway confess the truth of our Blessed Religion, and believe in the trinity and in our Lord Jesus Christ. Such was the experience of

Hermes, Plato, and other ancient Sages.

But we will now return to the point. We were speaking of theriac and poison. When this Stone is born in the coction, it is in the likeness of brilliantly white quicksilver, and is called the quicksilver of the sages. This quicksilver, to be of any utility, must be joined to its body and mortified; it is killed by its body, and therefore the body may be called poison, in the second and proper sense. And as this death tends to healing and glorious restoration, it is, in the same way, designated theriac. So it is with men: death is the means of giving to them a more glorious life. Our poison, or theriac, is thus identical with the above-mentioned ferment, and is the key of the whole work, the form of the Sun, and the flower of gold. Hence it is advanced by Seno, in the *Turba Philosophorum*, that no body is more precious and pure than the Sun, and that no tinging poison can be generated without the Sun and its shadow; whoever thinks otherwise errs grievously, but he who tinges the poison of the Wise by the Sun and its shadow, the same attains unto the great Arcanum. Without this theriac and poison our Magistry cannot be accomplished; though, of course, they are not added from without, but form an integral part of our substance.

## *Chapter VI.*

### **The Coagulum and the Milk in the Philosopher's Stone, and its Male and Female Agents.**

The terms used in the superscription are some of the most secret phrases of our Art, and if we do not know their meaning, we know nothing about Alchemy. Some suppose that this Stone, when perfect, is related to Mercury, as a coagulating substance to milk. For, as a moderate quantity of a coagulum clots a large quantity of milk, so a small particle of this Stone, when projected upon many parts of Mercury, converts them into silver or gold. This view, however, is a great mistake. If it were true, of what use would the Stone be for the conversion of metals which are already coagulated by Nature?

We say that the coagulation of the Sages is that which, in the preceding chapters, has been called the ferment, or the body, or the poison, or the flower of gold, which is hidden in the Mercury of the Sages when it arises, and that Mercury is called the Milk. The coagulum is that which coagulates the mercury, and the two are one and the same in substance, i.e, Mercury coagulates itself, and is not coagulated by any foreign substance, as you may also see in the case of wax when it is coagulated. Moreover, as coagulum is made of milk alone, but receives the power of coagulation by means of a certain digestion and decoction, so this coagulum which arises in the Mercury of the Philosophers by means of certain digestion and decoction, receives power to coagulate the mercury in which it is; and as the coagulum changes a large quantity of milk into its own nature, so it is with the coagulum of Mercury and its substance. Mercury, thus coagulated, is no longer volatile, but has become the gold of the Sages, and their poison.

Know that this coagulum is the Key of the Sages, because when it coagulates the spirit, it at the same time dissolves the body, the coagulation of the spirit and the solution of the body being the same thing, whence the philosophers have laid down that the spirits cannot be contained except with the waters of their bodies. Our gum coagulates our milk, says Rhasis, and our milk dissolves our gum, after which appears the morning redness. When I saw water coagulate itself, says Senior, I was sure that all I had been told was true; this coagulated water they call the male, and they espouse it to a female, whose son he is, and is also his root and coagulation. Female they call the milk which is coagulated, and male that which coagulates; for

activity belongs to the male, and passivity to the female. The first part is the fixed part of quicksilver, and the second its liquid and volatile part --- out of their mixture arises the Stone. The male and the female, being joined together, become one body. Venerate, says Alexander, the king and his queen, and do not burn them. The male is under the female, and has no wings; the female has wings, and desires to fly, but the male holds her back. Hence the philosophers say: make the woman rise over the man, and the man rise over the woman. So also Rosinus: The woman is fortified by the man.

I must repeat that the male and the female are the same in the same subject, and yet have different and even contrary qualities. It is like the male and female principles in any vegetable seed, or the active and the passive principle in an egg. Thus, when the Stone first comes into existence, it has in it a mixture of the male and female principles, but at first it is liquid, fluent, volatile, bright, and capable of coagulation, i.e., female. The coagulum in its womb is solid, permanent, fixed, and produces coagulation in the other, i.e., is male. The female that flees is passive, white, and easily caught by the male; the male that pursues is red, and seizes and holds the female with great strength.

Similarly, the Sages have compared the two principles in our substance to an old and a young man, because the colour of old age is white, while that of youth is ruddy and bright. Hence Rhasis: The stone of our science in the beginning is an ancient and in the end a boy, because it is first white and afterwards red.

They have also given geographical names to this substance, calling the humid principle the Egyptian, and the dry principle the Persian; Egypt the house of humidity, and Persia the house of dryness. The Egyptians, says Melvoscindus, need the help of the Persians. All putrefaction takes place in humid substances, but the end of putrefaction is dryness and incineration. The putrefaction begins in Egypt, but its end is in Persia. They have also described our substance by saying that the white female has the red male in her womb, and is in the travail throes. The coagulation will then be the accomplishment of the birth; that which was within now coming out, and that which is flexible becoming fixed. Such are a few metaphors under which our substance has been described.

## *Chapter VII.*

### **This is a Chapter of the Different Similitudes of the Generation and Birth of the Embryo out of the Menstrual Blood, and of a Chicken out of an Egg --- Considered as Analogous to the Birth of Gold out of Sulphur and Quicksilver.**

We will now proceed to illustrate our meaning still further by the help of some analogies. The first analogy we shall select is the generation of the foetus in the mother's womb. The generation of the foetus is brought about by the male sperm, in conjunction with the female menstrual blood. The latter is the substance, the former the active principle. As soon as the form is generated, the sperm is purged off. In generation, the male contributes the form and the active principle, the female contributes the substance and the body. The sperm is to the menstrual blood what the carpenter is to the wood in producing a bench, hence the sperm is not part of the thing generated. So gold is caused by sulphur as the efficient or active means and by quicksilver as the substantial or passive means. And as the sperm informs with a form similar to itself, and not foreign, so is it in like manner with sulphur. The outward sulphur acts by digestion upon the inward sulphur which is latent in the quicksilver, and causes it to inform, coagulate, colour, and fix the

quicksilver into the form of gold or of the Stone of the Philosophers.

It should also be observed that the sperm generates out of the substance first the heart, thus impressing upon the heart the generative virtue which belongs to it as part of the living body. Then the sperm is separated from the heart, because now the heart is able of itself to form the other members by means of the generative power imparted to it by the sperm. When the sperm has generated the heart, its work is done, and all that remains is performed by the heart. The same principle holds good in the germination of plants. When the seed, in which all the generative force is at first inherent, has sent forth the germ or shoot, the seed itself withers and decays, as something which has henceforth become useless, and the power of generating the rest of the plant is now inherent in the germ or shoot. When the germ has once been formed, it no longer needs the seed, but produces leaves, flowers, and seed out of itself. Thus the germ is, like the heart, generated and then separated from its sperm.

In the same, we declare that the outward sulphur generates out of the quicksilver a certain sulphur which is like the heart, and to which henceforth belongs all the generative force of the outward sulphur. Thus, the outward sulphur, being no longer needed, is purged off. The sperm, which in our case is the sulphur, having introduced the form into the quicksilver, by means of the internal sulphur, by means of the internal sulphur, having done its work, is no longer wanted.

You should know that since it is unnecessary for the moving principle continually to keep in contact with that which it moves, provided it has once touched it, as you may see from the case of the archer and the arrow, so the sperm, and the heart generated by the sperm, need not always keep up their connection. In the same way, as soon as the outward sulphur has touched the quicksilver, and generated or created another sulphur out of the quicksilver, which now possessed the power of generating and imparting the form of gold, it is not necessary that the outward sulphur should remain any longer in contact with the quicksilver; it is sufficient that it has touched it in the past. Hence it is fitting that what is extrinsic should be separated, as something corruptible from what is incorruptible.

Again, in human generation, if the sperm be sufficiently powerful, and has sufficient heat to assimilate the whole of the menstrual blood to itself, the sperm, coming as it does from a male, will naturally produce a male in the mother's womb. But if the sperm has not sufficient heat or strength, it will not be able to digest the female substance; the latter will, therefore, prevail, and a female will be the result. The consequence of this arrangement is that females have not so much natural heat as males. It is the same with our sulphur and quicksilver. If the inward sulphur has sufficient heat to digest the whole of the quicksilver, it assimilates the quicksilver to itself, and the whole is changed into gold. In the contrary case, the quicksilver will prevail and change the whole substance into silver. Hence gold is yellow like sulphur, and silver is white like mercury. But the yellowness and whiteness in quicksilver are not of double origin; both are of the quicksilver, just as the white and yellow of an egg are both the product of the female bird. In other metals, the sulphur has not yet been able to digest the quicksilver because of its want of heat, as in lead and tin, or it has burnt the quicksilver by means of its excessive heat, as in iron and copper.

For the heat of the sulphur may be in excess as well as too little, and thus digestion may be prevented in two opposite ways. When heat is too great it dries up the humidity of the substance, and when it is too small it is choked by this humidity. Too much fire will spoil the food, and too little will not be sufficient to cook it. Gold alone, of all the metals, is properly digested by temperate heat, and silver in the same way; but all other metals suffer either from excess or defect of heat.

But, after all, we should remember, with Aristotle, that the real motive principle in sperm is not the sperm itself, but the soul of the person who generates with the sperm, as with an instrument to shape the timber or to fashion the sword. The intelligent soul of man, through the medium of the spirit or blood, moves the hand as an instrument, and the hand moves the outward substance. So the soul of the person generating uses the seed or sperm as an instrument, and acts on the substance or menstrual blood indirectly through the sperm. It is the same with sulphur and quicksilver in the generation of metals; sulphur is not the principal agent, but the occult mineral virtue, or chief intrinsic agent, which acts with the heavenly bodies, and makes an instrumental use of the sulphur; which, then, in its turn, moves the quicksilver, as a substance proper for the generation to which it is moved by the first agents. In this Art, the soul or intelligence of the Artist, wherein are the species and the knowledge, is the real, extrinsic, moving cause, and imparts its purpose to the digestive and liquefactive mineral virtue, which again, in its turn, moves directly the outward sulphur, and indirectly the inward sulphur and the quicksilver. Liquefaction, coagulation and other accidents, are brought about the cold and heat, but the form is produced by the movement of instrumental forces which are themselves set in motion by the intelligent mind of the Artist, who modifies, tempers, and aids the action of natural conditions.

#### *The Analogy of Common Quicksilver.*

As the egg of the hen without the seed of the male bird can never become a chicken, so common quicksilver without sulphur can never become gold, or the Stone of the Philosophers, because without sulphur it has no generative virtue; again, sulphur without quicksilver can never become gold, or the Stone, because it is like the seed and sperm of the male, and there is no generation without the menstrual blood of the female, which is the substance and nutriment of generation. The generation of gold is of quicksilver, and its nutriment (like that of the chicken in the egg) is of the yellow substance, namely, sulphur. Hence the Stone is generated of the white, i.e., quicksilver, and the nutriment of the yellow, i.e., its' hidden sulphur digested by the action of the outward sulphur through the regulative power of our Art. Nature has wisely mingled the sulphur and common quicksilver, the male and the female substance, in metals, for the purpose of their generation. And as everything attains to growth and development by the same principles to which it owes its generation, so gold and the Stone must be perfected by the action of homogeneous substances, and not by substances foreign to them. So, also, if imperfect metals are to be changed into gold by means of the Stone, even this agent can make use only of that substance in them which is identical with that of gold, while all foreign corruptive elements must be purged off; this means that only out of quicksilver can gold be generated by the mediation of the Stone, for which reason the sulphureous elements which are in the common metals are heterogeneous, and must be removed, because they will not amalgamate with it. Those, again, who attempt to prepare our Stone out of non-metallic substances are grievously at fault, and spend their labour in vain.

The artist who would prepare the Stone, must take for his substance neither common quicksilver alone, nor common sulphur alone, nor yet a mixture of common quicksilver and common sulphur, but a substance in which Nature herself, who is the handmaid of Art, has combined quicksilver and sulphur. The two substances of which we speak are really one substance, and are never found apart. They are capable of developing into gold, and this development actually takes place under favourable circumstances. For we see that geographical situation has an influence in either elevating or degrading animal and vegetable forms, we may conclude that the same probably holds good in the case of metals. Local influences may sometimes be favourable to the development of sulphur and quicksilver into gold, or they may cause the process of

development to stop short at one of the imperfect metals. Again, the imperfection of the common metals may be owing to a corrupt state of the surrounding earth, or to an excess of bad sulphur.

### *Chapter VIII.*

#### **Refutation of Some Objections. It is said that Copper and Iron cannot become Gold and Silver. How this is possible. The difficulty solved.**

Many admit that those common metals which are still in a crude and half-digested completed so as to become gold. But, they say it is different with iron and copper, which, through the excessive quality of their digestive heat, have already passed the proper point of temperate digestion, and, therefore, can never be brought back to the intermediate state indicated by gold.

It should, whoever, be observed that there are in all varieties of metal, except gold, two kinds of sulphur, one external and scorching, the other inward and non-combustive, being of the substantial composition of quicksilver. The outward is separable from them; the inward sulphur is not. The outward sulphur, then, is not, in any real sense, united to the quicksilver: hence the quicksilver cannot be really scorched by it. If this be so, it follows that when the quicksilver is purified by the removal of the outward sulphur, it is restored to its original condition, and can be transmuted into gold and silver, whether it be found in tin and lead, or in iron and copper; and we may justly conclude from these considerations that when the Philosopher's Stone is projected upon iron or copper in a liquefied state, it mingles in a moment of time with all the particles of quicksilver existing in them, and with these only, as they alone are of a nature homogeneous with its own, and perfects them into the purest gold, while all particles of external sulphur are purged off, because they are not of a nature homogeneous with that of the Philosopher's Stone. For quicksilver always most readily combines with any substance that is of the same nature with itself, and rejects and casts out everything heterogeneous. It does not matter what are the other constituent parts of a metal; if it be a metal, and contain quicksilver, that quicksilver can be changed into gold by means of the Philosophers' Stone. So we see that, in the case of milk, the coagulum clots only those parts of the milk which are of a nature homogeneous with its own. The scorching to which our objectors refer, has taken place only in the sulphur of iron and copper; the quicksilver is not at all affected by this adverse influence, as any experimental chemist will tell you. If we burn or coagulate quicksilver with sulphur, and make from their sublimation what is called uzifur (that is, cinnabar from sulphur and mercury), after the magistry of sublimation, we may separate the substance of the quicksilver from the uzifer, pure and clean, which shews that the quicksilver did not undergo combustion, but the sulphur only. It is the same in the cases of iron and copper, and in this manner the difficulty is settled.

*This is the end of our Golden Investigation, extracted from the world of Bonus of Ferrara by Janus Therapus Lacinius, the Calabrian Minorite friar.*

# **An Explanation of the Natural Philosopher's Tincture, of Theophrastus Paracelsus**

**by Alexander von Suchten**  
**Doctor of Philosophy and Medicine**

The ancient teacher Hieronymus says that it was formerly ordained among the Jews that no one under the age of 30 years might read the first Chapter of Genesis. Be this true or not, it is certainly not the custom among the Jews at the present time. Yet it is undeniable that man by a right contemplation and understanding of this Chapter, may gain a knowledge of many Arcana and secrets of creation. Not to mention other things, this Chapter is especially suitable to our Chemical Art. Indeed, of all books concerning the Theory and Practice of the Philosopher's Stone, I know not of one which, from beginning to end, could more plainly and graphically describe our Art, than the Almighty Himself has done in that whole process of His great Creation. Since, however, Theophrastus diligently, and above all others, in his book, *Tinctura Physicorum*, followed in the way prescribed by God, and in the aforesaid book has sufficiently described both the matter and Practice --- or handiwork --- both of the Ancient Philosophers as well as of his own new corrected opinion, I will in this place substitute no other practice, but simply give a short Guide for better understanding of his book in order that beginners in this Art (I write not for the learned) may, by diligent study, and God's Grace, attain to, not alone an understanding of the above Theoretical Firmament, but also the necessary manual skill in this Art from beginning to end.

Theophrastus, in describing this our philosophical work and creation (which is nothing other than a small world, since in it appear the participation and similitude of all things), follows the same method as Moses in describing the creation of the Great World. For, before Moses treats of the matter, he enumerates the three principles which indistinctly lay therein, but which, by God, were distinctly developed from the same. So also does Theophrastus, for, before giving the matter of his work, he indicates that, although it is one thing, three things lie hidden in it. These must, by fire or water, be extracted, and again be united into one being and substance, according to Christ's saying: "He who knoweth not to extract many things from one thing, the same knoweth also not to make one out of many". Now, Theophrastus says: "The matter of the Tincture is One Thing that, by fire, has been extracted out of three". This is to be understood as the general consensus of all philosophers. What Theophrastus here affirms, Geber also substantiates. There is one Stone, one Medicine, to "which we neither add, nor take from it, anything".

Bernhardus says: "There is a single root from which the two Mercurial Substances and our whole work are extracted or made".

Morienus says: "The first and principal substance of this thing is one, and out of it is one thing".

Agadmon, in the Turba, testifies also: "Therefore dismiss all plurality, for Nature is content with one thing", etc.

Hermes, a father of all philosophers, also says in his Tabula: "Even as all things have been born from one, by the mediation of One, so also all things have been born from this one thing, by adaptation".

Hercules especially agrees with Theophrastus, saying: "This Magisterium proceeds from one root, which afterwards is expanded into several things, returning again to one". (See *Pandor.*, fol. 8,706.).

From all of which the Truth and foundation of this Art is apparent, for Truth is where there appears no contradiction.

Therefore also can false Alchemists be easily detected in this one point alone.

And since God Almighty Himself has created the whole great World, all Celestial, Animal, Vegetable, and Mineral Natures from one single thing and primeval root, how should Man be wiser than God, and for this work --- which, not less than the Great Outer World, contains within itself the seed and qualities of all creatures --- use more than one thing.

For the said Art --- according to the testimony of Gerrariensis, Chap. 22 --- should imitate Nature. The matter of Art will be the matter of Nature and, since the matter of nature is unique, viz., the origin and matter of metals, therefore, also, the matter of Art will be unique. The Book of Genesis relates that this primary matter was of a moist nature, or water, for, when diligently reading the text, although the three principles are first enumerated, viz., Heaven, Earth, and the Spirit of God; yet there soon follows the matter out of which God created Heaven, viz., water, which God took and divided into two parts of pieces, as you will hear. Hermes, or Mercurius Trismegistus, although an Egyptian priest, without enlightenment from God, may yet have derived great wisdom from writings perhaps left behind by Moses after Exodus. Hermes names not alone the matter from which all elements are drawn, a moist nature, but alludes pointedly to the division. (*Pymander*, Chap. I.). This Word (Spirit), moving over humid nature, cherished it. But ardent and light fire straightway flew out from the bowels of humid nature; also light, air, obedient to the Spirit, took the middle place between fire and water. Earth and water lay mixed with each other, so that the face of the earth might nowhere appear, being drowned by the waters. Then these two were separated by the Spiritual Word”.

Also Plato: “Water is the principle of the universe. For, from water are all things produced, and into water all reduced”. Hermes calls water the principle of all things. Theophrastus is herein of the same opinion, except that he does not expressly call matter water or moist nature. But he says it is composed of three substances, calling them here an Eagle, a Lion, and a Golden Glitter.

In *Liber Metamorphoseos* he terms them: Mercury, Salt, and Sulphur. That is just the opinion of Hermes and other philosophers, speaking of Spirit, Body, and Soul. (See *Key of Chemical Philosophy*, by Dornaeus, fol. 411). How, now, these three can, by the artist, by means of Vulcan’s art, be extracted and freed from their prison, and again be united, will follow later. Remember, for the present, that he calls the one thing, from which shall be born the great and also the little world, a Red Lion. Had he desired to indicate it more plainly, he would have called it a moist nature, or water. He does this to prevent the unworthy from sharing this secret with the worthy. Other philosophers have exercised the same caution. For it is written, “This stone is hidden both from men and from demons”. But it is called a Lion on account of its great strength and power. For as a Lion is the strongest and fleetest animal, mastering the other animals, and therefore compared to a king of beasts --- so also, amongst things created, there will not easily be found a fleeter, stronger, more penetrating thing, subjugating, occupying, overcoming, and ruling, without exception, man and others.

Hermes confirms such swift strength, saying: “This matter is the strongest strength of all strength”. This is also experienced by those who know this Lion, and by proper preparation have been instructed how to use

it upon other creatures. Then one sees after what manner this thing occupys, conquers, destroys, kills all things, even changing them from one form into another, nothing being exempted from its rule or untterrified by its roars. Hence by philosophers it is named the Animated Thing. Hermes says: "Behold, it conquers every subtle, and penetrates every solid, substance!". For this reason Dionysius Zacharias calls it a Governor, and Bernhardus a King. For there is nothing that can bear so much rain, wind, work, heat, or cold, while it can be conquered or killed by nothing --- except it be by water --- as those know who have had such monsters in their keeping. Therefore it may be rightly named a strong Lion, by reason of the temperate conjunction of the Elements. For those Elements are separated and purified, and alternately married in a suitable manner, there being generated from them a Tempered Substance, which the Violence of Fire cannot separate, nor earth's corruption vitiate, nor the muddiness of Water condemn, nor the contact of Air cloud. In order that one should not imagine such Lion to be a strange, rare thing, he, Bernhardus says: "This Lion is named by many but known by few". And it is true that it is at the present day carried about by all sorts of men in their mouths, although few, yea, only those whose eyes God has opened to Nature's virtues and powers, can recognize and use it. Yet in its substance, nature, and matter it is so common, often-used a thing that Bernhardus says: "The whole world have it before their eyes". Morienus asserts it to be so universal that Man could not live without it. Verily, "I declare to thee", quoth he to King Calid, "that this Thing by Divine Will has been greatly used in Creation, and nothing made by God can exist without it". Every person knows this thing, and whoso knows it not, he knows nothing else. I should like to see a child of 7 or 8 who is not acquainted with it, and is without a hearty appetite and desire for it immediately he beholds it. This inclination proceeds from man's inner spirit, which well knows that all power to preserve health and long life are hidden in his one thing alone. And, in order that this substance be revealed and made known, he gives you another hint and sign whereby you yourself may recognize it, saying: "Such matter is the Greatest Pearl and Noblest Treasure upon Earth according to God's Revelation and man's desire". These words are literally copied from the Lesser Rosary, which says: "For God has under Heaven created no more precious thing, except the rational mind". Examine one after the other all creatures, you will find among them all no more precious, better, more lovely, or nobler creature created by God. An intelligent man can easily find bottom here by diligently observing the above explanations, together with the Sympathy and Disposition (Diathesis) of God's creation with respect to man's natural life. I will let the above instances and the guiding of Theophrastus suffice, and now refer you to our Author's little Book, *De Viribus Spiritualium*, where he speaks of the Spirit of Life. There you will find that the Spiritis Vitae, or man's life, is itself a celestial, invisible vapour; it is the temperament between the Elements, and is included in the Stars and all Heaven's influences as far as the firmament stretches. Cornelius Agrippa, in Book I, "*Concerning Occult Philosophy*", and the Spirit of the World, teaches how and by what means such Spirit is attracted from the Stars into nether corporeal bodies by their Magnetic Force.

Richard, the Englishman, also teaches the same fully in his *Corrector. Alchy.*, Part V, Chap. 8 and 9: "When you have now found which most abundantly partakes of this Influx and Spirit of life from other, the same you may use for your work, and apply it by right means and preparation, using its Spirit for the strengthening, preservation, and augmentation of you own spirit. This is more than enough concerning the matter".

Now he comes to the preparation, and to the before-mentioned three principles, saying: "That this Lion, by Nature's aid and the artist's art, may be transmuted into the White Eagle, and thus, out of one, two are made".

Here the Author has wished to signify that, in this Art, man must follow the rule left him by God, the First

Chemist. For, God having created all Creatures and Elements out of one thing, viz., Water, it follows that He began by making two things out of the original one thing. The first He has taken up on high, making of it a heavenly water; the other was gathered together below, and by coagulation became Earth. St Peter, II, Chap. 3, briefly mentions these three principles: "By the Word of God the Heavens were of old, and the Earth standing out of the Water and in the Water". Esdras, Book 4, the last chapter, says: "For God hands the Earth over the Waters by His Word".

Thus also in this work the Artist must divide his process into two parts:

(1) By distillation conduct one part on high, making of it a clear, heavenly Spiritual Water, here called a White Eagle. For, as no bird is so keen-sighted, or soars so high as the eagle, so also we know of no water so volatile, so penetrating, as this, for it ascends to the Heavens; and, as the Lion's father and son, penetrates his bone and marrow, as we shall presently shew. Our Eagle is the true key to human renovation, and the bath of new Birth and Rejuvenation, as saith the Psalmist: "Like the Eagle shall thou renew thy youth". It is a white transparent Water of heavenly colour, according to Alanus and Bernhardus, and hence is by many called Heaven (Coelum) by reason of its lofty qualities.

This Eagle is the first part of the water which ascends on high, the Ascendens of Hermes mentioned in his Tabula.

Esdras, Book 4, calls it: "The Spirit of the Firmament". Other philosophers term it Water, Spirit, or Soul of the World, the Middle Nature which is a quasi-body and quasi-not-soul, and quasi-soul and quasi-not body. It is the ligament and vinculum of all Elements --- also, the one universal, generative Nature, dispersed through all the parts of the world".

And, since it has its center in the Supreme Circle (as being very light), whence also it came in the First Universal Generation of things, so when freed it ascends towards Heaven to its Centre. Above it has been called Humor Lunae, or the Humid Radical of all Creatures.

Compare Aurelius Augurellus, Book I, "*To the Lion*", 10.

For this (Anima Mundi) is diffused everywhere,

And everywhere is active;

In the winds of heaven, in the earth, and the bosom of the wide waters.

They enclose the Soul, by which all things of earth do live. Thence the world itself derives its life. But, since the Sol is trammled by no body, and the world, and all parts thereof, are in material form; therefore, between these two the Spirit is the intermediary, which is neither body, nor Soul, sharing in both these natures.

Therefore in this live and increase Sea, Air, and Fire. This, embracing all things. Is always the Bird (Eagle), always the root, ever bringing forth and perpetuating life.

At length, imprisoned in yellow gold, itself seeks the hand of the artificer, who may loose its bonds, and, by

its virtue, become powerful.

(2) The other part of the water --- or of our Lion --- according to the teaching of Moses, became corrupted and dry. That is now the second part of our Art, viz., the investigation of the substance of the Lion, when the aforesaid Eagle has been hatched out from his body, by warmth, as from an egg, and has flown away. To speak plainly concerning it, it is the dry, waste earth, and the cursed earth in Gen. V. It has its first name of Lion by reason of its aforesaid strength and sharpness. For, as a lion has sharp teeth, biting through that which he seizes, so also is this earth so sharp as to be unbearable on the tongue because of its penetrating nature. It cannot be touched without offence so the tongue, as saith the philosopher. Elsewhere Theophrastus calls it “An invisible, consuming fire”.

Bernhardus retains its name of King, and says: “Although Fontin, the aforesaid Eagle, is the King’s Mother, yet is the King nobler than Fontin”. For, although he always retains the name of Lion, yet is he changed from his first nature, is no longer a virgin, but has been fructified by the Spirit brooding over the water --- his original first substance --- and has borne a heavenly, spiritual fruit, viz., the aforesaid Eagle. Hence these verses:

A virgin, not one day old,  
By Nature’s decree espoused a man,  
And, before she had reached the age of one year,  
To this man a child she bore,  
Yet she died before she was born.

And in The Song of Solomon, Chap. VIII, “I raised thee up under the apple tree, there thy mother brought thee forth; there she brought thee forth that bare thee”.

Hermes calls the inferior substance gross or descending. For, being heavy, it has, and seeks, its center in the lowest circle, as it were, subject to the superior heaven and its influx, or the Soul of Middle nature, or Mundane Spirit. Above it has been called by its right name of Solar and Natural Heat of all corporal and natural things.

Now, as to the third principle, viz., the Spirit brooding, etc. It is, according to Theophrastus the Glitter of Gold. For this Earth is but the real fine Gold, left imperfect by Nature, to be perfected by Art, as Ferrariensis says (Chap. 64): “The terrestrial parts are nothing else than the occult gold of philosophers”.

Other sages define it as “The Soul of the World, whose colour is golden”. Now, since in the first Universal Creation, the third principle, the Spirit of God, has never been separated from the other two, but the two have remained in one as the Spirit above, and in the water, so also is it in our microcosmic, particularistic, and philosophical Creation. We cannot obtain this third principle, this golden flitter, this beautiful gold-red colour, separate by itself. “It shines not to the Spagyryus”, saith Theophrastus, i.e., it conceals itself and is lost when one is made into two. What, then, becomes of it? According to Gen. Chap. 1, and the opinion of philosophers, it remains with the aforesaid water, and since that water ascends towards heaven, this Golden Glitter must accompany it in its center. Theophrastus, however, considers that it remains with the earth, perhaps on account of the Old Testament saying that the Soul is in the Blood, wherefore the Israelites were forbidden to eat it.

Now, it should be noted this Golden Glitter, as the third principle, is often called the Soul, and cannot be produced other than as a red, thick, stagnant blood --- sometimes called the Lion's Blood by our author --- and Theophrastus ascribes it to that body which, in the first distillation, goes not over out of the retort (crucible). For herein, say Alchemists, is the whole art, that the gold go out of the retort. And this is true did they but understand the Gold and its Glitter aright. How the glittering spiritual Soul of this third principle --- when duly extracted from the Lion's body --- hovers above the water, and there yet remain two in one, you will hear afterwards. For the soul cannot exist, out of its center, as an impalpable, invisible entity without a body. "For a spirit is neither visible nor palpable, except it hath assumed a body from some Element. Hence this spirit --- by reason of its noble nature --- receives a Body in the highest and noblest Sphere of the Elements, viz., in the Igneous Sphere. Yet, in the fire, this spirit loses not its nature, neither is it Fire, nor of an igneous nature; although it dwells in Fire, and by many is called Fire of Nature".

Aurelius Augurellus hath these words in his second book: "But another elicits these various hidden parts from pure Blood, and has ordained the Elements to lead them forth;

"That thus these occult spirits might perchance be seen or touched with the hands, or enclosed in a vessel.

"For otherwise they would straightway penetrate the vessel, although imprisoned in hard atrament.

"By violence can no Spirit be forced to remain in any part of the Vast Orb, so greatly does it rejoice to dwell quietly in its own habitation:.

Such external Body is the Lion, or dry earth, which retains its redness, its outward aspect, its stagnant blood, which has no exit, the body being not yet open --- as one sees in those hanged or suffocated, who stifle in their blood --- as the Book of the Trinity relates in Figures. Raymundus Lullius says briefly, in *Testamentum Novissimum*, thus: "My son, Quicksilver is water distilled from its earth, and similarly earth is Animated Quicksilver, while the Anima (Soul) is Natural Heat which is bound in the primary Essence of the Elements of Animated Mercury.

Now that this jewel has been presented to you through the Faculty of Philosophy, you have a short guide to the teaching of Theophrastus. Having taken the right philosophical matter, you are now to extract from it two things contained therein, viz., the Eagle (Mercury), and then the Body (the Salt), which, as Everlasting Balsam, contains also the third thing, the Spiritual Soul, the Golden Glitter, or true gold seed. These you shall extract according to the counsel given in Ovid by Medea to Old Jason, who would become young again, viz., that he --- by Anatomy --- should divide his limbs, and, reuniting them in a warm bath, he should become younger and of great strength.

But that you may apply the theory, and learn the modus operandi whereby from Unity, two things, and from two, three are obtained. Theophrastus comes to the Practice. "It is the mark of a wise man first to know the causes before putting his hand to the task". Theophrastus shews you two ways --- one Ancient, the other discovered and used by himself --- saying the Ancients had a very long way "before accomplishing the aforesaid separations and achieving their object". In the beginning they, out of a Simplex --- or also out of a Subjectivum like God Himself --- and also Theophrastus, have made two things, viz., Water and Earth". And he continues to say: "that Artists have to these two Simplices given the name Lili --- afterwards using the said Simplices and not one". But know it is indifferent whether you, in the beginning, use one or two things. If our matter is found in one thing, it will equally well be found in two (Nature

having already converted the original One into Two). Such simplicity of the subject Ferrariensis describes well, Chapter 12: “The first radical Element, whence all the Elements derive their origin, is Humidity, or Water, i.e., liquefaction”. Or, according to others, it is the earth.

Shortly after he says: “For the Beginning of the World there is One Sole Element, which is Primary Matter, from the Division of which, by reason of opposing qualities, were generated the four Elements, which were in it potentially”.

Aurelius Augurellus, Book II, says:

“Besides within there is ordained a double force,  
Which always acts and suffers,  
As a female and male when together ---  
Even as a chicken grows in the shell,  
By the action of the one and the suffering of the other in turn,  
And by cherishing heat externally applied”.

If you begin with one thing you must first make two of it. But, by taking two, such as Earth and Water --- Nature having educed this Binary from one --- you are saved the trouble, and have only to generate the third, which, as aforesaid, is always hidden in one of these two. Thus Lion’s Blood is the Bride around whom they dance, viz., the natural red Sulphur or Seed of Gold, ordained by God and nature to bear its like. But, being mixed and bound up too much with earth and superfluities, it cannot perform its office, except it be freed by one of Vulcan’s smiths from all bolts and bands of its natural prison. Therefore have both the Ancient Sages and Theophrastus taken great pains to liberate these Captive Souls from their Eternal Darkness by the Descent to Hell of our Heavenly Eagle --- according to Isaias: Those in darkness and the shadow of death see a great light. Thus have the Ancients united the two things, and, after a month’s putrefaction, extracted the spirit, that is, the water, with gentle fire by distillation. For this water will not stand a great fire, and if vexed with the same it becomes impatient, angry, and wrath to such an extent that it “knocks all of a heap”, as Bernhardus says, the residual matter they treated with strong water until the same went over as a dry spirit. Compare Solomon’s Song, II. C.: “Who is this that cometh out of the wilderness like pillars of smoke, perfumed with myrrh and frankincense, with all powders of the merchant?”.

Now, this dry spirit is the substance or body of the Lion himself, the sharp earth, the old, miserly, jealous man, who breaks not willingly into the treasury, or likes to give up his golden-yellow oil, and only by force will let his palace be plundered. It is called a dry spirit by reason of the quantity of dominating fire therein, which is none other than the true philosophical Sulphur, as Bernhardus relates in the *Book Concerning the Transmutation of Metals*. But sulphur is none other than the pure action of Air and Fire, heating and digesting, or decocting, Earth and Water proportionately and homogeneously to themselves. Richardus, the Englishman, also says: “Philosophers’ Sulphur is a simple, living Fire, vivifying and maturing, and nothing but a hot and dry vapour generated from the purest terrestrial dryness in which Fire rules in every way”.

Now, since all the oil or spirit does not go over at once --- in order that none of this gold seed or potable gold as the Lion’s greatest treasure might remain behind --- they moistened the corpus mortuum (residuum) with spirits and, after a month’s putrefaction, again distilled over as at first, thus obtaining more of the oil. This moistening, putrefying, and distilling they repeated until the earth was wholly dissolved, and had given up its entire treasure, all the gold having distilled over and become a Mercury, i.e., Water, which has its

coagulation or its sulphur in its depths, as Geber says: "Our Mercury has in its depths fixed Sulphur, and nothing sinks in it except Gold". Dionysius well describes this process in this Practice: "After the Governor of the Firetown (oven, furnace) had retreated, his remaining warriors had long fought the enemy with fire, until they escaped the said enemy by retreating over the water and bridges which they had thrown up behind themselves".

That is the same thing that Aeneas did with the tree bearing golden branches. As often as he broke a branch off two grew in its place. Those are the lovely golden-yellow drops falling from the beak of the retort into the receiving vessel, one dripping down after the other, until the Lion has lost his whole heart, blood and strength. For that is the true Lion of Judah, sent by God to deliver His Peoples from their enemies and sins, in pain and torture to shed His Blood for them. The wound in His Side, whence flowing two long streams of Blood and Water, shall be a Fount of Purification to all those drinking therefrom. In these shall such water become the spring of a long, healthy life.

Bernhardus goes on to relate that the Ancients --- having got so far that nothing further distilled over from the earth --- they again purified the water and oil, removing all remaining bonds, until they at length reached the Pure Fount, and the true, beautiful, golden leaves of the Golden Book. Here are our Adam and Eve naked, for their eyes are opened, and now they see themselves, what was good and bad in their own substance. This is the Rectification whereby they cleansed these two of the accidental impurities of the first Distillation (for the unclean Spirits guarding the treasure in the earth love not to leave the same). This is the first process of our Philosophical Birth, the Returning into the Mother's Womb, whereby the Rule of God is followed, and the first precepts of chemists are fulfilled, viz., the Reduction into Primary Matter, into the Three Natural Principles, i.e., Animated Spirit, Mercury, and Sulphureous Vapour of Earth. Thereby are separated the Elements and the Pure from the Impure, and, finally, the Seeds of Gold are brought from the Darkness to Light, which is nothing less than the Generation of Nature in the Generation of Metals, and The Process with Double Smoke of Paracelsus. But the above method entailed heavy expenses and much time and labour, all of which the Ancient Sages could have avoided, and obtained the Lion's treasure by a shorter cut, had they enquired into the matter as diligently as Theophrastus.

Now, I wot there is no one who would not wish to know this shorter method; and that you may not have to complain of Theophrastus, he shews you another short way, admonishing you also to let the above tedious process be, and to take from the Lion nought but his rosy blood, and from the Eagle the white gluten. These two bodies you must coagulate together and bring into one body, as it were male and female seed.

Now, someone might object thus. Dear Theophrastus, that is the old story which I have heard long ago. The Ancients took nothing more than the Lion's blood and water, and coagulated them. Yet you tell me the same is a brief way to obtain the aforesaid two Mercurial Substances, with little labour and in a short time.

Well, that is true so far. Theophrastus is not so clear here as he might be. But you may easily imagine what the mode of preparation must be if you have diligently studied Theophrastus's other books and preparations, and are otherwise experienced in Chemical labours. You will then find that Chemistry, in the preparation of all arcana (secrets), has two methods, viz., Distillation and Extraction. Whatsoever is to be prepared by Chemistry and brought into its Arcanum, its Tincture, or Quintessence (in which is the power and virtue of all creatures), or is to be cleansed from impeding impurities, that must be done by Distillation or Extraction (which is the same as Solution). There is no other means. As Bernhardus says: "The King never goes forth except the Fountain attract him".

Now, having already heard that he rejects the tedious process of much distillation and purification by reason of its expense, etc., you perceive that he must have used the only other means, viz., Extraction by Solution.

According to Calid, son of Jazichus: "Solution is the Extraction of the Interior of Things to their Superficies, so that the hidden become manifest". Hence his (Theo.'s) meaning is this: When you of one thing have made two --- or have taken two things differently constituted by Nature --- let the old process alone; take from the Lion his blood only --- i.e., cut out his heart with his own sharp spear --- or as Bernhardus says: "Slay the King with his own sharp, poisonous Mercurial Water". In plain words: Extract but from the earth its Tincture or Arcanum, and the blood, the sunshine, the dry spirit immediately all distills over. By such extraction or solution more will be done in a few hours than the Ancient Sages could effect in six months. By the above process the whole work may be completed in ten or twelve months, in which time the Ancients could barely achieve the first step --- i.e., Reduction into Primary Matter --- as all those know whom God has enlightened, and thought worthy you know this Solution and Extraction.

But misunderstand me not! I speak here, not of the second solution of the earth, but of the first solution of the crude body.

How this solution and extraction is effected it behooves not to tell here more plainly --- as our author says -- - not to put the food right into the bad birds' beaks. As the saying is: He who would reach the open sea must first pass through the narrow straits. That is the blessed place of which Esdras writes (Bk. IV, Chap. 2): The path to it is narrow, so that but one man can walk on the same. On one side is Fire, on the other Water. He who would inherit or possess these good things must first undergo much trouble and danger until he finds the narrow footpath between Fire and Water, and pass over. Now, having revealed this to you indirectly as far as may be, I would refer you to other philosophers. Remember Geber's rule: "That no Solution should be made, except in its own blood, and that calcined things are more soluble than non-calcined. For, by calcinations, they are reduced to the natures of Slats and Alums, which alone are soluble". If you are a true searcher after knowledge, the above will tell you more than too much.

Compare Aurelius Augurell., Book 3: "First, taking thin plates and filings of pure gold,

"Thou shalt crush and pound them into the form of fine powder, or river sand, with frequent blows:

"Until, at length, they become liquid, dissolved by putrid humour from within themselves.

"It will be well here sometimes to pour in large quantities of liquor of their own seed, but by no chance anything foreign".

This is also the aforesaid short process of Theophrastus, whereby you, in a short time, and with little trouble and expense, may find the two said things (of which one is the Father, or Sun, or Red Water, and the other the Mother, or Moon, or White Water) which are necessary for the perpetration of the miracle of the One Thing, and for which good counsel you owe Theophrastus many thanks. Thus, by God's help, is effected the first step of this process, which is done by the hand through Sublimation and Purification. By this the fleshly, corporeal Adam is killed, and Body, Soul, and Spirit, by the natural death, are separated from one another.

## **Second Operation: Conjunction ~**

Now follows the second operation, in which are brought about, by rest and without labour, the fixation and stability of those things which are sublimated and purified. This is the Resurrection from the Dead, in which Soul, Body, and Spirit, after Purification, come together again; and --- on our philosophical Last Day --- will arise as a new glorified body and a new spiritual man without blemish and sin. In this conjunction of Resurrection are comprised the whole spiritual body and the soul, and thus form One --- even as water mixed with water --- and are not separated in all Eternity. For in them is no diversity, yea, a Unity and Identity of all three substances, Spirit, Soul, and Body.

Even so it is plain concerning the Identity and Unity of the trinity in God the Father, Son, and Holy Ghost, which in the Deity are One and the Same, with distinction and diversity in substance.

The aforesaid process would have been no use to the Ancients, or to Theophrastus, had they not known how to bring to fruition, in its due season, the seed thus obtained. But, in order successfully to effect this, they had again to learn from Nature, and more especially from God as a Preceptor, in Genesis, Chap. 2, for there it is written thus: Although God had caused the earth bring forth all kinds of grass, herbs and trees, yet they could produce no fruit or propagate and increase their kind, until God had first let rain again upon the earth, the water first separated and taken up to heaven by Himself. And daily experience teaches us that the earth, when dry, is barren, and that nothing can grow unless frequently refreshed by rain and dew. Hence God has again united the water --- which He, as the first Distiller, took up on high --- with the dry earth, the Inferior with the Superior. The Ancients, following this rule, have often united white water with the Red Lion's Blood, as with the Earth (for, coagulated, such blood is earth), according to the teaching of Hermes: "It ascends from the earth into heaven, and again descends to earth, and receives the strength of inferior and superior things". And elsewhere: "Red Sun is father, White Moon is mother; join them together in one life and disposition". Morienus: Make the Red Smoke hold the White Smoke in a strong embrace and in a strong vessel, without exhalation of spirits".

Theophrastus also means that, when you have obtained the two things by the short method, viz., the rosy blood and the Eagle's white gluten, you shall thereto add nothing foreign. Compare Solomon's Cong, chapter 1:7: "Tell me, I thou whom my soul loveth, where thou makest the flock to rest at noon, for why should I be as one that turneth aside by the flocks of thy companions?". Take these two things alone, and of them again produce Unity --- of two Mercurial Substances make one --- like body and soul. Of two waters make one by coagulation. For Quicksilver, or our Mercury, is not coagulated by the coagulation caused by extrinsic mixture (except for corruption); but the same is, by its intrinsic Sulphur, coagulated to perfection. This is the Union of Heaven and Earth, the marriage of Adam and Eve, the Conjunction of Sun and Moon, the right Union of the World's Soul and Spirit with the Earth by the Union of their Centres, as Calid says: "Of all experiments there is none equal to that of conjoining two or more things whose centres are diverse, unless it be the conversion of their matter, and the mutation of their substance and properties from their original nature. Therefore, he who shall be able to change Soul into Body and Body into Soul, and to mix with the same subtle spirits, shall attain all things".

Compare Aurel. Augurellius, Book III: "Perchance here thou mayest seek the numbers and the weight of the things required by the for perfecting this work.

"Remember, therefore, there are of Things Primordial but Three.

From these take two; and from these again --- if thou judge rightly – one more.

The Triple Thing will then consist of Gold alone.

The decocted substances will form one homogenous mass.

For, joined together, they differ among themselves in nothing.

Each ingredient fuses its mass with that of the others”.

By this influx our earth is made fruitful, producing in due time all kinds of animal, vegetable, and mineral natures. This is the warm bath in the beginning of may of Bernhardus, expressed of old in the following figure of speech: “The Water of the Air between Heaven and Earth is of all things the Life. For, by its moisture and warmth, it is the medium between water and fire. The Heavens opening rained and dewed these Waters upon the Earth, rendering it moist and sweet as honey. Wherefore also the Earth blossoms, bringing forth divers colours and fruits; and, in the midst, there has grown up a great tree, with silver stem, stretching to the ends of the world; on its branches have sat many birds which have all flown away towards the East; and the raven’s head has become white”. All the above means but the spiritual generation and new birth of our Adam, through Water and the Spirit, for the same, in its former nature and earthly tabernacle, could not enter the Kingdom of heaven. Our old Adam must first put on its original pure nature, and thus, born again through spiritual water, and changed into a spiritual man, may, through much tribulation, enter the Promised Land.

### **Coagulation and Imbibition ~**

But how can such things be?, asks the learned and wise Nicodemus. Art thou a Master in Israel, taking upon thyself the highest works in Physics, and knowest not that? Well, Theophrastus tells it to you plainly in Chap. 3, viz., that it is done through the Pelican (for this is the grave in which shall rest our deceased Adam until his resurrection), even unto the third and fourth time, until the whole Lili, both matters, earth, and water, are dry on the ground. The words, “for the third and fourth time”, are to be interpreted as indicating the frequent rainfall necessary for fruition.

The ancient philosophers in their Small World, following Nature’s example, have been wont to divide the white water (which they first produced from their matter) into two or more parts. The first portion they quickly coagulated with the Lion’s Blood, by circulation in the Pelican, according to the formula: “Nature knows Nature, Nature rejoices in Nature, Nature receives Nature, and yet there is but one Nature, One Genus, One Substance, and One Essence”. Song of Solomon, Chap. 3:4 --- “But I found him whom my soul loveth; I held him and would not let him go, until I had brought him into my mother’s house, into my mother’s chamber”. To this coagulated, dry earth they have added the other portion of the water, moistening and drying by heat three or four times, until the earth has again received into itself the whole of its white water, and thus the whole Lili has become a dry body, Thus the ancients augmented the stone for fixation in the very beginning. Bernhardus says: “The king’s bath may be repeated. For the more frequently he be bated in such saline, Mercurial water, or sulphureous baths, the purer and stronger does he become. It is optional to do this three or four times in the beginning with coagulation, or only once. By frequent moistening you will get more fruit, also the further advantage (by augmenting in the beginning) of not having to do so at the finish”.

For the highest degree of purification, wash seven times in Jordan, and you will have many cwts. of water as your reward. Compare Solomon’s Song, Chap. 1: “Draw me, and we will run after thee; the King hath brought me into his chambers: we will be glad and rejoice in thee”.

For our multiplication (according to Raymundus) is nought but the reiteration of the process of our primordial creation. So also Bernhardus, in his book Concerning the Transmutation of Metals: “As in this process nothing extraneous enters into its first composition, so also the same multiplies nothing that is not if its first composition” But since all generations and corruptions in nature are caused by heat; and, especially since Nature, in the bringing forth of metals and earths, has no other instrument but a steady, gentle heat, therefore, also, all imitators of this art have be obliged to follow Nature. The steady warmth of the sun ripens every fruit, and the warmer the sun (yet not too dry and alternating with due rains), the better do fruits mature and turn out.

Hence the ancient sages have ever matured this our philosophical Seed by the heat of a sun shining steadily upon our earth and water, in which the other two are included, for “the virtue of fire and air cannot become apparent except in earth and water, virtue only acting through matter”. And, as the great world’s sun in summer gets hotter and hotter, until it has reached its highest ascension in the Zodiac, so also have all artists always augmented their “little Summer” in temperature until the matter, having been duly boiled and simmered, from black (through various changes of colour) became blood-red. We can assist our matter by heat alone. Hermes says: “Fire is the Regimen”. And Bernhardus also states: “That no one goes with the King to the bath but the stoker, whose sole duty it is to keep up the heat, and that his work is easily inflammable”. Ferrarianus is of the same opinion: “The whole strength lies in the fire. By this we discern and unravel the four Elements in that gross mass. By this we further join and combine things into one. By this we imitate the Sun, and perfect the imperfect”. In such warmth it attains maturity, ordained but never completed by Nature. For (quoth Theophrastus) Nature brings nothing complete to Light, but man, by spagyric preparation, must lead up to that ordained of Nature. Hence it is said: “Where Nature ends, there Art begins”. And: “Through God was our Philosophical Stone by Nature created, and to the same there is nothing wanting but purification and perfection”.

It also learns to fight with the fire, so that the same --- however great --- may gain no advantage over it. Compare Farrianus: “It rejoices in its own fire, just as anything, Vegetable, Animal, or Mineral, is better preserved in the place of its generation than elsewhere”.

### **The Foundation of Art ~**

The contents and foundation of this Art consist in dissolving gold and silver by the right means --- with water, or drying with fire of the volatile Philosopher’s mercury --- until the same be changed into a powder which cannot be again reduced to a solid body. This powder --- if it smokes not when laid on the fire --- tinges every imperfect body and mercury with a lasting gold or silver colour. The gold colours not except it be first changed by the white gold --- i.e., by their Philosopher’s Mercurial Water --- into a black substance they call their earth and caput corvi crow’s head), giving the same many names, which white gold is further changed into a vapour, and is our Fortified Spirit.

*Question* --- Whether in the Antimony of Philosophers or marcasita the Philosophers’ secret is hidden? He white gold is the secret, for out of the antimony of our black earth is extracted the highest arcanum of Philosophers, which is in effect a ruby liquor, sweet, and red as blood.

The Salt of Metals is the Philosopher’s Stone. Hence make salt of the metals without corrosives.

“Adam”, said God, “in fixed and not fixed, in these two lie hidden all Secrets: Thou art the Lesser World”.

Abel has written, that his father Adam gave names to all things.

Noah praises the oilstone (soapstone?) saying there is no stone possessing greater virtues.

Attain, therefore, in time a spiritual earth, not fleeing from fire: Because, among all elements the earth alone is fixed, and the Art of Alchemy wished that its Stone be fixed. Hence it is necessary that at the end of the operation all things should return to earth, i.e., fixation. Hermes' dictum is true: Its strength is integral, if poured into the earth. In such coction or digestion divers colours are to be seen, not less than in Great Nature in the earth.

For when the wet winter is passed, when the sun shines again, and the earth, during winter covered with water and snow, becomes dry, all manner of curious colours are seen, especially thee, viz., black, white, and red. Between these appear divers colours, as a yellowish colour after the virginal white or red; but this is not permanent. The other yellow remains longer, yet not so long as the black, white, or red. Crauser says, in *Turba*: “Know that it is a twofold thing to make white and red; the one thing is solution, the other decoction”. The former takes place in winter, when the earth is covered with snow and water, a certain indication of Putrefaction, a sign of commixture and of the changing of one thing into another, and is the colour of death. Solomon's Song: “I am black but comely, O ye daughters of Jerusalem, as the tents of Kedar, as the curtains of Solomon. Look not upon me because I am black, because the sun hath looked upon me!”.

The time of its duration is unequal. In the Bible one finds that the waters of the Flood lasted 156 days.

Bernhardus says: “In 130 days the King puts off his blackness, and appears in his white shirt”. Scala Phil. gives 140 days for such putrefaction. Vide *Pandor.*, fol 36. After these follow the other perfect colours, as the white of complete coagulation. Thus, putrefaction takes place in humidity, but the end of putrefaction is dryness; and inceration is a gentle induration, the occultation of humour, the fixation of spirit, the collecting of things diverse, the Renovation of Homogeneity, the adaptation to fire of things fleeing therefrom, and is the colour of regeneration and of semi-coction. It lasts also a long time --- according to Bernhardus almost 82 days --- which is a sign of fixation according to the Dictum of Lucas in the *Turba*: “When our Magnesia is white it lets not the spirit go from it”. Theophrastus sets no limit of time to such colours, as, in truth, none can be set, for it depends on the matter.

Compare Aurel. Augurell., Book III:

“Ye scarcely will anyone so exactly compute the years,  
As not either to diminish or add to their number”

For suitable material will sometimes accelerate the process, and unsuitable retard the same.

Or intense heat will by a little exceed the measure, but water by much.

And time and place will vary”.

The time will vary according as the artist tends his fire diligently or not. For this our work is a true woman's or cook's work. They simmer and boil and roast until the spit is done to a turn; they wash and dry the linen in the sun until it is snow white. Also this white colour is like unto the earth when dry; then the

corn soon gets white also, and is no far from maturity, viz., from the third colour, the yellow. As soon as the same appears in the corn it is cut; the winter is past, the rain over, the flowers have appeared, summer is come, and the turtledove is heard in our land. Thus also is the maturing of our matter, when its yellow colour appears, As regards its metallic nature, and the perfection of the same, we must bring that to a higher grade, says Bernhardus, viz., to its red colour, that it may thus communicate to other imperfect metals some of its superabundant perfection. For this redness is the sign of incorruptibility and complete digestion.

Just so Christ became more than perfect in the highest exaltation of His humanity through His rosy blood, in obedience, in fulfilling and satisfying the Law, and in love towards God, in order to communicate to us, His people, to its fullness, through the Holy Spirit, whereby we might become heirs and sharers of His Kingdom. In this our Elias goes up to Heaven in a storm and seated in a fiery chariot. Now go forth, ye daughters of Jerusalem, and behold King Solomon crowned by his mother on the day of his marriage and of his heart's joy. Every diligent student will now, without further explanation, be able to find these colours. Consult the philosophers concerning the same: Bernhardus, Scala Phil., etc., etc.

Attention must, during such coction, be paid to the proper order of the colours produced, for with them change the qualities of the active agent, demanding a corresponding mutation in the passive reagent. For, in our solution, the water is first active, the earth then attracting the King, but in coagulation it is passive. This change of mode cannot take place without development of divers colours, which is expressed by philosophers thus: "Heat acting on moisture generates blackness, and, acting on dryness, generates whiteness, in which redness is hidden.

Solomon mentions such coction and colours in his Song, Chap. 5:10 --- "My beloved is white and ruddy, the chiefest among ten thousand. His head is as the most fine gold, his locks are bushy and black as a raven. His eyes are as doves' eyes by rivers of waters, washed with milk and fitly set. His cheeks are as a bed of spices, as sweet flowers: his lips like lilies, dropping sweet-smelling myrrh. His hands are as gold rings, set with the beryl: is belly is as bright ivory, overlaid with sapphires. His legs are as pillars of marble, set upon sockets of fine gold". The ancient Sages have also mentioned the same in parables, as when they saw a mist rise in the distance (possibly the mist that watered the whole earth). They saw also the violence of the sea and of the water-floods upon the face of the earth, that the same stank in the darkness (putrefaction). They also beheld the King of the Earth sink, and heard him cry with a terrible voice: He who delivers me shall live forever, and rule in my glory on my royal throne, and all things shall be given into his power (i.e., blackness). On the following day they beheld above the King a most beautiful morning star, and the light of day illumining the darkness (i.e., whiteness), the bright sun rising through brilliant clouds of various forms and colours (i.e., yellowness and redness). Then, in fullness of time, the King was crowned with three costly crowns, of iron, of silver, and of pure gold. In his right hand they saw a scepter with seven glittering stars, and in his left a golden apple, upon which was sitting a white dove, with silvery body and golden wings.

But particularly is the frequent imbibition (moistening) of dry earth with water described and indicated in complete parables --- (Philosophers have given this process of imbibition many other names, such as Exaltation, Fermentation, etc., but they are all one, viz., the subtilization of White and Red, and the augmentation of excellence and quantity). They beheld a man, as black as a Moor, stuck fast in a black stagnant bog, to whose assistance came a young woman, beautiful of countenance, and clad in bright apparel. Her back was adorned with glorious white wings and golden feathers, and on her knees she wore fine pearls. On her head she had a crown of pure gold, set with a silver star, around her neck a necklet of

gold, set with precious stones, and on her feet golden shoes. From her proceeded the most sweet scent, above all aromas. She clothes man with a purple robe, inspires him with highest wisdom, and leads him to heaven. By diligently exercising yourself in suchlike parables, and --- at the same time --- paying attention to the works of Nature in the great generation, you will not only be able to await a plentiful harvest in due course, but will so increase the store of your philosophical oil, or tincture, as to be sort of vessels into which to pour the same; even as the widow of Elisha. Thus shall you be free from debt and feed your house in plenty; for your meal shall not diminish nor your cruse be wanting.

There is nothing said here of the fire whereby this artificial coction takes place. Perhaps it is the everlasting fire, of which many Alchemists boast, the fire used aforetime by the Jews for their burnt offerings, which burnt continually without becoming extinguished, which also was hidden by the Prophet Jeremiah before the first destruction of Jerusalem, and afterwards was discovered by Ezra. The same is said to have been thick and oily, like oil or honey, as Josephus describes it. If you can and will prepare it, good, if not, refer to the Turba, Chrysippus, etc., for they will give you a good account, saying that this fire may be prepared in many ways, always taking care not to let the active principle escape, or, as Bernhardus explains it: Not to let the bath take fire, and flee away like a fugitive eagle, thus causing a dissipation of seed and preventing generation. "For then the Elements will not combine, but will vanish by fire, on account of the strength of the spirit and of the dominating and operating volatile thing; so wilt thou become poor, and lose that which thou hast".

Hence the "triple vase" commonly used by Philosophers. And the "old hollow oak split through the middle", viz., the oaken sphere of Bernhardus, in whose middle is the clear stone, in which stood the bath. All this was done to ward off the too strong rays of the Sun, that our male and female seed might, without hindrance, remain together to the birth: "For the separation of active and passive necessarily prevents generation".

Compare Solomon's Song, Chap. 2: "I charge you, O ye daughters of Jerusalem, that ye wake not my love till he pleases".

When Theophrastus further speaks of Hungary, Istria, the South, or Cyprus, he gives you to understand in which countries our matter ought to be sought, and he leaves it to you whether you will have two different substances which, as regards their genus, are of one and the same nature. Therefore, seek the one, the Lion, in Hungary; but the Eagle in Istria. But if you rule your work through one thing, thus proceeding from Unity to Duality, and thence to three things, then travel to Cyprus. There you will be refused nothing.

Bernhardus has traveled yet farther, saying that he fetched his man, viz., the chosen jewel, the golden book, from India. Christophorus Parisiensis also went far for the same, and says: "When you quit the town of Venice, go far to the right until you find a pleasant level country: there is our Mercury". Whether in liquid or coagulated form, it is best to obtain it from the above-mentioned places, by reason of its beautiful red colour. Although found also in Germany and other countries --- Theophrastus saying elsewhere that of the perfect Medicine enough is found in Germany --- yet the native article is not so good and strong as the foreign. "For the virtue is dispersed, and less united, therefore less strong. For here masculine and feminine are substantively the same, and in the one subject are combined different and contrary virtues, since our Lion is hermaphrodite".

If you use but one thing, make of the same two, but, lastly, of one of these three. Afterwards for these three

build a tabernacle, and diligently take heed that the sacred Threefoldness be reduced through Duality to Unity, the Author of all consummate perfection. So from our New Earth and New Heaven (the old Earth and heaven having been destroyed by fire, together with their works) you will have a New World, the Holy Place, the New Jerusalem, as a bride for the bridegroom, wherein all tears, lamentation, and sorrow shall be no more, whose gates also are adorned with all manner of precious stones and pearls, the streets are of pure gold like unto a beautiful mirror, and the names of the dwellers therein are all written in the Book of Life.

There all things are new, for the former things have passed away; and, as Hermes briefly says: “Thou shalt have the World’s Glory and all thy desire”.

Finally, as regards the utility of the Medicine thus prepared, the same is sufficiently described in other books. That this medicine is of great use with respect to the health of the human body may easily be gathered from the aforesaid Medicinal Foundation. For this our philosophical Son, a Son of Sun and Moon, which rule the whole world, as a learned Astronomer has traversed all planetary spheres and the whole firmament in his colours. He also is born out of the Adamic clay (which is an extract of the Fifth Essence --- quintessence --- of all creatures and of the whole world), ascending to Heaven and descending thence to Earth, and thus acquiring all power and might both in Heaven and Earth. Hence he is a Lord over all Animal, Vegetable, and Mineral Natures, and can act according to his pleasure, and the same with his influence --- especially on man as the Microcosmus --- if applied to man’s Spirit of Life in an appropriate affinitive Vehicle.

But, as regards his other powers and influence over the metals, a means is necessary whereby to reduce, punish, and humble his rebellious people. Theophrastus here indicates as this means. Our Stone is first to conclude unity and friendship with the same, i.e., they are both to be fused together.

Aurel. Augurellius says likewise, in his third book:

“First mingle a little of the prepared medicament with the yellow metal, and thou wilt presently see the same take to itself the strength of the Blessed Powder.

Or, when thou shalt have collected again, by great and difficult art, the teeming seed from the pure gold, Then quickly mix with it an equal portion of purple powder, And warm the same with gentle heat, simmering for two months; In which space of time thou mayst behold produced the whole series of colours, Which, otherwise, thou hadst marveled to see in three years. As often as thou repeatest the operation again and again, so often shalt thou increase the virtue and quantity of thy powder”.

But he conceals the important point, for this fusion suffices not, if such molten matter be not heated during the proper time in a vessel with philosophical coction. For by this means the operator obtains full power over his Lord the King, thereupon reducing the subjects to obedience, as related by Dionysius Zacharius, a knack unknown to many operators, who have consequently not known how to set about the projection. For, although our Stone of itself colours, yet, according to Theophrastus, it does this less than when the Medium of Incorporation and Ingression of the Stone --- i.e., Fermentation --- is added.

Different philosophers have used different Media, each according to his own opinion. Farreanus, Berhardus, Roger Bacon, etc., etc., having some applied augmentation by means of repeated solution,

others by fermentation. Use which you will; either will lead to the desired result. (Vide *Pandor.*, Fol. 252). But here I call a Ferment a Stone already complete in its elements in comparison with the metals; Even as the ferment of dough overcomes the dough, converting it into itself, so also this stone converts metals into itself, just as dough is changed and converted by its ferment, because it derives its origin its ferment, because it derives its origin from the same, and not from anything foreign. Thus, also, the Ferment of metals is of their own substance, changing into itself. And since metals are generated from mercury and Sulphur, therefore, also, this ferment is generated from them; and because this our Ferment is of the form, nature, and digestion of gold, therefore, it will reduce metals to the nature and digestion of gold. For the form of individuals of the same species is one alone.

As regards its third use, our Stone matures all immature precious stones, and brings tem to their highest perfection. For this I refer you to others, being of opinion that such great gifts are given by God to man more to assist his neighborhood by works of charity than to enrich himself. Would that man recognized the resources of Nature and God's wonderful wisdom in the implanting of such powers in His creation! Then, by means of this Igneous Sulphur or Lion's Blood, or Philosopher's Stone, he might attain the highest Rubinical Gradation of all Jewels, as well as the White Eagle, making large pearls of small ones; and finally, might perform all philosophical works by the processes Theophrastus describes as digesting or putrefying sublimating or distilling, calcining, extracting, fermenting, etc., These are the steps by which you may attain to wisdom and to Solomon's throne, on the right hand of which are found long life and the tree of life, and on the left, riches and honour. That is, says Theophrastus, the object of our art, viz., long life and the honourable maintenance of the same in this vale of tears.

Now will I briefly recapitulate to you the whole process: Take first thy golden Man, thy red Adamic earth. For this earth is the middle nature between Mercury and metals, and the third composed of the same principles, Quicksilver and Sulphur. By noiseless metallic liquefaction of this earth the matter of its metallic ore acquires, virtues, and properties of the aforesaid principles, so that from it may be generated each and every metal, according to diversity of digestion; and to it is there nothing wanting but purification and complete digestion. This Red Adam lay in a warm bath that he may go to sleep. If he will not fall asleep, give him a good, strong, sleeping draught of his saturated liquor, which he loves to drink. Then, during his sleep, cut open his right side that the fair white woman, concealed within him, may come forth. When, now, this maiden has become marriageable, bring her to Adam --- lying on his bed and sick with love --- as his bed and sick with love --- as his daughter, sister, and wife. Whereupon Adam will know the woman, and she will become pregnant. Take then this pregnant woman --- letting the man go --- and guard her well for ten months, until the day of her parturition. She will then bear her first-born son, whom she has conceived from her father's spirit, a young spiritual Adam, to whom no other man is equal in deeds and miracles, who --- if daily fed with his young mother's milk --- when he reaches man's estate, will subdue all his brethren, will deliver them from death, and bring them to eternal death, and bring them to eternal joy in the kingdom of Honour, in which all creatures under heaven will rejoice with joy unspeakable. And, finally, the whole world will become full of gold, and pearls, and precious stones. For Solomon's vineyard bears him 1000, and to those that keep the fruit thereof, 200.

*( Introitus apertus ad oclusum regis palatium )*

by

**An Anonymous Sage and Lover of Truth**

## **Table of Contents**

**The Author's Preface**

**Of the Need of Sulphur for Producing this Elixir.**

**Of the Component Principles of the Mercury of the Sages.**

**Of the Chalybs of the Sages.**

**Of the Magnet of the Sages.**

**Of the Chaos of the Sages.**

**Of the Air of the Sages.**

**Of the First Operation-Preparation of Mercury by Means of the Flying Eagles.**

**Of the Difficulty and Length of the First Operation.**

**Of the Superiority of our Mercury over all Metals.**

**Of the Sulphur which is in the Mercury of the Sages.**

**Concerning the Discovery of the Perfect Magistry.**

**The Generic Method of Making the Perfect Magistry.**

**Of the Use of Mature Sulphur in the Work of the Elixir.**

**Of the Circumstantial and Accidental Requisites of our Art.**

**Of the Incidental Purgation of Mercury and Gold.**

**Of the Amalgam of Mercury and Gold, and of their Respective Proportions.**

**Concerning the Size, Form, Material, and Mode of Securing the Vessel.**

**Of the Furnace, or Athanor of the Sages.**

**Of the Progress of the Work during the First 40 Days.**

**Of the Appearance of Blackness in the Work of the Sun and Moon.**

**Of the Caution Required to Avoid Burning the Flowers.**

**Of the Regimen of Saturn.**

**Of the Different Regimens of this Work.**

**Of the First Regimen, Which is that of Mercury.**

**Of the Regimen of the Second Part, Which is that of Saturn.**

**Of the Regimen of Jupiter.**

**Of the Regimen of the Moon.**

**Of the Regimen of Venus Of the Regimen of Mars.**

**Of the Regimen of the Sun.**

**Of the Fermentation of the Stone.**

**The Imbibition of the Stone.**

**The Multiplication of the Stone.  
Of Projection.  
Of the Manifold Uses of this Art.**

**The Author's Preface**

I, being an anonymous adept, a lover of learning, and a philosopher, have decreed 'to write this little treatise of medicinal, chemical, and physical arcana, in the year 1645, after the Birth of Christ, and in the 23rd year of my age, to assist in conducting my straying brethren out of the labyrinth of error, and with the further object of making myself known to other Sages, holding aloft a torch which may be visible far and wide to those who are groping in the darkness of ignorance. The contents of this Book are not fables, but real experiments which I have seen, touched, and handled, as an adept will easily conclude from these lines. I have written more plainly about this Art than any of my predecessors; sometimes I have found myself on the very verge of breaking my vow, and once or twice had to lay down my pen for a season; but I could not resist the inward prompting of God, which impelled me to persevere in the most loving course, who alone knows the heart, and to whom only be glory for ever. Hence, I undoubtedly gather that in this last age of the world, many will become blessed by this arcanum, through what I have thus faithfully written, for I have not willingly left any-thing doubtful to the young beginner. I know many who with me do enjoy this secret, and am persuaded that many more will also rejoice in its possession. Let the holy Will of God perform what it pleases, though I confess myself an unworthy instrument through whom such great things should be effected.

**Chapter I  
Of the need of Sulphur for roducing the Elixir**

Whoever wishes to possess this secret Golden Fleece, which has virtue to transmute metals into gold, should know that our Stone is nothing but gold digested to the highest degree of purity and subtle fixation to which it can be brought by Nature and the highest effort of Art; and this gold thus perfected is called "our gold," no longer vulgar, and is the ultimate goal of Nature. These words, though they may be surprising to some of my readers, are true, as I, an adept, bear witness; and though otherwise persons entertain chimerical dreams, Nature herself is most wonderfully simple. Gold, then, is the one true principle of purification. But our gold is twofold; one kind is mature and fixed, the yellow Latten, and its heart or centre is pure fire, whereby it is kept from destruction, and only purged in the fire. This gold is our male, and it is sexually joined to a more crude white gold -- the female seed: the two together being indissolubly united, constitute our fruitful Hermaphrodite. We are told by the Sages that corporal gold is dead, until it be conjoined with its bride, with whom the coagulating sulphur, which in gold is outwards, must be turned inwards. Hence it follows that the substance which we require is Mercury. Concerning this substance, Geber uses the following words: "Blessed be the Most High God who created Mercury, and made it an all-prevailing substance." And it is true that unless we had Mercury, Alchemists might still boast themselves, but all their boasting would be vain. Hence it is clear that our Mercury is not common mercury; for all common

mercury is a male that is corporal, specific, and dead, while our Mercury is spiritual, female, living, and life-giving. Attend closely to what I say about our Mercury, which is the salt of the wise men. The Alchemist who works without it is like a man who draws a bow without a string. Yet it is found nowhere in a pure state above ground, but has to be extracted by a cunning process out of the substance in which it exists.

## **Chapter II**

### **Of the Component Principles of the Mercury of the Sages**

Let those who aim to purify Mercury by means of salts, faeces and other foreign bodies, and by strange chemical processes, understand that though our water is variously composed, it is yet only one thing, formed by the concretion of divers substances of the same essence. The components of our water are fire, the vegetable "Saturnian liquid," and the bond of Mercury. The fire is that of mineral Sulphur, which yet can be called neither mineral nor metallic, but partakes of both characters: it is a chaos or spirit, because our fiery Dragon, that overcomes all things, is yet penetrated by the odour of the Saturnian liquid, its blood growing together with the Saturnian sap into one body which is yet neither a body (since it is all volatile) nor a spirit (since in fire it resembles melted metal). It may thus be very properly described as chaos, or the mother of all metals. From this chaos I can extract everything --- even the Sun and Moon --- without the transmutatory Elixir. It is called our Arsenic, our Air, our Moon, our Magnet, and our Chalybs: these names representing the different stages of its development, even unto the manifestation of the kingly diadem, which is cast out of the menstruum of our harlot. Learn then, who are the friends of Cadmus; who is the serpent that devoured them; what the hollow oak to which Cadmus spitted the serpent. Learn who are the doves of Diana, that overcome the green lion by gentleness: even the Babylonian dragon, which kills everything with its venom. Learn, also, what are the winged shoes of Mercury, and who are those nymphs whom he charms by means of his incantations.

## **Chapter III**

### **Concerning the Chalybs of the Sages**

Our Chalybs is the true key of our Art, without which the Torch could in no wise be kindled, and as the true magi have delivered many things concerning it, so among vulgar alchemists there is great contention as to its nature. It is the ore of gold, the purest of all spirits; a secret, infernal, and yet most volatile fire, the wonder of the world, the result of heavenly virtues in the lower world --- for which reason the Almighty has assigned to it a most glorious and rare heavenly conjunction, even that notable sign whose nativity is declared in the East. This star was seen by the wise men of old, and straightway they knew that a Great King was born in the world. When you see its constellation, follow it to the cradle, and there you will behold a beautiful Infant. Remove the impurities, look upon the face of the King's Son; open your treasury, give to him gold, and after his death he will bestow on you his flesh and blood, the highest Medicine in the three monarchies of the earth.

## **Chapter IV**

## **Of the Magnet of the Sages**

As steel is attracted towards the magnet, and the magnet turns towards the steel, so also our Magnet attracts our Chalybs. Thus, as Chalybs is the ore of gold, so our Magnet is the true ore of our Chalybs. The hidden centre of our Magnet abounds in Salt, which Salt is the menstruum in the Sphere of the Moon, and can calcine gold. This centre turns towards the Pole with an archetic appetite, in which the virtue of the Chalybs is exalted into degrees. In the Pole is the heart of Mercury, the true fire (in which is the rest of its Master), sailing through this great sea that it may arrive at both the Indies, and direct its course by the aspect of the North Star, which our Magnet will manifest.

### **Chapter V Of the Chaos of the Sages**

Let the student incline his ear to the united verdict of the Sages, who describe this work as analogous to the Creation of the World. In the Beginning God created Heaven and Earth; and the Earth was without form and void, and the Spirit of God moved upon the face of the waters. And God said, "Let there be light," and there was light. These words are sufficient for the student of our Art. The Heaven must be united to the Earth on the couch of friendship, so shall he reign in glory for ever. The Earth is the heavy body, the womb of the minerals, which it cherishes in itself, although it brings to light trees and animals. The Heaven is the place where the great Lights revolve, and through the air transmit their influences to the lower world. But in the beginning all was one confused chaos. Our Chaos is, as it were, a mineral earth (by virtue of its coagulation), and yet also volatile air --- in the centre of which is the Heaven of the Sages, the Astral Centre. which with its light irradiates the earth to its surface. What man is wise enough to evolve out of this world a new King, who shall redeem his brothers from their natural weaknesses, by dying, being lifted on high, and giving his flesh and blood for the life of the world ? I thank Thee, O God, that Thou hast concealed these things from the wise and prudent, and hast revealed them unto babes!

### **Chapter VI Of the Air of the Sages**

Our air, like the air of the firmament, divides the waters; and as the waters under the firmament are visible to us mortals, while we are unable to see the waters above the firmament, so in "our work" we see the extracentral mineral waters, but are unable to see those which, though hidden within, nevertheless have a real existence. They exist but do not appear until it please the Artist, as the author of the *New Light* has testified. Our air keeps the extracentral waters from mingling with those at the centre. If through the removal of this impediment, they were enabled to mingle, their union would be indissoluble. Therefore the external vapours and burning sulphur do stiffly adhere to our chaos, and unable to resist its tyranny, the pure flies away from the fire in the form of a dry powder. This then should be your great object. The arid earth must be irrigated, and its pores softened with water of its own kind, then this thief with all the workers of iniquity will be cast out, the water will be purged of its leprous stain by the addition of true Sulphur, and you will have the Spring whose waters are sacred to the maiden Queen Diana. This thief is armed with all

the malignity of arsenic, and is feared and eschewed by the winged youth. Though the Central Water be his Spouse, yet the youth cannot come to her, until Diana with the wings of her doves purges the poisonous air, and opens a passage to the bridal chamber. Then the youth enters easily through the pores, presently shaking the waters above, and stirring up a rude and ruddy cloud. Do thou, O Diana, bring in the water over him, even unto the brightness of the Moon ! So the darkness on the face of the abyss will be dispersed by the spirit moving in the waters. Thus, at the bidding of God, light will appear on the Seventh Day, and then this sophic creating of Mercury shall be completed, from which time, until the revolution of the year, you may wait for the birth of the marvellous Child of the Sun, who will come to deliver his brethren from every stain.

## **Chapter VII**

### **Of the First Operation --- Preparation of Mercury by Means of the Flying Eagles**

Know, my brother, that the exact preparation of the Eagles of the Sages, is the highest effort of our Art. In this first section of our work, nothing is to be done without hard and persevering toil; though it is quite true that afterwards the substance develops under the influence of gentle heat without any imposition of hands. The Sages tell us that their Eagles must be taken to devour the Lion, and that they gain the victory all the sooner if they are very numerous; also that the number of the work varies between 7 and 9. The Mercury of the Sages is the Bird of Hermes (now called a goose, now a pheasant). But the Eagles are always mentioned in the plural, and number from 3 to 10. Yet this is not to be understood as if there should be so many weights or parts of the water to one of the earth, but the water must be taken so oftentimes acuated or sharpened as there are Eagles numbered. This acuation is made by sublimation. There is, then, one sublimation of the Mercury of the Sages, when one Eagle is mentioned, and the seventh sublimation will so strengthen your Mercury, that the Bath of your King will be ready... Let me tell you now how this part of the work is performed. Take 4 parts of our fiery Dragon, in whose belly is hidden the magic Chalybs, and 9 parts of our Magnet; mingle them by means of a fierce fire, in the form of a mineral water, the foam of which must be taken away. Remove the shell, and take the kernel. Purge what remains once more by means of fire and the Sun, which may be done easily if Saturn shall have seen himself in the mirror of Mars. Then you will obtain our Chameleon, or Chaos, in which all the virtues of our Art are potentially present. This is the infant Hermaphrodite, who, through the bite of a mad dog, has been rendered so fearful of water, that though of a kindred nature, it always eschews and avoids it. But in the grove of Diana are two doves that soothe its rabid madness if applied by the art of the nymph Mercury. Take it and plunge it under water till it perish therein; then the rabid and black dog will appear panting and half suffocated -- drive him down with vigorous blows, and the darkness will be dispelled. Give it wings when the Moon is full, and it will fly away as an Eagle, leaving the doves of Diana dead (though, when first taken they should be living). Repeat this seven times, and your work is done, the gentle coction which follows is child's play and a woman's work.

## **Chapter VIII**

### **Of the Difficulty and Length of the First Operation**

Some Alchemists fancy that the work from beginning to end is a mere idle entertainment; but those who

make it so will reap what they have sown -- viz., nothing. We know that next to the Divine Blessing, and the discovery of the proper foundation, nothing is so important as unwearied industry and perseverance in this First Operation. It is no wonder, then, that so many students of this Art are reduced to beggary; they are afraid of work, and look upon our Art as mere sport for their leisure moments. For no labour is more tedious than that which the preparatory part of our enterprise demands. Morienus earnestly entreats the King to consider this fact, and says that many Sages have complained of the tedium of our work. "To render a chaotic mass orderly" says the Poet, "is matter of much time and labour" --- and the noble author of the Hermetical Arcanum describes it as an Herculean task. There are so many impurities clinging to our first substance, and a most powerful intermediate agent is required for the purpose of eliciting from our polluted menstruum the Royal Diadem. But when you have once prepared your Mercury, the most formidable part of your task is accomplished, and you may indulge in that rest which is sweeter than any work, as the Sage says.

## Chapter IX

### On the Superiority of our Mercury over All Metals

Our Mercury is that Serpent which devoured the companions of Cadmus, after having first swallowed Cadmus himself, though he was far stronger than they. Yet Cadmus will one day transfix this Serpent, when he has coagulated it with his Sulphur. Know that this, our Mercury, is a King among metals, and dissolves them by changing their Sulphur into a kindred mercurial substance. The Mercury of one, two, or three eagles bears rule over Saturn, Jupiter, and Venus. The Mercury of from three to seven eagles sways the Moon; that of ten eagles has power over the Sun; our Mercury is nearer than any other unto the first *ens* of metals; it has power to enter metallic bodies, and to manifest their hidden depths.

## Chapter X

### On the sulphur which is in the Mercury of the Sages

It is a marvellous fact that our Mercury contains active sulphur and yet preserves the form and all the properties of Mercury. Hence it is necessary that a form be introduced therein by our preparation, which form is a metallic sulphur. This Sulphur is the inward fire which causes the putrefaction of the composite Sun. This sulphureous fire is the spiritual seed which our Virgin (still remaining immaculate) has conceived. For an uncorrupted virginity admits of a spiritual love, as experience and authority affirm. The two (the passive and the active principle) combined we call our Hermaphrodite. When joined to the Sun, it softens, liquefies, and dissolves it with gentle heat. By means of the same fire it coagulates itself; and by its coagulation produces the Sun. Our pure and homogeneous Mercury, having conceived inward Sulphur (through our Art), coagulates itself under the influence of gentle outward heat, like the cream of milk --- a subtle earth floating on the water. When it is united to the Sun, it is not only not coagulated, but the composite substance becomes softer day by day; the bodies are almost dissolved; and the spirits begin to be coagulated, with a black colour and a most fetid smell. Hence it appears that this spiritual metallic Sulphur is in truth the *moving principle in our Art*; it is really volatile or unmaturred gold, and by proper digestion is changed into that metal. If joined to perfect gold, it is not coagulated, but dissolves the corporal gold, and remains with it, being dissolved, under one form, although before the perfect union death must precede, that

so they may be united after death, not simply in a perfect unity, but in a thousand times more than perfect perfection.

## Chapter XI Concerning the Discovery of the Perfect Magistry

There are those who think that this Art was first discovered by Solomon, or rather imparted to him by Divine Revelation. But though there is no reason for doubting that so wise and profoundly learned a sovereign was acquainted with our Art, yet we happen to know that he was not the first to acquire the knowledge. It was possessed by Hermes, the Egyptian, and some other Sages before him; and we may suppose that they first sought a simple exaltation of imperfect metals into regal perfection, and that it was at first their endeavour to develop Mercury, which is most like to gold in its weight and properties, into perfect gold. This, however, no degree of ingenuity could effect by any fire, and the truth gradually broke on their minds that an internal heat was required as well as an external one. So they rejected aqua fortis and all corrosive solvents, after long experiments with the same -- also all salts, except that kind which is the first substance of all salts, which dissolves all metals and coagulates Mercury, but not without violence, whence that kind of agent is again separated entire, both in weight and virtue, from the things it is applied to. They saw that the digestion of Mercury was prevented by certain aqueous crudities and earthy dross; and that the *radical* nature of these impurities rendered their elimination impossible, except by the complete inversion of the whole compound. They knew that Mercury would become fixed if it could be freed from their defiling presence --- as it contains fermenting sulphur, which is only hindered by these impurities from coagulating the whole mercurial body. At length they discovered that Mercury, in the bowels of the earth, was intended to become a metal, and that the process of development was only stopped by the impurities with which it had become tainted. They found that that which should be active in the Mercury was passive; and that its infirmity could not be remedied by any means, except the introduction of some kindred principle from without. Such a principle they discovered in metallic sulphur, which stirred up the passive sulphur in the Mercury, and by allying itself with it, expelled the aforesaid impurities. But in seeking to accomplish this practically, they were met by another great difficulty. In order that this sulphur might be effectual in purifying the Mercury, it was indispensable that it should itself be pure. All their efforts to purify it, however, were doomed to failure. At length they bethought them that it might possibly be found somewhere in Nature in a purified condition --- and their search was crowned with success. They sought active sulphur in a pure state, and found it cunningly concealed in the House of the Ram. This sulphur mingled most eagerly with the offspring of Saturn, and the desired effect was speedily produced --- after the malignant venom of the " air" of Mercury had been tempered (as already set forth at some length) by the Doves of Venus. Then life was joined to life by means of the liquid; the dry was moistened; the passive was stirred into action by the active; the dead was revived by the living. The heavens were indeed temporarily clouded over, but after a copious downpour of rain, serenity was restored. Mercury emerged in a hermaphroditic state. Then they placed it in the fire; in no long time they succeeded in coagulating it, and in its coagulation they found the Sun and the Moon in a most pure state. Then they considered that, before its coagulation, this Mercury was not a metal, since, on being volatilised, it left no residue at the bottom of the distilling vessel; hence they called it unmaturing gold and their living (or quick) silver. It also occurred to them that if gold were sown, as it were, in the soil of its own first substance, its excellence would probably be enhanced; and when they placed gold therein, the fixed was volatilised, the hard softened, the coagulated dissolved, to the amazement of Nature herself. For this reason they wedded these two to each other, put them in a still over

the fire, and for many days regulated the heat in accordance with the requirements of Nature. Thus the dead was revived, the body decayed, and a glorified spirit rose from the grave; the soul was exalted into the Quintessence --- the Universal Medicine for animals, vegetables, and minerals.

## **Chapter XII**

### **The Generic Method of Making the Perfect Magistry**

The greatest secret of our operation is no other than a cohobation of the nature of one thing above the other, until the most digested virtue be extracted out of the digested body of the crude one. But there are hereto requisite: Firstly, an exact measurement and preparation of the ingredients required; secondly, an exact fulfilment of all external conditions; thirdly a proper regulation of the fire; fourthly, a good knowledge of the natural properties of the substances; and fifthly, patience, in order that the work may not be marred by overgreat haste. Of all these points we will now speak in their proper order.

## **Chapter XIII**

### **Of the Use of Mature Sulphur in the Work of the Elixir**

We have spoken of the need of Mercury, and have described its properties more plainly and straightforwardly than has ever been done before. God knows that we do not grudge the knowledge of this Art to our brother men; and we are not afraid that it can ever become the property of any unworthy person. So long as the secret is possessed by a comparatively small number of philosophers, their lot is anything but a bright and happy one; surrounded as we are on every side by the cruel greed and --- the prying suspicion of the multitude, we are doomed, like Cain, to wander over the earth homeless and friendless. Not for us are X the soothing influences of domestic happiness; not for us the delightful confidences of friendship. Men who covet our golden secret pursue us from place to place, and fear closes our lips, when love tempts us to open ourselves freely to a brother. Thus we feel prompted at times to burst forth into the desolate exclamation of Cain: "Whoever finds me will slay me." Yet we are not the murderers of our brethren; we are anxious only to do good to our fellow-men. But even our kindness and charitable compassion are rewarded with black ingratitude- ingratitude that cries to heaven for vengeance. It was only a short time ago that, after visiting the plague-stricken haunts of a certain city, and restoring the sick to perfect health by means of my miraculous medicine, I found myself surrounded by a yelling mob, who demanded that I should give to them my Elixir of the Sages; and it was only by changing my dress and my name, by shaving off my beard and putting on a wig, that I was enabled to save my life, and escape from the hands of those wicked men. And even when our lives are not threatened, it is not pleasant to find-ourselves, wherever we go, the central objects of human greed... I know of several persons who were found strangled in their beds, simply because they were suspected of possessing this secret, though, in reality, they knew no more about it than their murderers; it was enough for some desperate ruffians, that a mere whisper of suspicion had been breathed against their victims. Men are so eager to have this Medicine that your very caution will arouse their suspicions, and endanger your safety. Again, if you desire to sell any large quantity of your gold and silver, you will be unable to do so without imminent risk of discovery. The very fact that anyone has a great mass of bullion for sale would in most places excite suspicion. This feeling will be strengthened when people test the quality of our gold; for it is much finer and purer than any of the gold which is brought from

Barbary, or from the Guinea Coast; and our silver is better even than that which is conveyed home by the Spanish silver fleet. If, in order to baffle discovery, you mix these precious metals with alloy, you render yourself liable, in England and- Holland at least, to capital punishment; for in those countries no one is permitted to tamper with the precious metals except the officers of the mint, and the licensed goldsmiths. I remember once going, in the disguise of a foreign merchant to a goldsmith's shop, and offering him 600 pounds worth of our pure silver for sale. He subjected it to the usual tests, and then said: "This silver is artificially prepared." When I asked him why he thought so, his answer was: "I am not a novice in my profession, and know very well the exact quality of the silver which is brought from the different mines." When I heard these words I took myself away with great secrecy and dispatch, leaving the silver in the hands of the goldsmith. On this account, and by reason of the many and great difficulties which beset us, the possessors of this Stone, on every side, we do elect to remain hidden, and will communicate the Art to those who are worthily covetous of our secrets, and then mark what public good will befall. Without Sulphur, our Mercury would never be properly coagulated for our supernatural work; it is the male substance, while Mercury may be called the female; and all Sages say that no tincture can be made without its latten, which latten is gold, without any double speaking. Wise men, notwithstanding, can find this substance even on the dunghill; but the ignorant are unable to discern it even in gold. The tincture of gold is concealed in the gold of the Sages, which is the most highly matured of bodies; but as a raw material it exists only in our Mercury; and it (gold) receives from Mercury the multiplication of its seed, but in virtue rather than in weight. The Sages say that common gold is dead, while their's is living; and common gold is dead in the same sense in which a grain of wheat is dead, while it is surrounded by dry air; and comes to life, swells, softens, and germinates only when it is put into moist earth. In this sense gold, too, is dead, so long as it is surrounded by the corporeal husk, always allowing, of course, for the great difference between a vegetable grain and metallic gold. *Our* grain is quickened in *water* only; and as wheat, while it remains in the barn is called grain, and is not destined to be quickened, because it is to be used for bread making --- but changes its name, when it is sown in the field, and is then called seedcorn; *so* our gold, while it is in the form of rings, plate, and coins, is called common gold, because in that state it is likely to remain unchanged to the end of the world; but *potentially* it is even then the gold of the Sages, because if sown in its own proper element, it would in a few days become the Chaos of the Sages. Hence the Sages bid you revive the dead (i.e., the gold which already appeared doomed to a living death) and mortify the living, i.e., the Mercury which, imparting life to the gold, is itself deprived of the vital principle. Their gold is taken in a dead, their water in a living, state, and by their composition and brief coction, the dead gold revives and the living Mercury dies, i.e., the spirit is coagulated, the body is dissolved, and thus both putrefy together, until all the members of the compound are torn into atoms. The mystery of our Art, which we conceal with so great care, is the preparation of the Mercury, which above ground is not to be found made ready to our hand. But when it is prepared, it is "our water" in which gold is dissolved, whereby the latent life of the gold is set free, and receives the life of the dissolving Mercury, which is to gold what good earth is to the grain of wheat. When the gold has putrefied in the Mercury, there arises out of the decomposition of death a new body, of the same essence, but of a glorified substance. Here you have the whole of our Philosophy in a nutshell. There is no secret about it, except the preparation of Mercury, its mingling with the gold in the right proportions, and the regulation of the fire in accordance with its requirements. Gold by itself does not fear the fire; hence the great point is, to temper the heat to the capacity of the Mercury. If the Mercury is not properly prepared, the gold remains common gold, being joined with an improper agent; it continues unchanged, and no degree of heat will help it to put off its corporeal nature. Without our Mercury the seed (i.e., gold) cannot be sown; and if gold is not sown in its proper element, it cannot be quickened any more than the corn which the West Indians keep underground, in air-tight stone jars, can germinate. I know that some self-constituted "Sages" will take exception to this teaching, and say that common gold and running

Mercury are not the substance of our Stone. But one question will suffice to silence their objections: Have they ever actually prepared our Tincture? I have prepared it more than once, and daily have it in my power; hence I may perhaps be permitted to speak as one having authority. Go on babbling about your rain water collected in May, your Salts, your sperm which is more potent than the foul fiend himself, ye self-styled philosophers; rail at me, if you like; all you say is conclusively refuted by this one fact --- you cannot make the Stone. When I say that gold and Mercury are the only substances of our Stone I know what I am writing about; and the Searcher of all hearts knows also that I say true. The time has arrived when we may speak more freely about this Art. For Elias the artist is at hand, and glorious things are already spoken of the City of God. I possess wealth sufficient to buy the whole world -- but as yet I may not use it on account of the craft and cruelty of wicked men. It is not from jealousy that I conceal as much as I do: God knows that I am weary of this lonely, wandering life, shut out from the bonds of friendship, and almost from the face of God. I do not worship the golden calf, before which our Israelites bow low to the ground; let it be ground to powder like the brazen serpent. I hope that in a few years gold (not as given by God, but as abused by man) will be so common that those who are now so mad after it, shall contemtuously spurn aside this bulwark of Antichrist. Then will the day of our deliverance be at hand when the streets of the new Jerusalem are paved with gold, and its gates are made of great diamonds. The day is at hand when, by means of this my Book, gold will have become as common as dirt; when we Sages shall find rest for the soles of our feet, and render fervent thanks to God. My heart conceives unspeakable things, and is enlarged for the good of the Israel of God. These words I utter forth with a herald's clarion tones. My Book is the precursor of Elias, designed to prepare the Royal way of the Master; and would to God that by its means all men might become adepts in our Art --- for then gold, the great idol of mankind, would lose its value, and we should prize it only for its scientific teaching. Virtue would be loved for its own sake. I am familiar with many possessors of this Art who regard silence as the great point of honour. But I have been enabled by God to take a different view of the matter; and I firmly believe that I can best serve the Israel of God, and put my talent out at usury, by making this secret knowledge the common property of the whole world. Hence I have not conferred with flesh and blood, nor attempted to obtain the consent of my Brother Sages. If the matter succeeds according to my desire and prayer, they will all rejoice that I have published this Book.

## **Chapter XIV**

### **Of the Circumstantial and Accidental Requisites of our Art**

We have weeded out all vulgar errors concerning our Art, and have shewn that gold and Mercury are the only substances required. We have shewn that this gold is to be understood, not metaphorically, but in a truly philosophical sense. We have also declared our Mercury to be true quicksilver, without any ambiguity of acceptance. The latter, we have told you, must be made by art, and be a key to the former. We have made everything as clear as noonday; and our teaching is based, not on hearsay, or on the writings of others, but on our own personal and oft repeated experience. The things we faithfully declare are what we have both seen and known. We have made and do possess the Stone --- the great Elixir. Moreover, we do not grudge you this knowledge, but wish you to attain it out of this Book. We have spoken out more plainly than any of our predecessors; and our Receipt, apart from the fact that we have not called things by their proper names, is perfectly trustworthy. It remains for us to give you some practical tests by which the goodness or unsuitableness of your Mercury may be known. and some directions for amending its defects. When you have living Mercury and gold, there remains to be accomplished, first, the purging of the

Mercury and the gold, then their espousal, and finally the regulation of the fire.

## **Chapter XV**

### **Of the Incidental Purging of Mercury and Gold**

Perfect gold is found in the bowels of the earth in little pieces, or in sand. If you can meet with this unmixed gold, it is pure enough; if not, purge it with antimony or royal cement, or boil it with aqua fortis, the gold being first granulated. Then smelt it, remove the impure sediment, and it is ready. But Mercury needs inward and essential purging, which radical cleansing is brought about by the addition of true Sulphur, little by little, according to the number of the Eagles. Then it also needs an incidental purgation for the purpose of removing from its surface the impurities which have, by the essential purgation, been ejected from the centre. This process is not absolutely necessary, but it is useful, as it accelerates the work. Therefore, take your Mercury, which you have purified with a suitable number of Eagles, sublime it three times with common salt and iron filings, and wash it with vinegar and a moderate quantity of salts of ammonia, then dry and distil in a glass retort, over a gradually increasing fire, until the whole of the Mercury has ascended. Repeat this four times, then boil the Mercury in spirits of vinegar for an hour, stirring it constantly. Then pour off the vinegar, and wash off its acidity by a plentiful effusion of spring water. Dry the Mercury, and its splendour will be wonderful. You may wash it with wine, or vinegar and salt, and so spare the sublimation; but then distil it at least four times without addition, after you have perfected all the eagles, or washings, washing the chalybeat retort every time with ashes and water; then boil it in distilled vinegar for half a day, stirring it strongly at times. Pour off the blackish vinegar, add new, then wash with warm water. This process is designed to purge away the internal impurities from the surface. These impurities you may perceive if, on mixing Mercury with purest gold, you place the amalgam on a white sheet of paper. The sooty blackness which is then seen on the paper is purged away by this process.

## **Chapter XVI**

### **Of the Amalgam of Mercury and Gold, and of their Respective Proportions**

When you have done all this, take one part of pure and laminated gold, or fine gold filings, and two parts of Mercury; put them in a heated (marble) jar, i.e., heaved with boiling water, being taken out of which it dries quickly, and holds the heat a long time. Grind with an ivory, or glass, or stone, or iron, or boxwood pestle (the iron pestle is not so good; I use a pestle of crystal): pound them, I say, as small as the painters grind their colours; then add water so as to make the mass as consistent as half melted butter. The mixture should be fixable and soft, and permit itself to be moulded into little globules --- like moderately soft butter; it should be of such a consistency as to yield to the gentlest touch. Moreover, it should be of the same temperature throughout, and one part should not be more liquid than another. The mixture will be more or less soft, according to the proportion of Mercury which it contains; but it must be capable of forming into those little globules, and the Mercury should not be more lively at the bottom than at the top. If the amalgam be left undisturbed, it will at once harden; you must therefore judge of the merits of the mixture, while you are stirring it; if it fulfils the above conditions, it is good. Then take spirit of vinegar, and dissolve in it a third part of salt of ammonia, put the amalgam into this liquid, let the whole boil for a quarter-of-an-hour in a long necked glass vessel; then take the mixture out of the glass vessel, pour off the liquid, heat the mortar,

and pound the amalgam (as above) vigorously, and wash away all blackness with hot water. Put it again into the liquid, let it boil up once more in the glass vessel, pound it as before, and wash it. Repeat this process until the blackness is entirely purged out. The amalgam will then be as brilliant and white as the purest silver. Once more regulate the temperature of the amalgam according to the rules given above; your labour will be richly rewarded. If the amalgam be not quite soft enough, add a little Mercury. Then boil it in pure water, and free it from all saltiness and acidity. Pour off the water, and dry the amalgam. Make quite sure that it is thoroughly dried, by waving it to and fro on the point of a knife over a sheet of white paper.

## Chapter XVII

### Concerning the Size, Form, Material, and Mode of Securing the Vessel

Let your glass distilling vessel be round or oval; large enough to hold neither more nor much less than an ounce of distilled water in the body thereof. Let the height of the vessel's neck be about one palm, hand-breath, or span, and let the glass be clear and thick (the thicker the better, so long as it is clear and clean, and permits you to distinguish what is going on within) --- but the thickness should be uniform. The substance which will go into this vessel consists of 1/2 oz. of gold, and one oz. of mercury; and if you have to add 1/3 oz. of mercury, the whole compound will still be less than 2 oz. The glass should be strong in order to prevent the vapours which arise from our embryo bursting the vessel. Let the mouth of the vessel be very carefully and effectually secured by means of a thick layer of sealing-wax. The utensils and the materials required are not then very expensive --- and if you use my thick distilling-vessel you will avoid loss by breakage. The other instruments that are requisite are not dear. I know that many will take exception to this statement; they will say that the pursuit of our Art is a matter of all but ruinous expense. But my answer consists in a simple question: What is the object of our Art? Is it not to make the Philosopher's Stone --- to find the liquid in which gold melts like ice in tepid water? And do those good people who are so eager in their search after "Mercury of the Sun," and "Mercury of the Moon," and who pay so high a price for their materials, ever succeed in this object? They cannot answer this question in the affirmative. One florin will buy enough of the substance of our water to quicken two pounds of mercury, and make it the true Mercury of the Sages. But, of course, glass vessels, coals, earthen vessels, a furnace, iron vessels, and other instruments, cannot be bought for nothing. Without a perfect body, our ore, viz., gold, there can be no Tincture, and our Stone is at first vile, immature, and volatile, but when complete it is perfect, precious, and fixed. These two aspects of our Stone are the body, gold, and the spirit, or quicksilver.

## Chapter XVIII

### Of the Furnace or Athanor of the Sages

I have spoken about Mercury, Sulphur, the vessel, their treatment, etc. etc.; and, of course, all these things are to be understood with a grain of salt. You must understand that in the preceding chapters I have spoken metaphorically; if you take my words in a literal sense, you will reap no harvest except your outlay. For instance, when I name the principal substances Mercury and gold --- I do not mean common gold in the state in which it is sold at the goldsmiths -- but it must be prepared by means of our Art You *may* find our gold in common gold and silver, but it is easier to make the Stone than to get its first substance out of common gold. "Our gold" is the Chaos whose soul has not been taken away by fire. The soul of common

gold has retired before the fiery tyranny of Vulcan into the inmost citadel. If you seek our gold in a substance intermediate between perfection and imperfection, you will find it: but otherwise, you must unbar the gates of common gold by the first preparatory process (ch. xv.), by which the charm of its body is broken, and the husband enabled to do his work. If you choose the former course, you shall use only gentle heat; in the latter case, you will require a fierce fire. But here you will be hopelessly lost in a labyrinth, if you do not know your way out of it. But whether you choose our gold, or common gold, you will in either case need an even and continual fire. If you take our gold, you will finish the work a few months sooner, and the Elixir will be ten times more precious than that prepared from common gold. If you work with "our gold," you will be assisted in its calcination, putrefaction, and dealbation by its gentle inward (natural) heat. But in the case of common gold, this heat has to be applied externally by foreign substances, so as to render it fit for union with the Virgin's Milk. In neither case, however, can anything be effected without the aid of fire. It was not, then, in vain that Hermes counts fire next to the Sun and Moon as the governor of the work. But this is to be understood of the truly secret furnace, which a vulgar eye never saw. There is also another furnace, which is called our common furnace, made of potter's earth, or of iron and brass plates, well compacted with clay. This furnace we call Athanor, and the shape which I like best is that of a tower with a "nest" at the top. The "tower" should be about three feet high, and nine fingers wide within the plates. A little above the ground, let there be a little opening of about three or four fingers wide, for removing the cinders; over that, there should be a fire-place built with stones. Above this, we place the furnace itself, which should be such as to exclude all draughts and currents of air. The coals are put in from above, and the aperture should then be carefully closed. But it is not necessary that your furnace should exactly correspond to the description which I have given so long as it fulfils the following conditions: firstly, it must be free from draughts; secondly, it must enable you to vary the temperature, without removing your vessel; thirdly, you must be able to keep up in it a fire for ten or twelve hours, without looking to it. Then the door of our Art will be opened to you; and when you have prepared the Stone, you may procure a small portable stove, for the purpose of multiplying it.

## Chapter XIX

### Of the Progress of the Work during the First Forty Days

When you have prepared our gold and Mercury in the manner described, put it into our vessel, and subject it to the action of our fire; within 40 days you will see the whole substance converted into atoms, without any visible motion, or perceptible heat (except that it is just warm). If you do not yet rightly know the meaning of "our gold," take one part of common gold (well purified), and three parts of *our* Mercury (thoroughly purged), put them together as directed (cap. xvi), place them over the fire, and there keep them at the boiling point, till they sweat, and their sweat circulates. At the end of 90 days you will find that the Mercury has separated and reunited all the elements of the common gold. Boil the mixture 50 days longer, and you will discover that our Mercury has changed the common gold into "our gold," which is the Medicine of the first order. It is already our Sulphur, but it has not yet the power of tinging. This method has been followed by many Sages, but it is exceedingly slow and tedious, and is only for the rich of the earth. Moreover, when you have got this Sulphur do not think that you possess the Stone, but only its true Matter, which you may seek in an imperfect thing, and find it within a week, by our easy yet rare way, reserved of God for His poor, contemned, and abject saints. Hereof I have now determined to write much, although in the beginning of this Book I decreed to bury it in silence. This is the one great sophism of all adepts; some speak of this common gold and silver, and say the truth, and others say that we cannot use it,

and they too, say the truth. But in the presence of God I will call all our adepts to account, and charge them with jealous surliness. I, too, had determined to tread the same path, but God's hand confounded my scheme. I say then, that both ways are true, and come to the same thing in the end --- but there is a vast difference at the beginning. Our whole Art consists in the right preparation of our Mercury and our gold. Our Mercury is our way, and without it nothing is effected. Our gold is not common gold, but it may be found in it; and if you operate on our Mercury with common gold (regulating the fire in the right way), you will after 150 days have our gold, since our gold is obtained from our Mercury. Hence if common gold have all its atoms thoroughly severed by means of our Mercury, and then reunited by the same agency, the whole mixture will, under the influence of fire, become our gold. But, if, without this preparatory purging, you were to use common gold with our Mercury for the purpose of preparing the Stone, you would be sadly mistaken; and this is the great Labyrinth in which most beginners go astray, because the Sages in writing of these ways as two ways, purposely obscure the fact that they are only one way (though of course the one is more direct than the other). The gold of the Sages may then be prepared out of our common gold and our Mercury, from which there may afterwards be obtained by repeated liquefactions, Sulphur and Quicksilver which is incombustible, and tinges all things else. In this sense, our Stone is to be found in all metals and minerals, since our gold may be got from them all --- but most easily, of course, from gold and silver. Some have found it in tin, some in lead, but most of those who have pursued the more tedious method, have found it in gold. Of course, if our gold be prepared in the way I have described, out of common gold (in the course of 150 days), instead of being found ready made, it will not be so effectual, and the preparation of the Stone will take 1 1/2 years instead of 7 months. I know both ways, and prefer the shorter one; but I have described the longer one as well in order that I may not draw down upon myself the scathing wrath of the "Sages." The great difficulty which discourages all beginners is not of Nature's making: the Sages have created it by speaking of the longer operation when they mean the shorter one, and *vice versa*. If you choose common gold, you should espouse it to Venus (copper), lay them together on the bridal bed, and, on bringing a fierce fire to bear on them, you will see an emblem of the Great Work in the following succession of colours: black, the peacock's tail, white, orange, and red. Then repeat the same operation with Mercury (called Virgin's Milk), using the "fire of the Bath of Dew," and (towards the end) sand mixed with ashes. The substance will first turn a much deeper black, and then a completer white and red. Hence if you know our Art, extract our gold from our Mercury (this is the shorter way), and thus perform the whole operation with one substance (*viz.*, Mercury); if you can do this, you will have attained to the perfection of philosophy. In this method, there is no superfluous trouble: the whole work, from beginning to end, is based upon one broad foundation --- whereas if you take common gold, you must operate on two substances, and *both* will have to be purified by an elaborate process. If you diligently consider what I have said, you have in your hand a means of unravelling all the apparent contradictions of the Sages. They speak of three operations: the first, by which the inward natural heat expels all cold through the aid of external fire, the second, wherein gold is purged with our Mercury, through the mediation of Venus, and under the influence of a fierce fire; the third, in which common gold is mixed with our Mercury, and the ferment of Sulphur added. But if you will receive my advice, you will not be put out by any wilful obscurity on the part of the Sages. Our sulphur you should indeed strive to discover; and if God enlightens you, you will find it in our Mercury. Before the living God I swear that my teaching is true. If you operate on Mercury and pure common gold, you may find "our gold" in 7 to 9 months, and "our silver" in 5 months. But when you have these, you have not yet prepared our Stone: *that* glorious sight will not gladden your eyes until you have been at work for a year-and-a-half. By that time you may obtain the elixir by subjecting the substance to very gentle continuous heat.

## **Chapter XX**

### **Of the Appearance of Blackness in the Work of the Sun and Moon**

If you operate on gold and silver, for the purpose of finding our Sulphur, let your substance first become like a thin paste, or boiling water, or liquid pitch; for the operation of our gold and Mercury is prefigured by that which happens in the preparation of common gold with our Mercury. Take your substance and place it in the furnace, regulate the fire properly for the space of twenty days, in which time you will observe various colours, and about the end of the fourth week, if the fire be continuous, you will see a most amiable greenness, which will last for about ten days. Then rejoice, for in a short time it will be as a black coal, and your whole compound shall be reduced to atoms. The operation is a resolution of the fixed into the not fixed that both afterwards, being conjoined, may make one matter, partly spiritual and partly corporal. Once more, I assure you, the regulation of the fire is the only thing that I have hidden from you. Given the proper-regimen, take the Stone, govern it as you know how, and then these wonderful phenomena will follow: The fire will at once dissolve the Mercury and the Sulphur like wax; the Sulphur will be burnt, and change its colours from day to day; the Mercury will prove incombustible, and only be gradually tinged (and purified, without being infected) with the colours of the Sulphur. Let the heaven stoop to the earth, till the latter has conceived heavenly seed. When you see the substances mingle in your distilling vessel, and assume the appearance of clotted and burnt blood, be sure that the female has received the seed of the male. About seventeen days afterwards your substance will begin to wear a yellow, thick, misty, or foamy appearance. At this time, you must take care not to let the embryo escape from your vessel; for it will give out a greenish, yellow, black, and bluish vapour and strive to burst the vessel. If you allow these vapours (which are continuous when the Embryo is formed) to escape, your work will be hopelessly marred. Nor should you allow any of the odour to make its way through any little hole or outlet; for the evaporation would considerably weaken the strength of the Stone. Hence the true Sage seals up the mouth of his vessel most carefully. Let me advise you, moreover, not to neglect your fire, or move or open the vessel, or slacken the process of decoction, until you find that the quantity of the liquid begins to diminish; if this happens after thirty days, rejoice, and know that you are on the right road. Then be doubly careful, and you will, at the end of another fortnight, find that the earth has become quite dry and of a deep black. This is the death of the compound; the winds have ceased, and there is a great calm. This is that great simultaneous eclipse of the Sun and Moon, when the Sea also has disappeared. Our Chaos is then ready, from which, at the bidding of God, all the wonders of the world may successively emerge.

## **Chapter XXI**

### **Of the Caution Required to Avoid Burning the Flowers**

The burning of the flowers is fatal, yet soon committed: it is chiefly to be guarded against after the lapse of the third week. In the beginning there is so much moisture that if the fire be too fierce it will dry up the liquid too quickly, and you will prematurely obtain a dry red powder, from which the principle of life has flown; if the fire be not strong enough the substance will not be properly matured. Too powerful a fire prevents the true union of the substances. True union only takes place in water. Bodies collide, but do not unite; only liquids (and spirits) can truly mingle their substance. Hence our homogeneous metallic water must be allowed to do its work properly, and should not be dried up, until this perfect mutual absorption has taken place in a natural manner. Premature drying only destroys the germ of life, strikes the active principle

on the head as with a hammer, and renders it passive. A red powder is indeed produced, but long before the time: for redness should be preceded by blackness. It is true that, in the beginning of our work, when heaven is wedded to earth, and earth conceives the fire of nature, a red colour does appear. But the substance is then sufficiently moist; and the redness soon gives way to a green colour, which in its turn gradually yields to blackness. Do not be in a hurry; let your fire be just powerful enough, but not too powerful; steer a straight course between Scylla and Charybdis: you will behold in your vessel a variety of colours and grotesque transformations --- until the substance settles down into a powder of intense blackness. This should happen within the first fifty days. If it does not, either your Mercury, or the regulation of your fire, or the composition of your substance is at fault --- if, indeed, you have not moved or shaken your glass vessel.

## **Chapter XXII**

### **Of the Regimen of Saturn**

All the Sages who have written on our Art, have spoken of the work and regimen of Saturn; and their remarks have led many to choose common lead as the substance of the Stone. But you should know that our Saturn, or lead, is a much nobler substance than gold. It is the living earth in which the soul of gold is joined to Mercury, that they may bring forth Adam and his wife Eve. Wherefore, since the highest has so lowered itself as to become the lowest, we may expect that its blood may be the means of redeeming all its brethren. The Tomb in which our King is buried, is that which we call Saturn, and it is the key of the work of transmutation; happy is he who can salute this planet, and call it by its right name. It is a boon which is obtained by the blessing of God alone; it is not of him that willeth, or of him that runneth; but God bestoweth it on whom He will.

## **Chapter XXIII**

### **Of the Different Regimens of this Work**

Let me assure you that in our whole work there is nothing hidden but the regimen, of which it was truly said by the Sage that whoever knows it perfectly will be honoured by princes and potentates. I tell you plainly that if this one point were clearly set forth, our Art would become mere women's work and child's play: there would be nothing in it but a simple process of "cooking." Hence it has always been most carefully concealed by the Sages. But I have determined to write in a more sympathetic and kindly spirit: know then that our regimen throughout consists in coction and digestion, but that it implies a good many other processes, which those jealous Sages have made to appear different by describing them under different names. But we intend to speak more openly in regard to this subject.

## **Chapter XXIV**

### **Of the First Regimen, which is that of Mercury**

This first regimen has been studiously kept secret by all the Sages. They have spoken of the second regimen, or that of Saturn, as if it were the first, and have thus left the student without guidance in those operations which precede the appearance of that intense blackness. Count Bernard, of Trevisa, says, in his Parable, that When the King has come to the Fountain, he takes off the golden garment, gives it to Saturn, and enters the bath alone, afterwards receiving from Saturn a robe of black silk. But he does not tell us how long it takes to put off that golden robe; and thus, like all his brethren, leaves the poor beginner to grope in the dark during 40 or 50 days. From the point where the stage of blackness is reached to the end of the work their directions are more full and intelligible. It is in regard to these first 40 days that the student requires additional light. This period represents the regimen of Mercury (of the Sages), which is alone active during the whole time, the *othersubstance* being temporarily dead. You should not suffer yourself to be deluded into the belief that when your matters are joined, namely, our Sun and Mercury, the "setting of the Sun" can be brought about in a few days. We ourselves waited a tedious time before a reconciliation was made between the fire and the water. As a matter of fact, the Sages have called the substance, throughout this first period, *Rebis*, or *Two-thing*: to shew that the union is not effected till the operation is complete. You should know, then, that though our Mercury consumes the Sun, yet a year after you shall separate them, unless they are connected together by a suitable degree of fire. It is not able to do anything at all without *fire*. We must not suppose that when our gold is placed in our Mercury it is swallowed up by it in the twinkling of an eye. This conception rests on a misunderstanding of Count Bernard's teaching about the King's plunge in the fountain. But the solution of gold is a more difficult matter than these gentry appear to have any idea of. It requires the highest skill so to regulate the fire in the first stage of the work as to solve the bodies without injuring the tincture. Attend to my teaching therefore. Take the body which I have shewed you, put it into the water of our sea, and bring to bear on the compound the proper degree of heat, till dews and mists begin to ascend, and the moisture is diminished night and day without intermission. Know that at first the two do not affect each other at all, and that only in course of time the body absorbs some of the water, and thus causes each to partake of the other's nature. Only part of the water is sublimed; the rest gradually penetrates the pores of the body, which are thereby more and more softened, till the soul of the gold is enabled gently to pass out. Through the mediation of the soul the body is reconciled and united to the spirit, and their union is signalized by the appearance of the black colour. The whole operation lasts about 40-50 days, and is called the Regimen of Mercury, because the body is passive throughout, and the spirit, or Mercury, brings about all the changes of colour, which begin to appear about the 20th day, and gradually intensify till all be at last completed in black of the deepest dye, which the both day will manifest.

## Chapter XXV

### The Regimen of the Second Part, which is that of Saturn

The Regimen of Mercury, the operation whereof despoils the King of his golden garments, is followed by the Regimen of Saturn. When the Lion dies the Crow is born. The substance has now become of a uniform colour, namely, as black as pitch, and neither vapours, or winds, or any other signs of life are seen; the whole is dry as dust, with the exception of some pitch-like substance, which now and then bubbles up; all presents an image of eternal death. Nevertheless, it is a sight which gladdens the heart of the Sage. For the black colour which is seen is bright and brilliant; and if you behold something like a thin paste bubbling up here and there, you may rejoice. For it is the work of the quickening spirit, which will soon restore the dead bodies to life. The regulation of the fire is a matter of great importance at this juncture; if you make it too fierce, and thus cause sublimation at this stage, everything will be irrecoverably spoilt. Be content,

therefore, to remain, as it were, in prison for forty days and nights, even as was the good Trevisan, and employ only gentle heat. Let your delicate substance remain at the bottom, which is the womb of conception, in the sure hope that after the time appointed by the Creator for this Operation, the spirit will arise in a glorified state, and glorify its body -- that it will ascend and be gently circulated from the centre to the heavens, then descend to the centre from the heavens, and take to itself the power of things above and things below.

## **Chapter XXVI**

### **Of the Regimen of Jupiter**

Black Saturn is succeeded by Jupiter, who exhibits divers colours. For after the putrefaction and conception, which has taken place at the bottom of the vessel, there is once more a change of colours and a circulating sublimation. This *Reign* or Regimen, lasts only three weeks. During this period you see all conceivable colours concerning which no definite account can be given. The "showers" that fall will become more numerous as the close of this reign approaches, and its termination is signalized by the appearance of a snowy white streaky deposit on the sides of the vessel. Rejoice, then, for you have successfully accomplished the regimen of Jupiter. What you must be particularly careful about in this operation, is to prevent the young ones of the Crow from going back to the nest when they have once left it; secondly, to let your earth get neither too dry by an immoderate sublimation of the moisture, nor yet to swamp and smother it with the moisture. These ends will be attained by the proper regulation of the outward heat.

## **Chapter XXVII**

### **Of the Regimen of the Moon**

When the Reign of Jupiter comes to an end (towards the close of the fourth month) you will see the sign of the waxing moon (Crescent), and know that the whole Reign of Jupiter was devoted to the purification of the Laton. The mundifying spirit is very pure and brilliant, but the body that has to be cleansed is intensely black. While it passes from blackness to whiteness, a great variety of colours are observed; nor is it at once perfectly white; at first it is simply white --- afterwards it is of a dazzling, snowy splendour. Under this Reign the whole mass presents the appearance of liquid quicksilver. This is called the sealing of the mother in the belly of the infant whom she bears; and its intermediate colours are more white than black, just as in the Reign of Jupiter they were more black than white. The Reign of the Moon lasts just three weeks; but before its close, the substance exhibits a great variety of forms; it will become liquid, and again coagulate a hundred times a day; sometimes it will present the appearance of fishes' eyes, and then again of tiny silver trees, with twigs and leaves. Whenever you look at it you will have cause for astonishment, particularly when you see it all divided into beautiful but very minute grains of silver, like the rays of the Sun. This is the White Tincture, glorious to behold, but nothing in respect of what it may become.

## **Chapter XXVIII**

## **Of the Regimen of Venus**

The substance, if left in the same vessel, will once more become volatile and (though already perfect in its way) will undergo another change. But if you take it out of the vessel, and after allowing it to cool, put it into another, you will not be able to make anything of it. In this Reign you should also give careful attention to your fire. For the perfect Stone is fusible and if the fire be too powerful the substance will become glazed, and unsusceptible of any further change. This "vitrification" of the substance may happen at any time from the middle of the Reign of the Moon to the tenth day of the Reign of Venus, and should be carefully guarded against. The heat should be gentle so as to melt the compound very slowly and gradually; it will then raise bubbles, and receive a spirit that will rise upward, carrying the Stone with it, and imparting to it new colours, especially a copper-green colour, which endures for some time, and does not quite disappear till the twentieth day; the next change is to blue and livid, and at the close of this Reign the colour is a pale purple. DO not irritate the spirit too much --- it is more corporeal than before, and if you sublime it to the top of the vessel, it will hardly return. The same caution should be observed in the Reign of the Moon, when the substance begins to thicken. The law is one of mildness, and not of violence, lest everything should rise to the top of the vessel, and be consumed or vitrified to the ruin of the whole work. When you see the green colour, know that the substance now contains the germ of its highest life. DO not turn the greenness into blackness by immoderate heat. This Reign is maintained for forty days.

## **Chapter XXIX Of the Regimen of Mars**

When the Regimen of Venus is over, and therein has appeared the philosophical tree, with all its branches and leaves, the Reign of Mars begins with a light yellow, or dirty brown colour, but at last exhibits the transitory hues of the Rainbow, and the Peacock's Tail. At this stage the compound is drier, and often shews like a hyacinth with a tinge of gold. The mother being now sealed in her infant's belly, swells and is purified, but because of the present great purity of the compound, no putridness can have place in this regimen, but Some obscure colours are chief actors, while some middle colours come and go, and they are pleasant to look on. Our Virgin Earth is now undergoing the last degree of its cultivation, and is getting ready to receive and mature the fruit of the Sun. Hence you should Weep up a moderate temperature; then there will be seen, about the thirtieth day of this Reign, an orange colour, which, within two weeks from its first appearance, will tinge the whole substance with its own hue.

## **Chapter XXX Of the Regimen of the Sun**

As you are now approaching the end of the work, the substance receives a golden tinge, and the Virgin's Milk which you give your substance to drink has assumed a deep orange colour. Pray to God to keep you from haste and impatience at this stage of the work; consider that you have now waited for seven months, and that it would be foolish to let one hour rob you of the fruits of all your labour. Therefore be more and more careful the nearer you approach perfection. Then you will first observe an orange-coloured sweat

breaking out on the body; next there will be vapour of an orange hue. Soon the body below becomes tinged with violet and a darkish purple. At the end of fourteen or fifteen days, the substance will be, for the most part, humid and ponderous, and yet the wind still bears it in its womb. Towards the 26th day of the Reign it will begin to get dry, and to become liquid and solid in turn (about a hundred times a day); then it becomes granulated; then again it is welded together into one mass, and so it goes on changing for about a fortnight. At length, however, an unexpectedly glorious light will burst from your substance, and the end will arrive three days afterwards. The substance will be granulated, like atoms of gold (or motes in the Sun), and turn a deep red --- a red the intensity of which makes it seem black like very pure blood in a clotted state. This is the Great Wonder of Wonders, which has not its like on earth.

### **Chapter XXXI**

#### **Of the Fermentation of the Stone**

I forgot to warn you in the last chapter to be on your guard against the danger of vitrification; too fierce a fire would render your substance insoluble and prevent its granulation. You now possess the incombustible red Sulphur which can no longer be affected in any way by fire. In order to obtain the Elixir from this Sulphur by reiterate solution and coagulation, take three parts of purest gold, and one part of this fiery Sulphur. Melt the gold in a clean crucible, and then cast your Sulphur into it (protecting it well from the smoke of the coals) Make them liquid together, when you will obtain a beautiful mass of a deep red, though hardly transparent. This you should permit to cool, and pound into a small powder. Of this powder take one part, and two parts of our Mercury; mix them well, and put them in a glass vessel, well sealed. They should be exposed to gentle heat for two months. This is the true fermentation, which may be repeated if needful.

### **Chapter XXXII**

#### **The Imbibition of the Stone**

Many authors take fermentation in this work for the invisible external agent, which they call ferment; by its virtue the fugitive and subtle spirits, without laying on of hands, are of their own accord thickened, and our before-mentioned fermentation they call cibation with bread and milk. But I follow my own judgment There is another operation, called Imbibition of the Stone, by which its quantity rather than its quality is increased. It is this: Add to three parts of your perfect Sulphur (either white or red) one part of water, and after six or seven days' coction the water will become thick like the Sulphur Add again as much water as you did before; and when this is dried up, with a convenient fire, add three distinct times so much water as shall be equal to one-third of the original quantity of Sulphur. Then add (for the 7th imbibition) five parts of water (the parts being equal to the original parts of the Sulphur). Seal up the vessel; subject it to gentle coction, and let the compound pass through all the different Reigns of the original Substance, which will be accomplished in a month. Then you have the true Stone of the third order, one part of which will perfectly tinge 1,000 parts of any other metal.

### **Chapter XXXIII**

## **The Multiplication of the Stone**

Take the perfect Stone; add one part of it to three or four parts of purified Mercury of our first work, subject it to gentle coction for seven days (the vessel being carefully sealed up), and let it pass through all the Reigns, which it will do very quickly and smoothly. The tinging power of the substance will thus be exalted a thousandfold; and if you go through the whole process a second time (which you can do with ease in three days) the Medicine will be much more precious still. This you may repeat as often as you like; the third time the substance will run through all the Reigns in a day, the fourth time in a single hour, and so on -- and the improvement in its quality will be most marvellous. Then kneel down and render thanks to God for this precious treasure.

### **Chapter XXXIV Of Projection**

Take four parts of your perfect Stone, either red or white (of both for the Medicine): melt them in a clean crucible. Take one part of this pulverisable mixture to ten parts of purified Mercury; heat the Mercury till it begins to crackle, then throw in your mixture, which will pierce it in the twinkling of an eye; increase your fire till it be melted, and you will have a Medicine of an inferior order. Take one part of this, and add it to a large quantity of well purged and melted metal, which will thereby be transmuted into the purest silver or gold (according as you have taken white or red Sulphur). Note that it is better to use a gradual projection, for otherwise there may be a notable loss of the Medicine. The better the metals are purged and refined, the quicker and more complete will the transmutation be.

### **Chapter XXXV Of the Manifold Uses of this Art**

He that has once found this Art, can have nothing else in all the world to wish for, than that he may be allowed to serve his God in peace and safety. He will not care for pomp or dazzling outward show. But if he lived a thousand years, and daily entertained a million people, he could never come to want, since he has at hand the means of indefinitely multiplying the Stone both in weight and virtue, and thus of changing all imperfect metals in the world into gold. In the second place, he has it in his power to make stones and diamonds far more precious than any that are naturally procured. In the third place, he has an Universal Medicine, with which he can cure every conceivable disease, and, indeed, as to the quantity of his Medicine, he might heal all sick people in the world. Now to the King Eternal, Immortal, and sole Almighty, be everlasting praise for these His unspeakable gifts and invaluable treasures. I exhort all that possess this Treasure, to use it to the praise of God, and the good of their neighbours, in order that they may not at the last day be eternally doomed for their ingratitude to their Creator.

*To God Alone be the Glory*

## **Aphorisms of Urbigerus**

*Aphorismi Urbigerani, Or Certain Rules Clearly demonstrating the Three Infallible Ways of Preparing the Grand Elixir or Circulatum majus of the Philosophers*  
*London, 1690*

### **To our Dear Disciples, Honor'd Coadepts, and all Well-Wishers to our Hermetic Art.**

Finding you, dear Sons who have through our means attained to the true knowledge of our first Matter, worthy to receive our farther Instructions in the remainder of the Process, to extirpate all such Ambiguities, as you may have conceived in our Absence, to facilitate your Labors, and to precaution you in the bringing your Work to its Highest Perfection. We here, according to your desire, expose to you, and for your sakes, to the Public, all the most infallible Rules, necessary for preventing of Errors in this great Undertaking And tho you, ever - honored Coadepts, could never yet so far prevail on yourselves as to come to a Resolution of presenting the World with the full Practice of this our Art, joined to the Theory, we are nevertheless most certain, that we shall not receive any Reprimand from you for bringing to light these our Rules which we have so penned, that even those, who know not our Person, will not only soon perceive, that all we have written, is the real Truth, clearly exhibiting both the Theory and Practice of the whole Hermetic Art, but also conclude, that these Operations must of necessity have very often passed through our own hands from our giving such positive Rules and infallible Instructions, elucidating all the most obscure and intricate Enigrns of time Philosophers, and warning them of all the Accidents, that may happen is the working of our Subject. We are, we say, confident, you neither will, nor can blame us for this: since you will easily discern, that our Design is purely to instruct our Disciples, and prevent all the Well-wishers to this most noble Art from being imposed upon, and cheated, by any false pretended Adept : to the end that those, who shall from the Divine Benignity, by the help of these our Aphorisms, or otherwise, have received the blessed knowledge of our first Matter, which is the very same in all our three ways of producing the grand Elixir, may through these our certain Rules obtain the accomplishment of their Desires.

Having in our Travels fortun'd to meet with some Persons of true Principles in Philosophy and Religion, we could not but embrace them and instruct them towards its farther Perfection, which cannot be attained without the true knowledge of our Celestial Art. by which comprehending all the Mystery of Mysteries, we learn also how to serve God in Faith and Truth. And since we have no Obligation to any living Soul for time knowledge, we possess, having attained it all by the only Blessing of Almighty God on our Industry and Experiences being therefore at more liberty than those, who receive such a Favor from us, or some other Adept, 'tis our Determination, whenever we meet with Persons so qualified, always to do the same. Wherefore being at present in England though we are no Native of this Kingdom we think it necessary to set forth these our Aphorisms in the English tongue not in the least doubting, but that the Knowing, minding only the sense, will easily pardon any Impropriety, they may find in our Expressions: and when Providence shall carry us into any other Country, we, having attained to some competent Knowledge of most European Languages, shall again take care to publish them in the Speech of the Place, where we shall be. that we may the sooner obtain the effects of our Desires, which aim at nothing, but the undeceiving of the World by setting down certain and evident Marks, distinguishing the Worthy from the Unworthy, and at the bringing of Men to leave their unnecessary Forms, by instructing them in the true way of Serving God, being the only means to render them happy both in this World, and the next.

## Aphorismi Urbigerani

I. The Hermetic Science consists only in the right knowledge of the first Matter of the Philosophers which is in the Mineral kingdom not yet determined by Nature.

II. An undetermined Matter being the beginning of all Metals and Minerals, it follows, that as soon as any one shall be so happy, as to know and conceive it, he shall easily comprehend also their Natures, Qualities, and Properties.

III. Although some Persons, possessed with foolish Notions, dream, that the first Matter is to be found only in some particular places, at such and such times of the year, and by the Virtue of a Magical Magnet; yet we are most certain (according to our Divine Master Hermes) that, all these Suppositions being false, it is to be found every where, at all times and only by our Science.

IV The Hermetic Art consists in the true Manipulation of our undetermined Subject, which before it can be brought to the highest degree of Perfection, must of necessity undergo all our Chymical Operations.

V. Our Chymical Operations are these Amalgamation Sublimation, Dissolution Filtration, Cohobation, Distillation, Separation, Reverberation, Imbibition, and Digestion.

VI. When we call all these Operations ours, they are not all to be understood according to the common Operations of the Sophisters of Metals, whose Industry consists only in disguising of Subjects from their Form, and their Nature: but ours are really to transfigure our Subject, yet conserving its Nature, Quality, and Property.

VII. This our Subject, after its having passed through all those artificial Operations, which always imitate Nature, is called the Philosophers Stone, or the fifth Essence of Metals, being compounded of the Essence of their four Elements.

VIII. Time Metals and Minerals, which Nature already determined, although they should be retrograded into running Mercury Water, and Vapor; yet can they by no means be taken for the first Matter of the Philosophers.

IX. Our true and real Matter is only a Vapor, impregnated with the Metallic Seed, yet undetermined, created by God Almighty, generated by the Concurrence and Influence of time Astrums, contained in the Bowels of the Earth, as the Matrix of all created things.

X This our Matter is called undetermined, because, being a Medium between a Metal and a Mineral, and being neither of them, it has in it power to produce both, according to the Subject, it meets withal.

XI. Such a Metallic Vapor, congealed and nourished in the Bowels of the Earth. is called the undermined, and when it enchants the Serpent with the Beauty of its terminated and additional Fire, the determined Green - Dragon of the Philosopher and without the true knowledge and right Manipulation of it nothing can be

done in our Art.

XII. This Green-Dragon is the natural Gold of the Philosophers, exceedingly different from the vulgar, which is corporeal and dead, being come to the period of its Perfection according to Nature, and therefore incapable of generating, unless it be first generated itself by our Mercurial Water but ours is spiritual, and living, having the generative Faculty in itself, and in its own Nature, and having received the Masculine Quality from the Creator of all things .

XIII. Our Gold is called Natural, because it is not to be made by Art, and since it is known to none, but the true Disciples of Hermes, who understand how to separate it from its original Lump, 'tis called also Philosophical; and if God had not been so gracious, as to create this first Chaos to our hand, all our Skill and Art in the Construction of the great Elixir would be in vain.

XIV. Out of this our Gold, or undetermined Green-Dragon, without the addition of any other created thing whatsoever, we know how through our Universal Menstruum to extract all our Elements. or Principles, necessary for the performance of our great Work: Which is Our first way of preparing the Grand Elixir and since this our first Chaos is to be had without any Expense, as costing only the trouble of digging it out of the Mines, This is not unfitly called the only way of the Poor.

XV The Operations in this our first way being in a manner the same with those of our second, which is, when we join our determined Dragon with our Serpent, we shall (to avoid Repetitions) in the subsequent Aphorisms give Instructions for them both together.

XVI. Our Serpent, which is also contained in the Bowels of the Earth, being of all created things whatsoever the nearest subject of a Feminine Nature to our Dragon, through their Copulation such an astral and metallic Seed, containing our Elements, is also to be brought forth as can, though with somewhat more of Expense and Time, perform the whole Mystery of Hermes.

XVII. Since our Serpent is of all created things the nearest subject of Feminine Nature to our Dragon, she is after her Copulation to be taken for the Basis of our Philosophical Work: for out of her Bowels, without the help of any other Metal or Mineral ,we must draw our Principles or Elements, necessary to our Work, being retrograded by the Universal Menstruum.

XVIII. This Feminine Subject cannot be retrograded, unless to free her from her Impurities, and Heterogeneous Qualities, she is first actuated by her Homogeneous ones, that she may be in better Capacity to receive the spiritual Love of our Green Dragon.

XIX After our Serpent has been bound with her Chain, penetrated with the Blood of our Green-Dragon, and driven nine, or ten times through the combustible Fire into the elementary Air, if you do not find her to be exceeding furious, and extremely penetrating,, 'tis a sign, that you do not hit our Subject, the Notion of the Homogenea, or their Proportion.

XX If this furious Serpent, after it has been dissolved by the Universal Menstruum, filtrated, evaporated, and congealed nine or ten times, does not come over in a Cloud, and turn into our Virgin Milk, or Metallic argentin Water, not corrosive at all, and yet insensibly, and invisibly devouring every thing, that comes near it, 'tis plainly to be seen that you err in the Notion of our Universal Menstruum.

XXI. The Serpent, of which I now speak, is our true Water of the Clouds, or the real Eagle and Mercury of the Philosophers, greatly different from the Vulgar, which is corporeal, gross, dead, and full of Heterogeneous Qualities, and a Subject fallen from its Sphere, like unripe Fruit from the Tree; but ours is spiritual, transparent, living, residing in its own Sphere, like a King on his Throne

XXII. Though the vulgar Mercury is such an unripe fruit, corporeal, and dead; yea, if you know how to amalgamate it with our Dragon, and to retrograde it with the Universal Menstruum, you may assure your self, that out of this also you shall be able to prepare a Sophic Mercury, with which you shall certainly produce the great Elixir, discover the Secret of Secrets, unlock the most difficult Locks, and command all the Treasures in World.

XXIII. Our Mercury is called the Mercury of the Philosophers, because it is a Subject, which is not to be found ready prepared to our hand : for it must of necessity be made by our Philosophical Preparations, out of the first Chaos, and although it is Artificial, yet it is naturally prepared, Nature, which is imitated in the Preparation of it, contributing likewise thereunto.

XXIV. Since our Subject cannot be called the fiery Serpent of the Philosophers, nor have the power of overcoming any created thing, before it has received such Virtue and Quality from our Green-Dragon, and the Universal Menstruum, by which itself is first overcome, devoured, and buried in their Bowels, out of which being born again, 'tis made capable of the same, it follows, that such a Virtue of killing and vivifying is natural to our Dragon and the Universal Menstruum.

XXV. The Universal Menstruum of the Philosophers is that Celestial one, without which nothing can live nor subsist in this World: 'tis also that noble Champion, which delivers time uncorrupted Virgin, Andromeda, who was with a strong Chain fastened to the: Rock in the power of the Dragon, of whole spiritual Love having admitted, for fear of being eternally ruined and devoured by him (which could not have been avoided, if this noble Champion had not come to her assistance) She is to be delivered of a Child, which will be the Wonder of Wonders, and Prodigy of Nature.

XXVI. If our Virgin in her Confinement, before she is set at liberty, does not manifest her extreme Beauty with all her internal, divers, delicate natural Colors wonderfully charming, and very pleasant to the Eye, it signifies, that she has not sufficiently enjoyed the spiritual Company of the Dragon.

XXVII. If the Universal Menstruum has not totally delivered the Virgin from the Claws of the Dragon, it is a sign, either that she was not sufficiently free from her Heterogeneous Qualities, or that she had not received from the external Heat a sufficient penetrating Quality, or that the Universal Menstruum was too weak to perform its Undertaking.

XXVIII. To know, whether the Amalgamation, Sublimation, Dissolution, Filtration, Coagulation, and Distillation have been Natural and Philosophical, the whole Body of the Serpent must come over spiritual and transparent, leaving only some few and very light Feces at the bottom, which can by no Art be reduced! - either into a running Mercury, or and other kind of metallic Substance.

XXIX. After all these above-mentioned Operations, and the Separation, if our Serpent, being amalgamated with any Metal, pure or impure, cannot suffer the Fusion, it will be in vain for you to go any farther with it:

for you may assure your self, that you do not walk in the true Paths of the Hermetic Art.

XXX. Our Philosophical Distillations consist only in the right Separation of our Spiritual and Mercurial Water from all its poisonous oily Substance, which is of no use at all in our Art, and from though Caput Mortuum, which is left behind after the first Distillation.

XXXI. If after the first Distillation an exceedingly corrosive and extremely penetrating red Oil does not ascend (which as soon as it begins to appear in the Neck of the Retort, the Receiver must be changed it signifies that the Distillation has not been rightly performed, and by Consequence, that the internal Fire of our metallic vaporous Water, being burnt up, and corroded by its poisonous Vapor, and the outward Fire, is still mixed with it, and with the Caput Mortuum.

XXXII . In case you should commit so great an Error in the performance of this first Distillation, although it will never be in your power to prepare the Mercury Duplex of the Philosophers, unless you should begin the whole World ager; from the very beginning; yet, if you have any farther Skill in our Art, you may easily prepare our Mercury Simplex, with which you will effect great and miraculous things.

XXXIII. This blood red Oil with its only Fumes penetrates every Part and Atom of all Metals and Minerals, and principally of Gold out of which Dissolution one may easily extract the right Tincture or Essence with highly rectified Spirit of Wine, and bring it over the Alembic with it: which is indeed a great Medicine for humane Bodies.

XXXIV. A deep blood-red Tincture of excellent Virtue is to be extracted also out of the above-mentioned Caput Mortuum. accidentally and unfortunately intermixed with the internal Sulfur of our Mercurial Water, and with the red Oil, with highly rectified Spirit of Wine : with which after it has been evaporated to a Powder, imbibed, and Philosophically digested, you may assure your self of having the Medicine of Medicines, next to the great Elixir, by which you may, imperceptibly and quickly cure all sorts of Distempers, to the great Admiration. Of all Galenists, and to the Astonishment of all Vulgar Chymists.

XXXV. The most part of the Philosophers, whilst their Intention was to go farther to the noblest Perfection of our Celestial Art, either employed this red Oil brought to a Potability, for internal Medicines, or to external Diseases without any farther Preparation of it, till they had obtained the great Elixir.

XXXVI. If the Caput Mortuum has not the Magnetic Quality in attracting the Spiritus Mundi into itself from the Astrums, it is a sign, that at time end of the Distillation of the red Oil the outward fire was so violent, as quite to burn up the Magnet, which is contained in the first Feces of our Mercurial Water.

XXXVII. After the first Distillation, if the least Part of the Virgin Mercurial Water can by any Art whatsoever be brought to running Mercury, or any other kind of a Metallic Substance, it is an evident sign, that either the Subject, or its Preparation and Reduction into Water, has not been real, natural, or Philosophical.

XXXVIII. The above-mentioned Spiritus Mundi, although of no use at all in this our great Work, is yet a great Menstruum in extracting of Tinctures out of Metals, Minerals, Animals, and Vegetables, and in performing great things in the Art volatilizing all fixed Bodies, and principally Gold.

XXXIX. A great many Pretenders to the true Hermetic Knowledge prepare Menstruums, to dissolve common Mercury, and to turn it into Water several manner of ways, and by several additions of Salts, Sulfurs, Metals, and Minerals. but, since all those Preparations are sophistical, any one, expert in our Art, will be able to reduce it to its running Quality again.

XL. The Quality of our Mercurial Water: being to volatilize all fixed Bodies, and to fix all those, that are volatile, fixing It self with those, that are fixed, according to the Proportion of it, dissolving its own Body, it unites inseparably with it, conserving always its own Qualities and Properties, and receives no Augmentation from any other created thing, but only from its crude Body.

XLI. Our Mercurial Water has such a sympathy with the Astrums, that, if it is not kept very close, and Hermetically sealed, it will in a very short time, like a winged Serpent, fly away in a wonderful manner to its own Sphere, carrying along with it all the Elements and Principles of Metals, and not leaving so much as one single drop, or the least remainder, behind.

XLII. Several Pretenders to the Magical Science prepare Magical Magnets, to draw from the Air, and (as they pretend) from the Astrums such Menstruums, as they think necessary for the Production of the Great Elixir; but their Magnets being compounded of several determinate things, although their Menstruums are great Dissolvents yet we do on assured knowledge affirm that they can never perform any real Experiments in our Art.

XLIII. Some are of Opinion, that, unless the Operator is Master in the Magical Science, and fundamentally understands all its Experiments, he will never be able by any other Art whatsoever to bring forth any such things, as can produce the Universal Elixir. Now, although we do not deny, that the Magical Knowledge is required to attain to the highest degree of Perfection in all Sciences, yea; we are most certain, that it is not at all necessary to the Formation of the Grand Elixir upon Animals, Metals, Precious Stones, and Vegetables.

XLIV. Our Virgin Milk, or Metallic Water, being brought to a perfect Spirituality, and excellent Diaphanity, is called the true Chaos of the Philosophers: for out of that alone, without any addition of any created, or artificially prepared thing, we are to prepare and separate all the Elements, which are required to the Formation of our Philosophical Microcosm.

XLV. To understand aright, how out of this our Chaos we are to form our Philosophical Microcosm, we must first of necessity rightly comprehend the great Mystery and Proceeding in the Creation of the Macrocosm: it being extremely necessary to imitate and use the very same Method in the Creation of our little one, that the Creator of all things has used in the Formation of the great. One.

XLVI. When our Chaos or Celestial Water has purified itself from its own gross and palpable Body, it is called the Heaven of the Philosophers, and the palpable Body the Earth, which is void, empty, and dark : And if our Divine Spirit, which is carried upon the face of the Waters, did not bring forth out of the palpable Body that precious Metallic Seed, we should never be able by any Art whatsoever to go on any farther with time perfect Creation of our Microcosm according to our Intent.

XLVII. This Heaven of the Philosophers, after it has separated itself from the Earth, containing our Philosophical Seed, and the Magnet of our Salt of Nature, and from the superfluous Waters, is called the Mercury simplex of the wise men. for whosoever attains it, at the same time attains also the Knowledge and

Power of retrograding Metals, Minerals, &c. so as to reduce them to their first Being, to perfect imperfect Bodies, and to vivify dead ones, conserving always its own Property and Quality to it self, and to produce the Great Elixir according to the usual ways of the Philosophers.

XLVIII. After we have separated the Water from the Water, by which I mean the Mercurial Celestial Water from the superfluous Water, which is the Flegm, by the Blessing of God and the Infusion of our holy Spirit, we do not in the least doubt, but we shall be able to bring forth out of our Earth such Fruits and Subjects, with which we shall certainly perform the whole Creation, carrying our Work to the highest Degree of Perfection.

XLIX. Our Mercurial Water being of the: same Brightness with the Heavens, and our palpable gross Body, which did separate it self from our Celestial Water. having the same Properties and Quality with the Earth, none, but Ignorance, will deny them to be the right Heaven and true Earth of the Philosophers.

L. If, after the Separation of the Spirit from the superfluous Waters, the World, in which it is contained, does not appear mighty clear, and full of light, and of the same brightness with our Celestial Water, it is a sign, that the Separation is not fully performed, the Spirit being still intermixed with the Waters.

LI. If in the space of nine or ten Weeks, or two Philosophical Months at longest, our Mercurial Water has not done separating it self from all its own Earth containing the Metallic Seed, it is an evident sign, that you have either erred in the working of it, or that its Digestion, having been too violent, has confounded and burnt up the principal Subject of the Creation.

LII. This Philosophic Earth, containing our principal Subject, after it has been separated from all the Waters, is very gently to be dried by some external Heat, to free it from its extraneous Humidity, that it may be in a proper Capacity to receive the Celestial Moisture of our Argentin Water, to which it unites its most noble Fruits, with which our Philosophical Microcosm is generated, nourished, and saturated.

LIII. If the Earth, after it has been reverberated, humected with our Celestial Moisture, does not presently enrich our Air with the divine expected Fruits, you must certainly believe, that in the drying of it the external Heat has been so violent, as to burn up the internal Head and Nature of the Earth, and consequently spoil your Undertaking as to the performance of the whole Mystery of the Creation, according to the noblest, richest, shortest, most natural, and secretest ways of the Philosophers.

LIV. In case the Earth should be totally destroyed by the violent external Heat, although it is most certain, you cannot carry on our noble Creation any farther with it; yet if you know how to amalgamate our Mercury simplex with your common Gold, which is dissolved, vivified, and renewed by it, you may be sure of effecting the Great Elixir, although neither so quick. So natural, nor so rich, as you might have done without it. And this is our third way.

LV. The Amalgamation of our Mercury simplex with common Gold consists only in the right Proportion, and in the indissoluble Union of both, which is done without any external Heat in a very short time, without which exact Proportion and right Union nothing of any Moment is to be expected from their Marriage.

LVI. Know then, that this right Proportion is ten parts of our Mercury simplex to one of your finest common Gold in filings, which is dissolved in it, like Ice in common Water, after an imperceptible manner,

and as soon as the Dissolution is over, the Coagulation and Putrefaction presently follow, which Effect, it you find not, 'tis a sign, that the Mercury exceeds its due Proportion. Now when your Gold has been thus well amalgamated, united, putrefied, and inseparably digested with our Mercury simplex, you will then have only our Philosophical Sulfur, in which time one might easily have performed the whole Work, working without common: Gold.

LVII. Although our Mercury simplex is exceedingly spiritual and volatile, yet since it is the right Agent, digesting the Seed or Essence of all Metals and Minerals it will, though undigested, naturally adhere to any of them although corporeal, that shall come near it, and will never leave it, unless it be forced away by the Test, though kept in a great Fusion for many hours.

LVIII. This Mercury simplex, which before its retrogradation was of a Feminine Nature, and before it left all its own Earth, was Hermaphroditic, being powerful in both Sexes, is now become of a Feminine Quality again, and although it has lost the Masculine visible Fire. yet it has conserved its own, which is invisible to us, and with which it performs visible Operations in digesting of imperfect Metals, after its Determination with any of them.

LIX. If this our Mercury (the Proportion rightly observed) should be amalgamated with any imperfect Metal, being first determined with a fixed one, it will regenerate and perfect the same, not losing the least Particle of its Virtue or Quantity: Which Metal after the digestion of a Philosophical Month will (as most Philosophers teach) be able to resist all manner of Tryals, and will be far better than any Natural one.

LX. The Determination of our Mercury simplex with any of the fixt Bodies is to be done by dissolving a small quantity of Filings of red or white according to the Color and Quality of the Metal, that you desire to meliorate, and if you do not err in the Separation and Union of the Subjects, you may assure your self of obtaining your desire after a Philosophical Digestion.

LXI. To examine aright, whether the Mercury simplex is rightly prepared, or come to its Perfection, one only Drop, put upon a red-hot Plate of Copper, must whiten it through and through, and must not part with it, although brought into a great Fusion: Which, if you find, it does not, it will be a plain Demonstration, that either your Mercury is not well prepared, or that it has not yet done separating itself from its own Earth.

LXII. If your Mercury simplex, put upon its own dried Earth, does not presently unite with the Essence of Metals, appearing deeper than any Blood, and shining brighter than any Fire, which is a mark of the Reception of its own internal Fire, and that the Eagle has suckt the Blood of our Red Lion, it is an evident sign, that you have erred in the Manipulation of the Earth.

LXIII. This Mercury, thus impregnated with its Essence, or Sulphur of Metals, is called the Mercury duplex of the Philosophers, which is of a far greater Quality, and Virtue than the simplex, with whose Imbibitions in the Salt of Nature, after its being saturated with the simplex, the whole Mystery of the Creation of the Philosophical Microcosm is maintained and perfected.

LXIV. To know, whether your Mercury duplex is Philosophically prepared, and sufficiently impregnated with its own internal Natural Fire, put one single Drop of it upon a red-hot Plate of fine Silver: and if the Silver is not by this Drop penetrated through and through with a deep-red Tincture, enduring the greatest fire of Fusion, it will signifie, that you either fail in the Preparation of it, or that you have not given it time

enough to receive a full Saturation out of its own Earth.

LXV. This deep-red Tincture, extracted out of our Philosophical Earth, is called our Sulphur, our undigested, essentificated Gold, our internal elementary Fire, and our Red-Lion: for without its Help and Concurrence our Philosophical World cannot be nourished, digested, or accomplished, being the right Ground, and true Essence of the whole work of our Creation.

LXVI. When the Earth has lost its Soul, the remainder of it is the true Magnet, attracting the Salt of Nature from the combustible Fire after a violent Calcination for several hours: which Salt, after its Purification and Clarification, is called the clarified Earth or Salt of the Philosophers, which, Uniting it self with our single and double Mercury, after their Digestion, is called by our Master Hermes the Universal Spirit earthified.

LXVII. The Extraction, Purification, and Clarification of our Earth or Salt of Nature is to be performed by our Mercury simplex: which being put upon the reverberated Earth, will presently draw to it self, and unite it self with it, yet separable by gentle Distillation, after which the clarified Salt of the Philosophers is at hand.

LXVIII. Although we use our Mercury simplex in the Extraction of its own Soul out of its Body, and for the Clarification of the latter; yet, since it is a philosophical and perpetual Menstruum, it loses nothing of its connatural Prerogatives, nor does in the least diminish in Quantity, being our true Alkahest, as Paracelsus is pleased to call it.

LXIX. Those three Principles, or Elements of our Chaos, perfectly separated from their Impurities, and brought to their highest Perfection, are rightly called the three Herculean Works: for after the Preparation of them all the Labor, Trouble, and Danger will be past.

LXX. Some foolish Operators pretend, that our Great Elixir is to be prepared in a very easie manner, and without any trouble at all, to whom we will with our Master Hermes, briefly answer, That such Impostors neither know our Matter, nor the right Preparation of it. Yet we do not deny, but any Healthy Person, of what Age soever he may be, may understand all our Herculean Labors, necessary to the Performance of it.

LXXI. These our Operations are therefore called Herculean in respect to the rest of the Work, which is exceeding easie, and without the least Trouble or Danger, being for that reason called Childrens Play, because a Child or a Woman, that has any Sense, may easily work it, and bring it to the highest Perfection, according to the Saying of all true Philosophers.

LXXII. Although all those above-mentioned Operations are, according to the common Opinion of the Philosophers, esteemed difficult, and dangerous; yet we can upon our Conscience assure you, that we have our self alone without the help of any Creature living prepared them all on a common Kitchin Fire, as is very well known to several Coadepts, our Friends, who could not but admire and approve of our Industry.

LXXIII. No true Adept or perfect Artist can deny, but that the whole Work of the Great Elixir may from the very beginning to the end be performed on one only Furnace, in one only sort of Vessel, and by one only Person alone, at a very small charge.

LXXIV. Some Impostors would perswade the Vulgar, that Gold, Silver, and many other Ingredients are

required to the making of the Grand Elixir according to our noblest ways: which the Doctrines of all the Philosophers, and our own infallible Rules clearly shew to be false: for 'tis most certain, that we neither use any of their Ingredients, nor yet any Silver or Gold, (unless, as we have mentioned, in our third way) till we come to the Fermentation of our Elixirs.

LXXV. We do with all true Philosophers assure you, that all things, necessary for our Philosophical Work, besides the Fewel, Vessels, and some new Instruments, belonging to the Furnace, are to be purchased for less than the Expence of one single Guinea, and that every where, and at all times of the year.

LXXVI. Since neither Gold nor Silver is to be used at all in the Formation and Cibation of our Philosophical Work, it follows, that the old and common saying of some Authors, viz. That without working with Gold 'tis an impossible thing to make Gold, proved to be only a false Notion of Men, who understand not our Art.

LXXVI. When our Herculean Works are brought to Perfection, which is, when our three Principles, or Elements are prepared, purified and perfected, unless the Philosophical and unseparable Union of them is exactly performed, the Great Mystery of our Creation is not to be expected.

LXXVIII Our Principles or Elements being brought to a perfect and unseparable Union and Digestion, it is called the Triple Mercury of the Philosophers, which being finished, the whole Creation and Formation of our work is crowned.

LXXIX All our Work of the Creation from its very Beginning to its perfect End may, on our certain knowledg, be perfected in less than nine Months by any skilful and careful Artist, that follows our Rules, unless some Accident should happen in the Preparation of our Herculean Works: which to prevent, we wrought them our self in an earthen Vessel, which we count far better and surer than any Glass, and which is most agreeable to the Practice of the most ancient Philosophers.

LXXX. Before you come to the Union of your Elements, your clarified Earth is before all things to be digested in a moderate and continual Heat of Ashes, to free it from any unnatural Moisture, that it might have attracted after its Purification, to be in a fit Capacity to receive your Mercury simplex, by which it is to be nourished in its Infancy.

LXXXI. If your clarified Earth, after it has been digested the space of a whole Month, does not appear exceeding dry, subtil, and frangible, it will signifie, that you have failed in the Purification or Clarification of it, or that the external Moisture, it had attracted, is not yet parted from it.

LXXXII. Take great Care, that you do not begin your Imbibitions of your Earth, before you find it to be very well purified, clarified, dried, and brought to be very subtil, and extremely frangible: for it would be a great Detriment as well to your Work, as to your Mercury; and, although it should not spoil your Work, yet it would be to you a great loss of Time.

LXXXIII. After our clarified Earth had been brought to a perfect Purity, Dryness, and Frangibility, it is to be imbibed with the eighth part of our Mercury simplex, or Virgins Milk, which will in a very short time be soaked into it, as into a Sponge, which shews the hungry State of our Infant, and then the Fire is to be continued, till the Infant is hungry again.

LXXXIV. If in the space of two or three days, or four, at the farthest, the Infant does not shew it self to be extreme hungry by becoming very dry and frangible again, it will become an evident sign, that you have overcome it by your excessive feeding of it.

LXXXV. Great care is to be taken also in the feeding of the noble Infant: for if you do not well observe all our infallible Rules, you will never be able to bring it to a perfect Maturity: for in the Notion and Proportion of our Imbibitions, and the Management of them, the prosperous and unfailable End of our Work is to be expected.

LXXXVI. 'Tis always to be observed, that the Fire be very moderate, as long as you are making your Imbibitions, for fear or forcing any part of your Mercury to leave the Earth: for as a moderate Heat makes the Union between the Soul and the Body, and perfects all the Work: so on the contrary a too Violent Heat disunites and destroys all.

LXXXVII. The Infant being dry, the Imbibition is to be repeated again, and this Method is to be used, until the Matter has received its weight of the Mercury: at which time if you do not find it to flow like Wax, and be whiter then any Snow, and very fixt, you must proceed with your Imbibitions, until you perceive the same.

LXXXVIII. The Imbibitions are not to be made any oftner, than once every three or four days, in which time you will find your Matter, having soaked up all your Mercury, to be in great want of Food, which must be supplied, until it be saturated: the Mark of which will be, when it flows like Wax again.

LXXXIX. Your Matter being brought to a perfect Fluxibility, uncomparable Whiteness, and unalterable Fixedness, know then, that you have perfected the white Elixir, which, being fermented with fine Silver in Filings, will be in a Capacity to transmute all inferior Metals into the finest Silver in the World.

XC. Before the white Elixir is fermented with common Silver, you may multiply it, as well in Virtue, as in Quantity, by the Continuation of Imbibitions with the Mercury simplex, by which it may by Degrees be brought ad Infinitum in its Virtue.

XCI. The white Elixir being brought to its Degree of Maturity, desiring to go on to its highest Degree of Perfection, instead of fermenting it with Silver, it must be cibated with its own Flesh and Blood, which is the double Mercury, by which it being nourished, multiplied in Quality and Quantity, and digested, the whole Work is accomplished.

XCII. As soon as the first Imbibition is made, you will see a great Alteration in your Vessel: for there will be nothing seen but a Cloud, filling the whole space of the Vessel, the fixt being in controversie with the Volatil, and the Volatil with the fixt. The Volatil is Conqueror at the beginning, but as last by its own internal Fire, conjoynd with the external, both are united, and fixed inseparably together.

XCIII. It is to be observed, that the Glass Vessel, which must be oval, with a Neck half a foot long, and very strong, be of a fit bigness, and of such Capacity, that your Matter, when it is put into the Vessel, may take up only the third part of it, leaving the other two vacant: for, if it should be too big, it would be a great hinderance in performing the Work, and if too little, it would break into a thousand pieces.

XCIV. After you have cipated the noble Elixir with your double Mercury, before it can come to its perfect Fixedness, it must of necessity wander through all the States and Colours of Nature, by which we are to judg its Being and Temperament.

XCV. The constant and essential Colors, that appear in the Digestion of the Matter, and before it comes to a Perfection, are three, viz. Black, which signifies the Putrefaction and Conjunction of the Elements; White, which demonstrates its Purification; and Red, which demonstrates its Maturation. The rest of the Colors, that appear and disappear in the Progress of the Work, are only accidental, and unconstant.

XCVI. By every Cibation of its own Flesh and Blood, Regeneration of its Colors, and Digestion, the Infant will grow stronger and stronger, that at last being fully saturated and digested, it is called the Great Elixir of the Philosophers, with which you will be able to perform, Wonders is all the Regions, as well Animal, as Mineral, and Vegetable.

XCVII. When your Elixir is brought to a Fluxibility, and a perfect Fixedness, if you desire to make a Medicine upon Metals, you must determinate or ferment it with common Gold in Filings, in which Determination it will vitrify, and then you will have an incomparable Medicine, capable to transmute all imperfect Metals into the purst Gold, according to the Doctrine of all the Philosophers, though our self never designed any thing, but an universal Remedy for the Cure of all curable Diseases, incident to Human Bodies, as is well known to our Friends, who have enjoyed the Benefit of these our Labors.

XCVIII. It is to be observed in the Fermentation, that the Elixir exceed not the Ferment in Quantity, otherwise the Sponsal Ligament of it cannot be actually performed, and when the Ferment is predominant over the Elixir, all will be presently turned into dust.

XCIX. The best Method of Fermentation is to take one part of the Elixir, and put it into the midst of ten parts of Gold in Filings, cast through Antimony, to free it from all its Impurities, and to keep it in a circulary Fire for the space of six Hours, so increasing the Fire by Degrees, that the last two hours it be in a good Fusion, and when cold, you will find all your Matter exceeding frangible, and of the Color of the Granate-Stone.

C. Common Mercury, amalgamated with Lead, is counted the most proper Subject for making Projection, which being in Fusion, your fermented Matter being divided into three parts, one part of it rolled, in Wax, is to be flung upon the Amalgam: then presently cover the Crucible, and continue the Fire, until you hear the Noise of the Separation and Union: then the second and third part, as before, and being kept for two hours in a continual Fire of Fusion, let it cool by it self.

CI. Whoever shall presume to prepare the Great Elixir according to our most Secret Ways without following and observing all these our infallible Rules, will certainly find himself mightily mistaken at last, having after a great deal of Troubles, Charges, and Pains, reaped nothing but Discontent; and on the contrary they, that shall walk in our true and infallible Paths, shall with very little Trouble and Expences attain to their desired End, which we cordially wish to all those, who are sincere well-wishers to the Hermetic Philosophy.

# Aula Lucis, or, The House of Light.

Thomas Vaughan

*Aula lucis, or, The House of Light: A discourse written in the year 1651...* London, Printed by William Leake, 1652. This transcription has been made from the A.E. Waite edition of the works of Thomas Vaughan, rather than from the original edition.

---

## Aula Lucis Thomas Vaughan

To Seleucus Abantiades

What you are I need not tell you: what I am you know already. Our Acquaintance began with my childhood, and now you see what you have purchased. I can partly refer my inclinations to yourself, and those only which I derive from the contemplative order; for the rest are beside your influence. I present you with the fruits of them, that you may see my light has water to play withal. Hence it is that I move in the sphere of generation and fall short of that test of Heraclitus: "Dry light is best soul." I need not expound this to you, for you are in the centre and see it. Howsoever, you may excuse me if I prefer conceptions to fancies. I could never affect anything that was barren, for sterility and love are inconsistent. Give me a knowledge that is fertile in performances, for theories without their effects are but nothings in the dress of things. How true this is you can tell me. If I but recite what is your own you must not therefore undervalue it, being in some sense a sacrifice; for men have nothing to give but what they receive. Suffer me then at the present to stand your censer and exhale that incense which your own hands have put in. I dare not say this is revelation, not can I boast with the prodigious artist you read of that I have lived three years "in the realm of light." It is enough that I have light, as the King of Persia had his Bride of the Sun; and truly, I think it happiness to have seen that candle lodged which our fathers judged to be wandering light, a light seeking habitation. But I grow absurd. I speak as if I would instruct you. Now — methinks — you ask me: Who reads this? It is I, Sir, that read the tactics here to Hannibal and teach him to break rocks with *vinacre*. I am indeed somewhat pedantic in this but the liberty you are still pleased to allow me has carried me beyond my cue. It is trespass you know that's very ordinary with me and some junior colleagues. Not can I omit those verses which you have been sometimes pleased to apply to this forwardness of mine.

Such was the steed in Grecian poets famed,  
Proud Cyllarus, by Spartan Pollux tamed;  
Such courses bore to fight the god of Thrace  
And such Achilles, was thy warlike race.

It is my opinion, Sir, that truth cannot be urged with too much spirit, so that I have not sinned here as to the thing itself, for the danger's only in your person. I am afraid my boldness has been such I may be thought to fall short of that reverence which I owe you. This is indeed which I dare call a sin, and I am so far from it that it is my private

wonder how I came to think of it. Suffer me then to be impertinent for once and give me leave to repent of an humour which I am confident you place not among my faults but among your own indulgences.

Your humble servant  
S.N.  
From Heliopolis, 1651

### To the Present Readers

It will be questioned perhaps by the envious to what purpose these sheets are prostituted, and especially that drug wrapped in them — the Philosopher's Stone. To these it is answered by Solomon in *Ecclesiastes* III,5: "There is a time to cast away stones." And truly — I must confess — I cast away this Stone, for I misplace it. I contribute that to the fabric which the builders in all ages have refused. But less I seem to act *sine proposito*, I must tell you I do it not for this generation, for they are as far from fire as the author is from smoke. Understand me if you can, for I have told you an honest truth. I write books, as the old Roman planted trees, for the glory of God and the benefit of posterity. It is my design to make over my reputation to a better age, for in this I would not enjoy it, because I know not any from whom I would receive it. And here you see how ambitious I am grown; but if you judge the humour amiss tell me not of it, less I should laugh at you. I look indeed a step further than your lives, and if you think I may die before you I would have you know it is the way to go beyond you.

To be short — if you attempt this discourse, you do it without my advice, for it is not fitted to your fortunes. There is a white magic this book is enchanted withal: it is an adventure for *Knights of the Sun*, and the errants of this time may not finish it? I speak this to the university Quixotes, and to those only who are ill-disposed as well as undisciplined. There is among them a generation of wasps, things that will fight though never provoked. These buckle on their logic as proof, but it fares with them as with the famous Don: they mistake a basin for a helmet. For mine own part I am no reformer. I can well enough tolerate their positions, for they do not trouble mine. What I write is no rule for them, but is a legacy deferred to posterity; for the future times, wearied with the vanities of the present, will perhaps seek after the truth and gladly entertain it. Thus you will see what readers I have predestined for myself; but if any present Mastix fastens on this discourse I wish him not to traduce it, less I should whip him for it. This is advice, which if be well observed, it is possible I may communicate more of this nature. I may stand up like a Pharos in a dark night and hold out that lamp which Philalethes has overcast with that envious phrase of the Rabbis. "Ofttimes the silence of wisdom."

## AULA LUCIS

I have resolved with myself to discourse of Light, the powder of projection, and to deliver it over to the hands of posterity, a practice certainly very ancient and first used by those who were primordially wise. It was used then for charity, not for pomp, the designs of those authors having nothing in them of glory but much of benefit. It was not their intention to brag that they themselves did see but to lead those who in some sense were blind and did not see. To effect this they proceeded not as some modern

barbarians do — by clamorous, malicious disputes. A calm instruction was proposed and, that being once rejected, was never afterwards urged, so different and remote a path from the schoolroom did they walk in; and verily they might well do it, for their principles being once resisted they could not inflict a greater punishment on their adversaries than to conceal them. Had their doctrine been such as the universities profess now their silence indeed had been a virtue; but their positions were not mere noise and notion. They were most deep experimental secrets, and those of infinite use and benefit. Such a tradition then as theirs may wear the style of the noble Verulam and is most justly called a Tradition of the Lamp. But I observe that in their delivery of mysteries they have, as in all things else, imitated Nature, who dispenses not her light without her shadows. They have provided a veil for their art, not so much for obscurity as ornament: and yet I cannot deny that some of them have rather buried the truth than dressed it. For my own part, I shall observe a middle way, neither too obscure nor too open, but such as may serve posterity and add some splendor to the science itself.

And now, whosoever you are that in times to come shall cast your eyes on this book, if you are corrupted with the common philosophy, do not presently rage and take up the pen in defiance of what is here written. It may be you have studied these three questions *pro forma* and quick you are to dispute. But have you concocted the whole body of philosophy? Have you made Nature the only business of your life? And have you arrived at last to an infallible experimental knowledge? If none of these things, upon what foundation do you build? It is mere quackering to oppose the dead and such perhaps as your betters do not attempt in your own time of life. But as one said: that advantage breeds baseness. So some may insult because their adversary is out of the way, and tell me with that friendly stoic: "Dost you not hear this, Amphiatius, you who are hidden under the earth."

If any such tares spring above ground, when I am under it, I have already looked upon them as an idle, contemptible bundle. I have prepared them a convenient destiny and by my present scorn annihilated their future malice. It is a better and more serious generation I would service, a generation that seeks Nature in the simplicity thereof and follows her not only with the tongue but with the hand. If you are such then as this character speaks, let me advise you not to despair. Give me leave also to affirm to you, and that on my soul, that the consequences and treasures of this art are such and so great that your best and highest wishes fall short of them. Read then with diligence what I shall write, and to your diligence add patience, to your patience hope; for these are neither fables nor follies.

For thee old stores of fame and power I steal,  
And holy springs audaciously unseal.

I tell you a truth as ancient as the fundamentals of the world. Now, less my preface should exceed in relation to the discourse itself, which must be but short, I will quit this preliminary, that I may bring thee within doors; and here will I show you the throne of light and the crystalline court thereof.

Light originally had no other birth than manifestation, for it was not made but discovered. It is properly the life of everything, and it is that which acts in all particulars; but the communion thereof with First Matter was celebrated by a general contract before any particulars were made. The matter of itself was a passive thin substance but apt to retain light, as smoke is to retain flame. After impregnation it was condensed to a crystalline moisture, unctuous and fiery, of nature hermaphroditic, and this in a double sense, in relation to a double centre — celestial and terrestrial. From the terrestrial center proceeded the earthly Venus, which is fiery and masculine, and

the earthly Mercury, which is watery and feminine. These two are one against the other. From the celestial center proceeded two living images, namely, a white and a red light; and the white light settled in the water but the red went into the earth. Hence you may gather some infallible signs, whereby you may direct yourselves in the knowledge of the Matter and in the operation itself, when the Matter is known. For if you have the true sperm and know withal how to prepare it—which cannot be without our secret fire — you shall find that the matter no sooner feels the philosophical heat but the white light will lift himself above the water, and there will he swim in his glorious blue vestment like the heavens.

But that I may speak something more concerning the chaos itself, I must tell you it is not rainwater nor dew, but it is a subtle mineral moisture, a water so extremely thin and spiritual, with such a transcendent, incredible brightness, there is not in all Nature any liquor like unto itself. In plain terms, it is the middle substance of the wise men's Mercury, a water that is coagulable and which may be hardened by a proper heat into stones and metals. Hence it was that the philosophers called it their Stone, or if it be lawful for me to reveal that which the devil out of envy would not discover to Illardus, I say they called it a Stone, to the end that no man might know what it was they called so. For there is nothing in the world so remote from the complexion of a stone, for it is water and no stone. Now what water it is I have told you already, and for your better instruction I shall tell you more. It is a water made by Nature, not extracted by the hands of man. Nor is it mere water but a spermatic, viscous composition of water, earth, air and fire. All these four natures unite in one crystalline, coagulable mass, in the form or appearance of water; and therefore I told you it was a water made by Nature. But if you ask me how Nature may be said to make any such water, I shall instruct you by an example that's obvious. Earth and water are the only materials whereupon Nature works, for these two, being passive, are compassed about with the active superior bodies, namely, with the air, heaven, sun and stars. Thus do they stand in the very fire, at least under the beams and ejaculations thereof so that the earth is subject to a continual torrefaction and the water to a continual coction. Hence it comes to pass that we are perpetually overcast, with clouds, and this by a physical extraction or sublimation of water, which Nature herself distills and rains down upon the earth. Now this water, through of a different complexion from the philosopher's mineral water, yet has it many circumstances that well deserve our observation. I shall not insist long upon any: I will only give you one or two instances and then return to my subject. First of all then, you are to consider that Nature distills not beyond the body, as the chemist does in the recipient. She draws the water up from the earth, and to the same earth does she return it; and hence it is that she generates by circular and reasonable imbibitions. Secondly, you must observe that she prepares her moisture before she imbibes the body therewith, and that by a most admirable preparation. Her method in this point is very obvious and open to all the world, so that if men were not blind I would not need to speak of it. Her water — we see — she rarefies into clouds, and by this means does she rack and tenter-stretch the body, so that all the parts thereof are exposed to a searching, spiritual purgatory of wind and fire. For her wind passes quite through the clouds and cleanses them; and when they are well cleansed then comes Nature in with her fire and fixes it in *ente jure sapphirico*.

But this is not all. There are other circumstances, which Nature uses above ground in order to fecundate her vegetables. And now I would speak of her subterranean preparations, in order to mother her minerals: but that it is not lawful for me, as it was for the poet — "To discover things hidden in deep earth and fire." However, I shall not fail to tell you a considerable truth, whosoever you are that studies this difficult

science. The preparation of our animal and mineral sperm- -I speak of the true preparation — is a secret upon which God has laid His seal, and you will not find it in books, for it was never entirely written. Your best course is to consider the way of Nature, for there it may be found, but not without reiterated, deep and searching meditations. If this attempt fails, you must pray for it, not that I hold it an easy or a common thing to attain to revelations, for we have none in England; but God may discover it to you by some ordinary and natural means. In a word, if you can not attain to it in this life, yet shall you know it in your own body, when you are past knowing of it in this subject. But because I will not deprive you of help which I may lawfully communicate, I tell you that our preparation is a purgation. Yet do not we purge by common and ridiculous sublimate or the more foolish filtrations, but by a secret, tangible, natural fire. He that knows this fire, and how to wash with it, knows the key of our Art, even our hidden Saturn, and the stupendous, infernal lavatory of Nature. Much more could I say concerning this fire and the proprieties thereof, it being one of the highest mysteries of the creation, a subject without question wherein I might be voluminous, and all the way mysterious, for it relates to the greatest effects of magic, being the first male of the Mercury and almost his mother. Consider then the generation of our Mercury and how he is made, for here lies the ground of all our secrets. It is plain that outwardly we see nothing but what is gross — for example, earth, water, metals, stones and, among the better creatures, man himself. All these things have a lumpish, ineffectual exterior, but inwardly they are full of a subtle, vital luminosity, impregnated with fire. This vitality Nature makes use of in generations, wherefore we call it the sperm. For instance, we know the body of man is not his sperm, but the sperm is a subtle extraction taken out of his body. Even so in the great world, the body or fabric itself is not the seed. It is not earth, air, fire or water; for these four — if they were put together — would be still four bodies of different forms and complexions. The seed then, or first matter, is a certain vitality extracted from these four, for each of them contributes from its every center a thin, slimy substance; and of their several slimes Nature makes the sperm by an ineffable union and mixture. This mixture and composition of slimy principles is that mass which we call the first matter. It is the minera of man, whereof God made him: in a double image did He make him in the day that he became a living soul. Hence a famous artist, speaking of the creation of Adam and alluding to the first matter, delivers himself in these terms: "From the limosity of the elements did God create Adam, namely, from the limosity of earth, water, air and fire; and He gave unto him life from the Sun of the Holy Spirit, and from light, clarity and the light of the world." Have a care then that you mistake not any specified body for the sperm. Beware of quicksilver, antimony and all the metals — have nothing to do with ought that is extracted from metals. Beware of salts, vitriols and every minor mineral. Beware of animals and vegetables, and of everything that is particular, or takes place in the *classis* of any known species. The first matter is a miraculous substance, one of which you may affirm contraries without inconvenience. It is very weak and yet most strong. It is excessively soft and yet there is nothing so hard. It is one and all, spirit and body, fixed and volatile, male and female, visible and invisible, burns and burns not. It is water and wets not; it is earth that runs and air that stands still. In a word, it is Mercury, the laughter of fools and the wonder of the wise, nor has God made anything that is like him. He is born in the world, but was extant before the world. Hence that excellent riddle which he has somewhere proposed of himself: "I dwell" — saith he— "in the mountains and in the plains, a father before I was a son. I generated my mother, and my mother, carrying me in her womb, generated me, having no use for a nurse."

This is that substance which at present is the child of the sun and moon; but originally both his parents came out of his belly. He is placed between two fires, and therefore is ever restless. He grows out of the earth as all vegetables do, and in the darkest night that is receives a light from the stars, and retains it. He is attractive at the first because of his horrible emptiness, and what he draws down is a prisoner forever. He has in him a thick fire, by which he captivates the thin and he is both artist and matter to himself. In his first appearance he is neither earth nor water, neither solid nor fluid, but a substance without all form but what is universal. He is visible but of no certain color, for chameleon-like puts on all colors. Nothing in the world has the same figure as him. When he is purged from his accidents, he is a water colored with fire, deep to the sight and — as it were — swollen; and he has something in him that resembles a commotion. In a vaporous heat he opens his belly and discovers an azure heaven he hides a little sun, a most powerful red fire, sparkling like a carbuncle, which is the red gold of the wise men. These are the treasures of our sealed fountain, and though many desire them yet none enters here but he that knows the key, and withal how to use it. In the bottom of this well lies an old dragon, stretched long and fast asleep. Awake her if you can, and make her drink; for by this means she will recover her youth and be serviceable to you forever. In a word, separate the eagle from the green lion; then clip his wings, and you have performed a miracle. But these, you will say, are blind terms, and no man knows what to make of them. True indeed, but they are such as are received from the philosophers. Howsoever, that I may deal plainly with you, the eagle is the water, for it is volatile and flies up in clouds, as an eagle does; but I speak not of any common water whatsoever. The green lion is the body, or magical earth, with which you must clip the wings of the eagle; that is to say, you must fix her, so that she may fly no more. By this we understand the opening and shutting of the chaos, and that cannot be done without our proper key- -I mean our secret fire, wherein consists the whole mystery of the preparation. Our fire then is a natural fire; it is vaporous, subtle and piercing. It is that which works all in all, if we look on physical digestion; nor is there an thing in the world that answers to the stomach and performs the effects thereof but this one thing. It is a substance of propriety solar and therefore sulphurous. It is prepared, as the philosophers tell us, from the old dragon and in plain terms it is the fume of Mercury—not crude, but cocted. This fume utterly destroys the first form of gold, introducing a second and more noble one. By Mercury I understand not quicksilver but Saturn philosophical, which devours the Moon and keeps her always in his belly. By gold I mean our spermatic, green gold — not the adored lump, which is dead and ineffectual. It would be well for the students of this noble Art if they resolved on some general positions before they attempted the books of the philosophers. For example, let them take along with them these few truths, and they will serve them for so many rules whereby they may censure and examine their authors. First, that the first matter of the Stone is the very same with the first matter of all things; secondly, that in this matter all the essential principles or ingredients of the Elixir are already shut up by Nature, and that we must not presume to add anything to this matter but what we have formerly drawn out of it; for the Stone excludes all extractions but what is distilled immediately from its own crystalline, universal minera; thirdly and lastly, that the philosophers have their peculiar secret metals, quite different from the metals of the vulgar, for where they name Mercury they mind not quicksilver, where Saturn not lead, where Venus and Mars not copper and iron, and where Sol or Luna not gold or silver. This Stone verily is not made of common gold and silver, but it is made, as one delivers it, "of gold and silver that are reputed base, that stink and withal smell sweetly; of green, living gold and silver to be found

everywhere but known to very few." Away then with those mountebanks who tell you of antimony, salts, vitriols, marcasites, or any mineral whatsoever. Away also with such authors as prescribe or practice upon any of these bodies. You may be sure they were mere cheats and wrote only to gain a reputation of knowledge. There are indeed some uncharitable but knowing Christians who stick not to lead the blind out of his way. These are full of elaborate, studied deceits, and one of them who pretends to the Spirit of God has at the same mouth vented a slippery spirit, namely, that the Stone cannot be opened through all the grounds — as he calls them — under seven years. Truly I am of the opinion that he never knew the Stone in this natural world; but how well acquainted he was with the tinctures in the spiritual world I will not determine. I must confess many brave and sublime truths have fallen from his pen; but when he descends from his inspirations and stoops to a physical practice, he is quite beside the butt.

I have ever admired the royal Gerber, whose religion — if you question — I can produce it is these few words: "The sublime, blessed and glorious God of natures." This is the title and the style he always bestows upon God, and it is enough to prove him no atheist. He, I say, has so freely and in truth so plainly discussed this secret that had he not mixed his many impertinences with it he had directly prostituted the mysteries. What I speak is apparent to all knowing artists, and hence it is that most masters have so honored this Arabian that in their books he is commonly called *Magister Magistrorum*. We are indeed more beholden to this prince — who did not know Christ — than to many professed Christians, for they have not only concealed the truth but they have published falsities and mere inconsistencies therewith. They have studiously and of mere purpose deceived the world, without any respect of their credit or conscience. It is a great question who was most envious, the devil in his *Recipe* to our Oxford doctor of Arnoldus in his *Accipe* to the King of Aragon. I know well enough what that gentleman *de Villa Nova* prescribes, and I know withal his instructions are so difficult that Count Trevor, when he was adept *suo modo*, could not understand them, For he has written most egregious nonsense, and this by endeavoring to confute greater mysteries than he did apprehend. Now, if any man thinks me too bold for censuring so great an artist as Arnoldus was, I am not so empty but I can reason for myself. I charge him not with want of knowledge but what of charity — a point wherein even the possessors of the Philosopher's Stone are commonly poor. I speak this because I pity the distractions of our modern alchemists, though Philalethes laughs in his sleeve and, like a young colt, kicks at that name. For my own part I advise no man to attempt this Art without a master, for though you know the Matter yet are you far short of the Medicine. This is a truth you may be confident of, and if you will not believe my text, take it upon Raymund Lully's experience. He knew the Matter, it being the first thing his master taught him. Then he practiced upon it, in his own phrase, after many and multifarious roads, but all to no purpose. He had the Cabinet but not the Key. At last he found himself to be — what many doctors are — a confident quack, a broiler and nothing more — as it appears by his subsequent confession. "The Masters assure us in their goodness that the Great Work is one of solution and congelation, the same being performed by the circulatory way; but though ignorance hereupon many who were sound in scholarship have been deceived regarding the mastery. In their excess of confidence they assumed themselves to be proficient in the form and mode of circulation, and it is not our intent to conceal that we ourselves were of those who were stricken in this respect. With such presumption and temerity we took our understanding of this science for granted, yet we grasped it in no wise, till we came to be taught of the spirit by the mediation of

Master Arnold de Villa Nova, who effectually imparted it unto us out of his great bounty."

Thus he; and now I shall advise the chemist to set a watch at his lips because of some invisible gentlemen that overhear. I myself have known some men to affirm they had seen and done such things which God and Nature cannot do, according to the present laws of creation. But had my young friend Eugenius Philalethes been present he would have laughed without mercy. Take heed then what you say, less you make sport for the wise, for they are something like the immortals:

"Laughter unquenchable arose among the blessed gods."

Many men there are who think it ordinary to be instructed in these secrets, but in this they are confidently mistaken. He must be a known, true friend, a friend of years, not of days; not a complemental thing, whose action is all hypocrite; not a severe dissembler, who gives you fair words but — if once tried — his heart is so far from his promises that, like a fly in a box, is scarce a part of his body. Raymund Lully has in a certain place delivered himself handsomely in relation to the practice, and this for his friend's sake. But how rigid then was he *in scriptis*. His disciple — if he could understand him — was to be accountable to him in the use of the mystery; and therefore he tells him plainly that he did it "by way of load only, looking for restitution at the judgment day." We must not expect then to be instructed because we are acquainted, and verily acquaintance with such persons is a thing not common. In ordinary favors it is supposed that men should deserve them before they receive them; but in this thing — which is a benefit incomparable — it falls out otherwise. We look for present discoveries; we believe the philosophers will teach us and in plain terms tell us all their Art; but we know not wherefore they should be so kind to us. Such impudent hopes have no more reason in them than if I should spend a compliment on a rich gentleman and then expect he should make me his heir in lieu of my phrase, and so pass his estate upon me. This is very absurd, but nothing more common; though I know there is another sort of well-wishers, but they are most miserable, for they cast about to fool those men whom they know to be wiser than themselves. But in this point the philosophers need no instructions. They can act many parts, and he that plots to over-reach them takes a course to break before he sets up. It remains then that we bestow our attempts on their books, and here we must consider the two universal natures, light and matter.

Matter — as I have formerly intimated — is the house of light. Here he dwells and builds for himself, and, to speak truth, he takes up his lodging in sight of all the world? When he first enters it, it is glorious, transparent room, a crystal castle, and he lives like a familiar in diamonds. He has then the liberty to look out at the windows; his love is all in his sight: I mean that liquid Venus which lures him in; but this continues not very long? He is busy — as all lovers are—and labors for a closer union, insinuates and conveys himself into the very substance of his love, so that his heat and action stir up her moist essences, by whose means he becomes an absolute prisoner. For at last the earth grows over him out of the water, so that he is quite shut up in darkness; and this is the secret of the eternal God, which He has been pleased to reveal to some of His servants, though mortal man was never worthy of it? I wish it were lawful for me to enlarge myself in this point for religion's sake, but it is not safe for convenient that all ears should hear even the mysteries of religion. This leprous earth — for such it is, if it be not purged — is the toad that eats up the eagle, or spirit, of which there is frequent mention in the philosopher's books. In this earth also have many of the wise men seated that tincture which we commonly call darkness. Truly they may as well bestow it on the water or the air, for it appears not in any one

element but either in all four or else in two, and this last was that which deceived them. Now, the water has no blackness at all but a majestic, large clarity. The earth likewise, in her own nature, is a glorious crystallized body, bright as the heavens. The air also excels both these in complexion, for he has in him a most strange, inexpressible whiteness and serenity. As for the fire it is outwardly red and shining — like a jacinth — but inwardly in the spirit white as milk.

Now, if we put all these substances together, through purged and celified, yet when they stir and work for generation the black color overspreads them all — and such a black — so deep and horrid — that no common darkness can be compared to it. I desire to know then how this tincture arises, for the root of every other color is known. It is to be observed that in the separation of the elements this blackness appears nowhere but in that element which is under the fire; and this only while you are drawing out the fire — for the fire being separated the body is white. It is plain then that darkness belongs to the fire, for in truth fire is the manual of it; and this is one of the greatest mysteries, both in Divinity and philosophy. But those that would rightly understand it should first learn the difference between fire and light.

Trismegistus, in his vision of the creation, did first see a pleasing, gladsome light, but interminated. Afterwards appeared a horrible sad darkness, and this moved downwards, descending from the eye of the light, as if a cloud should come from the sun. This darkness — saith he — was condensed into a certain water, but not without a mournful, inexpressible voice or sound, as the vapors of the elements are resolved by thunder. After this — saith that great philosopher — the Holy Word came out of the light and did get upon the water, and out of the water He made all things. Let it be your study then — who would know all things — to seek out this secret water, which hath in itself all things. This is the physical and famous Pythagorean cube, which surprises all forms, and holds them prisoners. "If anywise," said my Capnion, "a form implanted in this ground remain thereon; if it enters therein and does abide in such solid receptacle, being laid up therein as in a material foundation; it is not received at random nor indifferently but permanently and specially, becoming inseparable and incommunicable, as something added to the soil, made subject to time and to place, and deprived — so to speak of its liberty in the bondage of matter."

The consequences of this prison, which sometimes are sad, and the steps that lead to it, are most elegantly expressed in the oracles. "A steep descent extends beneath the earth, leading seven ways by stages and beneath which is the throne of a horrible necessity."

In a word, all things in the world — as well events as substances — flow out of this well. Hence come our fortunes and our misfortunes, our riches and our poverty, and this according to the scales of the Supreme Agent, in his dispensations of light and darkness. We see there is a certain face of light in all those things which are very dear or very precious to us. For example, in beauty, gold, silver, pearls, and in everything that is pleasant or carries with it any opinion of happiness — in all such things I say there is inherent a certain secret, concomitant lustre, and while they last the possessors also are subject to a clearness and serenity of mind. On the contrary, in all adversity there is a certain corroding, heavy sadness, for the spirit grieves because he is eclipsed and overcast with darkness. We know well enough that poverty is but obscurity, and certainly in all disasters there is a kind of cloud or something that answers to it. In people that are very unfortunate this darkness has a character, and especially in the forehead there lies a notable judgment; but there are few who can read in such books. Of this Vergil — who was a great poet but a greater philosopher — was not ignorant,

for describing Marcellus in the Elysian fields he makes his sad countenance an argument of his short life.

Aeneas here beheld, of form divine:  
A godlike youth in glittering armor shine,  
With great Marcellus keeping equal pace:  
But gloomy were his eyes, dejected was his face.  
He saw, and wondering ask'd his airy guide  
What and of whence was he who pressed the hero's side;  
His son: or one of his illustrious name;  
How like the former and almost the same.  
Observe the crowd that compass him around:  
All gaze and all admire, and raise a shouting sound.  
But hovering mists around his brows are spread  
And night with sable shades involves his head.

But these are things that ought not to be publicly discussed, and therefore I shall omit them. He that desires to be happy let him look after light, for it is the cause of happiness, both temporal and eternal. In the house thereof it may be found, and the house is not far off nor hard to find, for the light walks in before us and is the guide to his own habitation. It is the light that forms the gold and the ruby, the adamant and the silver, and he is the artist that shapes all things. He that has him has the mint of Nature and a treasure altogether inexhaustible. He is blessed with the elect substance of heaven and earth, and in the opinion of the *Turba* "deserves to be called blessed and is raised above the circle of the earth." Nor indeed without reason, for Nature herself dictates to us and tells us that our happiness consists in light. Hence it is that we naturally love the light and rejoice in it, as a thing agreeable and beneficial to us. On the contrary, we fear the darkness and are surprised in it with a certain horror and a timorous expectation of some hurt that may befall us. It is light then that we must look after, but of itself it is so thin and spiritual we cannot lay hands upon it and make it our possession. We cannot confine it to any one place, that it may no more rise and set with the sun. We cannot shut it up in a cabinet, that we may use it when we please, and in the dark night see a glorious illustration. We must look then for the mansion of light — that oily, ethereal substance that retains it — for by this means we may circumscribe and confine it. We may impart and communicate it to what bodies we please, give the basest things a most precious lustre and a complexion as lasting as the sun. This is that mystery which the philosophers have delivered hereunto in most envious and obscure terms; and though I do not arrogate to myself a greater knowledge than some of them had, yet I do affirm— and that knowingly — that this secret was never communicated to the world in a discourse so plain and positive as this is. It is true this script is short, and the body of magic has no proportion to these few lines. To write of it at large and discover its three scenes — elemental, celestial and spiritual — was sometimes the design of one that was able to perform? But he — and it was every the fortune of truth to be so served — was not only opposed but abused by a barbarous, malicious ignorant one. I should think that gentleman did set up for Bartholomew Fair — he has such contrivances in his *Second Lash*. The tutor dedicates to his pupil, and the same pupil versifies in commendation of his tutor? Here was a claw; there was never any so reciprocal: surely Rosinante and Dapple might learn of these two. But this is stuff to stop our noses at: let us leave it for Cambridge, whence it first came.

The coagulation of our water and the solution of our earth are the two greatest and most difficult operations of the Art, for these two are contrary keys: the water opens

and the earth shuts. Be sure then to add nothing to the subject but what is of its own nature, for when it is prepared it is all-sufficient. He coagulates himself and dissolves himself, and passes all the color — and this by virtue of its own inward sulphur or fire, which wants nothing but excitation, or, to speak plainly, a simple, natural coction. Everybody knows how to boil water in fire; but if they knew how to boil fire in water their physic would reach beyond the kitchen. Study then and despair not; but study no curiosities. It is a plain, straight path that Nature walks in; and I call God to witness that I write not this to amaze men; but I write that which I know to be certainly true.

This is all I think fit to communicate at this time, neither had this fallen from me but that it was a command imposed by my superiors. They that desire experimental knowledge may study it as a sure guide; but he that rests at his lips and puts not his philosophy into his hands needs not these instructions. *Wit's Commonwealth* or a *Book of Apothegms* may serve his turn. I prescribe not here for any but such as look after these principles; and they must give me leave to inform them, if they be not perfect masters of the art. I am one that gives and takes, and this to avoid contentions. I can suffer the schoolman to follow his own placets, so long as he does not hinder me to follow mine. In a word, I can tolerate men's errors and pity them. I can propound the truth, and if it be not followed, it is satisfaction to me that what I did was well done.

### A Postscript to the Reader

This small discourse was no sooner finished — though by command — but the same authorities recalled their commission; and now being somewhat transformed I must — as some mysteriously have done — live a tree. Yet the wise know that groves have their wood nymphs, and I remember I have read of an image whose *Hic fodias* placed the substance in the shadow. To be plain, I am silenced, and though it be in my power to speak, yet I have laws as to this subject which I must not transgress. I have chosen therefore to oppose my present freedom to my future necessity, and to speak something at this time which I must never publicly speak hereafter. There is no defect in ought that I have written, if I but tell you one thing which the philosophers have omitted. It is that which some authors have called "the Vessel of Nature and the Green Vessel of Saturn"; and Miriam calls it the Vessel of Hermes. A menstrous substance it is; and — to speak the very truth — it is the matrix of Nature, wherein you must place the universal sperm as soon as it appears beyond its body. The heat of this matrix is sulphurous, and it is that which coagulates the sperm; but common fire — though it be most exactly regulated — will never do it; and in this opinion see that you be not deceived. This matrix is the life of the sperm, for it preserves and thickens it; but beyond the matrix it takes cold and dies, and nothing effectual can be generated thereof. In a word, without this matrix you will never coagulate the matter nor bring it to a mineral complexion. And herein also there is a certain measure to be observed, without which you will miscarry in the practice. Of this natural vessel speaks Miriam in the following words: "The key of the science is in all bodies, but owing to the shortness of life and the length of the work the Stoics concealed this one only thing. They discovered tinging elements, leaving instructions thereon, and these also the philosophers continue to teach, save only concerning the Vessel of Hermes, because the same is Divine, a thing hidden from the Gentiles by the wisdom of God; and those who are ignorant of it know not the regimen of truth for want of the Hermetic Vessel." In the proportion and regimen of this thing which they call their vessel, and

sometimes their fire, consists all the secret. And verily the performances thereof are so admirable and so speedy they are almost incredible. Had I known this at first it had not been with me as it has been; but every event has its time, and so had I. This one thing — to lay aside other reasons — does not only persuade but convince me that this Art was originally revealed to man. For this I am sure of — that man of himself could not possibly think of it; for it is invisible. It is removed from the eye, and this out of a certain reverence; and if by chance it comes into sight it withdraws again naturally. For it is the secret of Nature, even that which the philosophers call "the first copulation." This is enough to a wise artist; at least it is all I intend to publish. And now, reader, farewell.

# **Book of the Chemical Art**

by

**Marsilius Ficinus**

*"An unknown concerning the Chymicall Art. But Lucerna Salis affirms him to be Marcilius Ficinus, an Italian of the Dukedome of Florence or Tuscany, in the year 1518."*

## **Chapter 1.**

### **Of the Generation of Metals in the Bowels of the Earth.**

The opinion and determination of all who philosophize rightly is the same: that all metals are generated by the vapour of sulphur, and of argent vive. Because when the fat of the earth being heated, finds the substance of water somewhat globulous, it as well by its natural virtue, as by the rays of the celestial bodies and the endeavor of heaven, as according to the purity or impurity of each, consolidated it in the veins of the earth into those most beautiful bodies, gold, silver, copper, tin, iron, and lead.

## **Chapter 2.**

### **Of Nature & Art**

But there are in the arch of this world, two efficient causes, Nature and art. Nature daily produces and generates new things. But art by conception, making an impression of the similitudes of those things upon herself, does in an admirable manner prosecute the footsteps and delineations of Nature. So that if the wit of man do not sometime assist in some things, it is evident that Nature herself had gone astray from her operation. Or art sometimes does by the help of Nature, correct, supply and in a manner (especially in this magnificent discourse of mineral things) seems to exceed Nature. Which has already been long since consecrated to perpetual memory by those ancient Philosophers.

There are two sorts of Philosophers. Some only searching into Nature by herself, have in the monuments of their writings delivered the virtue and power which sublunary things have, as well from the elemental qualities, as from heaven and the stars; as the physicians are. And some others who have described the natures of animals, trees, herbs, metals, and precious stones. But others truly are more glorious, penetrating most sagaciously and sharply not only into Nature, but finally into the arcanum itself of Nature, and into her more inward recesses, have by a truer title assumed to themselves the name of philosopher. But because Nature produces all metals out of two things sulphur and Mercury, and has left us the superior bodies generated out of them, with the inferior bodies, certain is it is that the industrious may make the same out of her three operations, and reduce the inferior bodies to the Nature and perfection of the superior bodies.

## **Chapter 3.**

**Refutes an opinion of some in this art, and the philosophical art is laid down in a very few words.**

And because by most of the studious in philosophy it is granted that metals themselves are generated of sulphur and Mercury, some have judged that sulphur and Mercury, since they are the root and matter of metals, ought to be taken and so long decocted, until they were conglutinated together into a metallic body. These truly had they descended deeper into nature's sanctuary, would never have come to such foolish opinions. For though sulphur and Mercury were as it were the root of metals before the first coagulation, yet now they are not, since they are brought to another nature: whence it remains that there cannot be made out of them any metallic body. Since also the chain is unknown, by which Venus and Mercury copulated together in due proportion. Wherefore they are not to be taken, but rather that which is out of them fully decocted in the womb of the earth, and that truly the most pure; whose like you will not find in a vegetable nature.

It is evident that all little trees, flowers and small herbs are produced from water and the union of a subtle earth. And if you endeavor to produce a tree or an herb, you must not take earth or water, but rather that which is from them, as a scion or a seed, which being committed to the bosom of the earth, the parent of all things, and cherished with a nutriment of their own nature, and called forth by the darting of the solar light, do in due time break out into the superficies of the earth, into the species of a tree or an herb. In like manner that divine art teaches how to take the seed out of the more perfect body; which being put into the philosophical earth prepared by art and continually decocted by a temperate heat into a white or red powder, is said to have converted the inferior bodies into the nature of the superior.

#### **Chapter 4.**

**Delivers why the Philosophers have sought for this Art, not moved them to it, and this Question is resolved: why the Spirit in Metals cannot Propagate its like, since the Spirit of everything is the Author of Generation.**

But we readily affirm that the inspiration of God was the chief cause why those ancient philosophers searched after this science. For the philosophers seeing that all vegetable and animal things, as also other things, do by a certain spirit of their own multiply themselves, and that a transmutation is in this inferior world made by the air, which seemed in a long time to corrupt all particular things, and that their nature changed itself by the motions of another thing: There arose among them this question: namely why the spirit in metals could not propagate its like, since out of one scion there grew many, and out of one little grain almost innumerable grains did multiply themselves. It was at length decreed by the divine oracle, that the spirit was withheld by a grosser matter, which spirit if it were separated by a certain sublimation at the fires and being separated were preserved in its own connatural seat, it might as a seminal virtue, without any untruth, generate its like. From hence the philosophers thought to bring the light and lustre of the most perfect body into the inferior bodies since they had found that they differed among themselves only according to the decoction, either greater or less, and the mercury was the first original of all metals, with which mercury extracting the metallic part of gold, they brought gold to the first nature. Which reduction indeed since it is easy and possible, it was by the philosophers concluded that a transmutation in metals is easy and possible. And when these primitive philosophers had reduced gold into the first matter, they made use of the celestial influence, that it might not be made a metal again such as it was before. Afterward they

purified its nature, separating the unclean from the clean. Which being done they called that thing, the transmuting stone of the philosophers. For the making whereof several operations have been invented by several philosophers, that that might be completed by art which was left by Nature; since Nature herself is always inclined toward her own perfection.

## **Chapter 5.**

### **Treats of What the Philosophers' Stone is, and Discourses first of its First Part.**

And because the philosophers had so obscurely set forth this science in strange involvings of words and shadows of figures, the stone of the philosophers was doubted by a very many men. Which it is of what things made? But if you will mind diligently, we divide the stone into two parts. The first part we say is terrestrial Sol, wherein both the ancient philosophers and the more modern do plainly agree with me in their testimonies in the Turba. Without terrestrial Sol the physical work is not perfected. Since they all assert that there is no true tincture without their *Æs* brass because in that there is the most pure sulphur of the wise, in which sage Nature contains her seed. And as the sun diffuses and darts down most lively and penetrating rays on this elementary world: So the stone of the philosophers being by a physical operation made out of gold, the son, as I may say, of the sun, disperses itself into other metals, and will forever equalize them to himself in virtue, color, and weight. And because all metals, we deservedly take gold before others. For since we would make gold and silver, it is necessary to take the same. Man is generated out of man, a tree from a tree, and herb produces an herb, and a lion a lion; since each thing according to the temper of its nature, which they call the completion, generates and produces its like. Yet the philosophers more truly do not make gold or silver, but Nature cleansed by the skill of the operator.

## **Chapter 6.**

### **Treats of the Second Part of the Stone, Where the Spirit is Compared to the most Glorious Virgin Saint Mary.**

We say the mercury vive is the second part of the stone. Which since it is living and crude, is said to dissolve the bodies themselves, because it naturally adheres to them in their profundity. This is the stone without which Nature operates nothing. Whence the philosophers advise us not to work but in Sol and mercury; which being joined make up the stone of the philosophers. Who therefore can deservedly praise the merits of mercury, since it is he alone who maketh gold thin and who has so great a power, that he can reduce Sol itself into the first nature? Which power nothing else in the world is discerned to have. It is thus said of the mercury which the wise men seek for, is in mercury. Mercury destroys all foliated Sol: it dissolves and softens it, and takes the soul out of the body. If it be sublimated, then there is made aqua vitae. If any one therefore ask you: What are the stones? You shall answer, that Sol and mercury are the physical stones. But these stones are dead on Earth and operate nothing, but what is by the industry of men supplied to them.

I will propose you a similitude of gold. The ethereal heaven was shut from all men, so that all men should descend to the infernal seats, and be there perpetually detained. But Jesus Christ opened the gate of the ethereal Olympus, and has now unlocked the kingdoms of Pluto, that the souls may be taken out; when by

the co-operation of the holy spirit in the virginal womb, the virgin Mary did by an ineffable mystery and most profound sacraments conceive what was the most excellent in the heavens and on the earth; and at length brought forth for us the saviour of the whole world, who out of his super abundant bounty shall save all who are able to sin, if the sinner turn himself to him. But she remained an untouched and undefiled virgin: whence mercury is not undeservedly compared to the most glorious saint the virgin Mary. For mercury is a virgin because it never propagated in the womb of the Earth and metallic body, and yet it generates the stone for us; by dissolving heaven, that is, gold, it opens it, and brings out the soul; which understand you to be the divinity, and carries it some little while in its womb, and at length in its own time transmits it into a cleansed body. From whence a child, that is, the stone, is born to us, by whose blood the inferior bodies being tinged are brought safe into the golden heaven, and mercury remains a virgin without a stain, such as is was ever before.

### **Chapter 7.**

**Determines why the Philosophers have hidden this Knowledge: where the Praise of the Art is set down, and He Inveighs against Zoilus the Carper as the Philosophers.**

But Hamul in Senior declares the chief cause why the philosophers have delivered this art down to posterity and the sons of wisdom, by uncertain similitudes and obscure allegories: that they might attribute it to the glorious God who might reveal it to whom he would, and prohibit it from whom he would. Rasis also in the book, 'The Light of Lights', reports: For if I should explain all things according to what they are, there would be no further occasion of prudence, but the fool would be made equal to the wise man. We read also in the end of the Turba: For unless the names were multiplied in this physical art, children would deride our knowledge. Wherefore we do not much value those who cavill at our divine art as adulterate; from which the most famous philosophers used to take all the knowledge of almost all things; as heretofore the statuaries did the thefts and the threads of our art, from the statue of Polycletus. It would also be most absurd to suspect that those ancient philosophers of venerable authority, especially in this discourse of natural things, have delivered down anything of falsehood to posterity, who employed their chiefest labour in inquiring after truth, although they ascended not to the sublimeness of the saving nature of faith, and the greatest height of the divine essence. Who therefore, but Zoilus, would not praise this science, and particularly favor it? From whence almost all the arts of these detractors are taken: from which so many colors very useful for the art of picture drawing derive their beginning, I say nothing of the art of money making: I pass by the learned distillation of the physicians, whereby they use to draw out the virtue, which they call a Quintessence. Which shall I say of those brazen vessels wherewith we make lightening and thunder among men? If they did but use them only against the sacrilegious enemies of the christian faith.

Besides the science of the stone is so sublime and magnificent, that therein almost all Nature and the whole universe of beings is beheld, as in a certain clear looking glass. For it is like a lesser world, where there are the four elements, and a fifth essence, which they call heaven in which another most noble essence has placed its seat, which some philosophers have used to compare (with reverence be it spoken) to the omnipotent God, and the most holy and undivided Trinity. Which is neither of the nature of the heaven, nor of the natures of the elements: and they have called it by a particular name, the soul, the middle nature. And as God the maker of the world: so this essence, which is called by the title of a God, is everywhere in the whole world, it is, in the physical glass. And as the omnipotent God is immense in the procreation of its like, even to the last end of the greater world. For then the generative nature shall be taken away from every

procreating thing. From which words one skillful in Nature may gather, that the stone can tinge many parts; whereby also many other difficulties may be removed. Then out upon Aristarchus who blushes not to profess himself an interpreter of the divine writings, and yet feareth not with his most impudent railing to attack this knowledge of a Nature created by God; than which, next after the sacred writings, God has conferred on this world nothing more magnificent and more sublime.

Tell me by the immortal God, what is more unjust than for men to hate what they are ignorant of? And then if the thing do deserve hatred, what is of all things more shallow? What more abject? Or what greater madness and potage is there, than to condemn that science in which you have concerned yourself just nothing at? Who hast never learned either Nature or the majesty of Nature, or the property or the occult operations of metals. The councellour also babbles and crokes, and the pettyfoggers of the law, the greatest haters of philosophy, who with the hammer of a venal tongue coin themselves money out of the tears of the miserable: who shipping over the most sacred of laws, have by the intricacies of their expositions persecuted all the world with their frauds. But why do I go after jeers and satyrs? Let these crabbed fellows and their followers remain perpetually in their opinion, who know nothing. Which is honest, which is pleasant, which is delightful, which lastly is anything elevated above a vulgar doctrine: and who have attained at nothing glorious and famous, but perhaps at some plebian business from the black sons of Cadamus. But to which purpose are these? I have made the choice of this stone of the philosophers familiar to me; and I very often call it the only Minerva, and the greatest pearl of all occult philosophy, or of magic, not indeed of the superstitious, but of the natural. Yet it seems in the opinion of the unlearned to degenerate far from a better study: which is decreed and ordained by the divine will.

## Chapter 8

**Treats of the first Essence of all things: and it is here discussed what Nature is, what the soul the middle nature, what the soul of the world, where that very great error is confuted of philosophers asserting the world to be an animal, and it is disputed that there is only a human soul; by a participation or likeness of which, there seems to be a brutal soul. And that the sun is the eye of the world and the heart of heaven.**

I have now a mind, candid reader, to procure you something concerning the secrets of Nature, both out of philosophical, and the theological magazine. Since I have perceived that many of the ancients as also of the more modern have taken great pains in searching after Nature, nobody but one beside himself will deny that those things will be of use to the whole academy and exercise of philosophy. But here the cradle of Nature is to be looked for a higher, do not therefore think it pious, if I make a digression a little further than perhaps this undertaking may require.

The most glorious God, the contriver, and the ineffable author of all things, before the beginning of the world, wanting nothing, but all-sufficient to himself, and forever remaining in the most profound retirement of his divinity, being out of his most abundant beauty willing, that the things from all eternity foreknown should proceed into existence, created in the beginning a certain essence of them, in rough draughts, as I may say, as yet unformed, which Moses, he whom I am to stile the fountain and chief president of the philosophy of the philosophers, does sometimes call a void and empty earth, sometimes an abyss and water, but Anaxagoras a confused chaos. Others have rightly termed it, the mother of the world, the foundation

and the face of Nature. Within whose womb when all things lay undistinguished and undigested, nor more conspicuous in their proper forms, the artificial creator, did by the intervening spirit of God exactly and regularly drawn and describe this visible world, according to copy and the similitude of the intelligible world. Hence he with shining fires most workman-like adorned the heavens hung up on high, and so ordered and digested the motion of them, and of the stars, that they should in a wonderful manner run about the arch of heaven, for the formation of the varieties of the seasons succeeding one another; and that by their motion and light they might warm, cherish and preserve in their beings the inferior things. Therefore he laid the inferior things beneath the superior, as an egg to be hatched under a hen, or as a woman to be made fruitful by a man. Into which he from the beginning inserted certain seminal reasons, that they might, taking their opportunities, multiply themselves, as I may say, with a perpetual fertility and offspring. But God wrought out his compacted being of the world by certain harmony and musical proportion alleyed to one another, that which are in the superior world are in the inferior also, but in a terrestrial manner: that which likeness are in the inferiors, may also be seen in the superious, in a celestial manner indeed, and according to the cause.

To which you may perhaps apply the opinion of Anaxagoras, holding that everything is in everything. Wherefore it is agreeable that God should rule and fill up all which he created. Nor do we therefore say that God does fill up all things, that they should contain him, but that they rather should be contained by him. Neither is it to be thought that God is in all things so that each thing according to the proportion of its bigness may contain him, that is the greater things the more, and the lesser the less. But God so filleth up all things that there is not anything where he is not. And we therefore understand within all things, but not included without all things, but not excluded: and therefore to be the interior, that by his uncircumscribed magnitude he may include all things. Therefore St. Dennis says: That all things may be affirmed of God, since he is the author and governor. On the contrary, that all things are more truly denied of him, since he is nothing of those things which he created. Which seems to me more acceptable and more certain, as well by the variable course of this world, as for the unsearchable abyss of his most exalted divinity. For God has placed the greatest distance between him and the created things. But God is truly immense and ineffable, not to be discovered, not to be understood, above all imagination, above all thought, above all understanding, above all essence, unnamable, to be by silence alone proclaimed in the heart: the most powerful, the most wise, the most clement: the father, the world, the holy spirit; and altitude incomprehensible, a trinity indivisible, an essence immutable. Whose image is all Nature, though the eye never be so intent. Who is the unity of all creatures, and main point, and the only one; who is stronger than all power, greater than all excellence, better than all praise. Whom the divine Plato made to inhabit in a fiery substance, meaning, that is, the ineffable Splendor of God in himself, and love around himself. Whom others have asserted to be an intellectual and fiery spirit; having no form but transforming itself into so ever it would and co-equalizing to all things universally. Who in a manifold way is as it were joined to his creatures. Again going forth from that his infinity eternity and omnipotence, he by a fervent love, sincere faith and solid hope may be imbosomed in the purified minds of men. Let whom be blessed for all thousands of thousands of ages.

We said a little before that God was unnameable, whom Martinus Capella says that Arithmetica saluted by a proper name, when going to salute Jove, she with her fingers folded down into them, made up seven hundred, ten and seven numbers. But what that most noble number means, and its division into its members, the Arithmetician knows; not he who inquires into the mercantile way of numbering but into proportions. In this number we discover all numbers, and every proportion both musical and geometrical. Add something of greater moment. That in these numbers the name of God is most exactly found. Whose most holy and forever adorable name is in this fullness of time set down in five letters. When in the time of Nature it was

written with three, and of the law with four. We say moreover that God has every name, because all things are in him, and he is in all things: as shall hereafter be disputed of, and yet has no name, because a fitting name cannot be given to the divine majesty. But how much mystery and strength number has in itself, I easily believe the Pythagoreans knew very well, who called one number Pallas, another Diana, another the father, another the mother, and finally one the male, and another the female: and those who had the greatest knowledge in the numeral science, applied the monas the united to God the creator: But the dias or duality to matter: to forms themselves the virgin trias or three: then to man and to his life hexas and heptas the six and seven. But the enneas or ten they not a miss did very handsomely apply to all creatures.

But to return to the purpose, hear Dionysius repeating: That God is in all things, or all things are in God, as numbers are in unity, as in the center of the circle are all the right lines: and as the soul is the strength of the members. Because as the unity is the common measure, fountain and original of all numbers, and containing in itself every number entirely cojoined, is the beginning of all multitude. But guiltless of all multitudes is always the same and immutable; so in like manner are created things toward the creator. And as an individual soul, is the ruler of its body, and the whole present to the whole body, and to every part of it: so God is everywhere in this world and fills and governs, and perpetually preserves it by the virtue which he daily infuses liberally into created things out of the eternal fountain of his spirit. From whence we rightly by a certain similitude of the soul, do call the God of Nature or the power of God, by which he maintains all things, a soul, a middle nature, or the soul of the world. Not that the world itself is an animal, which we may explode from the entrance into christian philosophy, partly in the christian metaphysick, and partly in this consideration of the stone.

But sublimeness of the Nature hereof requires to be composed in a loftier style; we have here chosen a lower sort of speech; and we place the soul of the world chiefly in the sun. For there is nothing in the soul of the firmament, beside a soul, which represents a greater similitude of God than light itself. Since everything does challenge to itself so much of God, as I may say, as they are capable of light. And since nothing is more conspicuous bright-eyed than the sun, many of the platonicks chiefly imitating Orpheus herein have termed the sun, the eye of the world. Because all things were seen and shown themselves in it as in a certain most bright mirror. Hence Heraclitus says, that all things would perish, should you take the sun out of the world. What is this small body of ours, if the soul be away? No vein having a pulse is to be felt there, there is in it no show of sense, no vital breath nor any respiration therein. Wherefore it also seemed good to some to call the sun the heart of heaven. Because as in the heart there is the only fountain of blood moistening and reddening the other members of the human body, and infusing a vital motion: So there seemeth to be in the sun the vegetation and preservation of all, as well inferior as well as superior things. Because he by this light inspires as it were, life and heat into inferior things. But light is a certain simple of single action converting all things unto itself by an enlivening warmth, passing through all beings, carrying their virtues and qualities through all and dispersing darkness and obscurity. Phoebus therefore resides in the middle with his refulgent locks, as king and emperor of the world, holding a scepter of the government: in whom that there is all the virtue of the celestials, nor only Iamblichus, but many others have confirmed. And also Proclus says: At the sun's aspect, that all the powers of all celestial things are gathered together and collected into one, which we believe are gathered together and collected into one, which we believe are at length through his fiery breathing have spread over this lower world. This also may be even a mighty argument to you: that the sun approaching toward us, the earth grows full of herbs and ripens, but when he departs it withers. But I now delight to make some comment on the infancy of Nature.

## Chapter 9. Of Nature.

We affirm Nature to be a certain power implanted in things producing like things out of like. For Nature generates, augments and nourishes all things. Wherefore it has in itself the names of all things. An animal is from Nature; a stone, wood, a tree, and the bodies which you see are from Nature and her maintaining. Nature is the blood of the elements, and the power of mixing which brings to pass the mixtures of the elements in everything in this sublunary world, and has imprinted on them a form agreeable to their species, by which that thing is distinguishable and separated from each other thing. Nor is Nature of any colour, yet a partaker and efficient of all colours: also of no weight, nor quality, but finally the fruitful parent of all qualities and things. What is therefore Nature? God is Nature, and Nature is God: understand it thus: out of God there arises something next to him.

Nature is therefore a certain invisible fire, by which Zoroaster taught that all things were begotten, to whom Heraclitus the Ephesian seems to give consent. Did not the spirit of the Lord, which is a fiery love, when it was carried on the waters, put into them a certain fiery vigor? Since nothing can be generated without heat. God inspired into created things, when it was said in the generation of the world; increase and be ye multiplied, a certain germination, that is, a greenness, by which all things might multiply themselves. Whence some more profoundly speculative, said that all things were green, is called to grow and increase, and that greenness they named Nature. But Aristotle says: That motion being unknown, Nature is unknown, since it is now volatile and in a continual motion of generation, augmentation and alteration, which at length in the latter end of the world, shall be stable and fixed. Because God will then take away from things that virtue and power of generating, and will place it in the most inward treasure of his omnipotence, where it was from eternity. I therefore had a mind to call this virtue of generation and of the preservation of things, the soul of the world. Not that the world is an animal, as the Platonick accounts and the testimonies of the Arabian, Egyptian, and Chaldean Astrologers seem to approve. For the Philosophers maintained the world to be an animal, and the heavens and the stars to be animals, and the souls of things to be intelligent, participating of the divine mind. Moreover that a God or certain soul presided over everything and that all things were full of Gods, was the opinion of Democritus and Orpheus and of many of the Pythagoreans: to whom they ordained divine honours. And to the same they dedicated prayers and sacrifices and revered them with diverse sorts of worship. Besides they reduced all such souls into one soul of the world. They likewise referred all their Gods unto one Jove. This Aristotle and the Aristotelian Theophrastus, this Avicenn, Algozeles [al-Ghazzal]; this the Stoics and all the Peripateticks do confess, and with their utmost power have endeavoured to prove. I do not doubt but that from hence sprung all the error of gentilism: from hence the fictions of the poets, the diabolical sacrifices and sacreligious victims. Hence the Egyptian land did in their chapels worship and adore some certain animals and other prodigious monsters. Who will not say therefore that the philosophy of the heathens is vain? Which was most miserably ruined by this common error, and by many others: where the philosophers seemed to me to be most like the beehives, or children busying themselves with bottomless vessels to drain a great well.

Yet we may think them worthy of forgiveness since there had not shined to them the true light, Jesus Christ the saviour. Therefore it behooves the Christian Philosopher whose authority is graver, and judgement more certain to bring within the verge of the Catholick Church, which things so ever seem to make for the obligation of the nature of the faith as being possessed by unjust heirs: after the manner of Virgil who said he gathered Gold out of the dunghill of Ennius. Also like little bees, while they suck out the sweetest among

the flowers of Hymettus and Hybla for the sake of making honey. Who is there who would not bewail with tears, the untimely death of Picus of Mirandolla, whom the fatal sisters have particularly envied to our Age. Who had he little longer enjoyed life; would have trimmed up with new beauty, the tattered and begging philosophy, blotting out all of its errors. Yet let everyone highly praise the lawful Philosophy, whose foundation is Nature, or the world, and which prescribes manners and virtue to man. Which does correct for you the first youthful years and rudiments of your life. Which challenges to itself the interpretation of Nature, and the search of things the most abstruse from our eyes. Most worthily true to which the scanning of divine and human things should be referred. We thereby as much as we can by the divine favour and by natural light inquiry into the recesses of the world, into the earth and the tracts of the seas, and the high heavens. This describeth heaven and the immeasurable multitude of stars, as also the journey of the golden haired sun, and the laborious eclipses of the moon. This, with a geometrical staff, describes the ways of the stars.

*This teaches the Aeolian bellows and whispers of the winds,  
Which Hippotades does with his scepter rule.  
Why the mass of the earth does stagger, what makes  
The rainbow's arch, and hoary snows and frigid frosts.  
What breeds the dew, the lightning, what the hollow  
Fleeces of the clouds, the swellings of the Earth,  
And the three forked thunderbolt.*

What gathers showers, what the glazen hail; What are the seeds of gold, what of Iron; whence cruel thunder, whence the fountains of continual waters take their beginning, and such like other things. Let tender youths in their minority learn that philosophy; and everywhere avoid the doting fables of those philosophers who hold the world to be animal, and that it consists of innumerable animals, and those divine. What is more vain, what is more idle? For what else is it to say, the sun is animated, or the celestial bodies are animated, and participating of the divine mind, than to fall into an evil heresy, and the abominable falsehood of idolatry? Neither is it to be granted (witness St. Augustine) that those sidereal globes doe live by certain minds of their own, and those intellectual and blessed. I doe certainly know that only a human soul is divine light, created according to the image of the word, the cause of causes, and the first pattern; markest with the substance of the seal of God: and whose impression is the eternal word. By a participation of which we believe the brutal soul to subsist, taken out of the bosom of Nature, seeming to have a slender similitude and small footstep of a rational Soul, as the echo is the image and resemblance of a living voice. But let others look after the vegetable soul.

The theological doctors admit intelligences movers of the orbs; not that they inform the orbs themselves, or (according to the opinion of St. Jerome) make them intellectual and sensible, but to assist them in moving. Though also those orbs might (the divine Will so commanding) be voluble of their own accord. Yet the omnipotent God out of his ineffable bounty, would have second causes to preside over this worldly fabric, that whosoever does move themselves, does also give to others the power of moving. Whence also he also deputed angels for the custody of human souls, though he also primarily guarded himself. Yet it is not to be thought that such like Intelligences are necessarily applied to turn the spheres, as if they could not be turned about by their own rotation; when some busy men do in like manner frame that heavenly machine of copper or brass, fixing the earth in the very middle. Then they afterwards with certain little wheels affix the other elements, also the orbs of the stars and heavens, whereby they endeavor exactly to express the motion of the planets and the face of heaven. There are other curious men who endeavor to frame clocks and also certain

mills which should turn perpetually. If man can imitate the divine method, who would not believe that those sidereal globes by their own power may be wheeled about?

But what shall I say of the vain astrology, which our Picus of Mirandolla, famed in all sorts of learning, has sometime since by forcible reasons overthrown? Tell me, why astrologer, why refer you all things to heaven? Why do you romance about the natures of the stars and the signs, and of the motions of the planets? Who can by no means guess at the force and property of even the least terrestrial thing? Why should you fear the constellations and the stars, or rather lie? Who cannot by dimensions comprehend any little earthen body. What is more ridiculous, what more absurd, that have not in the ninth or tenth heaven to catch at such figurations and images of lines, or at the figures of the eighth heaven from the wandering application of the stars? What power do you think such imagined images have? What do the triplicities, what do the aspects of those stars and the rest of such like books void of the truth and virtue pretend to? Although such motions and the natures of the stars, and various applications of things to one another should seem to have some signification, yet I am persuaded man cannot well know them unless it were shown to them by some miracle from heaven. Hence St. Jerome thus derides astrologers and nativity calculators. These are they who lift up themselves against God's knowledge and all which is acted in the world, promising themselves a fictitious science, they refer to rising and setting of stars. These are they who are vulgarly called mathematicians, and think human affairs to be governed by the course and ways of the stars: and when they promise safety to others, know not their own punishments. I, while I was yet in the city Agrippa played thus upon the Astrologer. In my opinion it commonly happens to those Astrologers, as it did to Thales Milesius heretofore, who when he went out of his house to gaze at the stars, is said to have fallen into a ditch underneath him. Who when he ridiculed an old woman, being laughed at by her, he returned home with shame. Wherefore, O Christian philosopher, send away into perpetual banishment beyond the Caspian mountains, such like foolish chattering of Astrology, and its daughters Geomancy, Hydromancy, Pyromancy, Necromancy, Soothsaying, and many other such dotages with what other vulgarly resembles them and do not attribute to his creatures the glory of the omnipotent Lord God. Now let us see what Nature the philosophers inquired after.

## Chapter 10.

**What the Philosophers, and what sort of Nature they would have: where the spirit is said to be the ethereal chariot of the soul.**

The stone which the philosophers do seek is an invisible and impalpable spirit; it is a tincture and a tinging spirit: which indeed another visible and palpable spirit has hidden in its innermost bowels. Even so the Philosophers have left us the same spirit undiscovered, under the veil of Ænigmas that the stone is a fifth separated from four. It is the bond of the elements, the medium and the chain, which has made the elements of God agree, and which in the womb of the earth conglutinated Sulphur and Mercury into a metallic body. And because such a bond, as is in the earth, since it is invisible cannot be had, the philosophers sought after it in the more perfect body. The Philosophers do therefore inquire after the generative Nature, which may be able to generate metals, that they cleanse it, and make it a hundred thousand times more potent in tincture than it was at first in Nature. And they accustomed themselves to call it a living fire, or the living fire of Nature, or by a secret word, The Soul of the Middle Nature. And as physicians distinguish man into body, spirit, and soul, in like manner the philosophers have divided the stone into those parts. Sometimes the spirit is the life of the soul, the soul is the life of the spirit. Again those two are the life of the body. The spirit is

also the tie of the soul and the body, and as it were the ethereal chariot or vehicle of the soul, which spreads abroad the virtue of the soul through the whole body. You may also understand the four elements, when the philosophers affirm that the stone consists of body, spirit, and soul. For the water is spirit; also Air: the middle Fire, as I may say, is spirit. The earth we call not spirit but body, because it is the retainer, the matter and the seat of the other elements.

## **Chapter 11.**

### **Teaches that Solution is Necessary, by which the generative spirit is brought out of the body.**

But such a tie cannot be easily had, by reason of the most strong compactedness of gold itself, except by solution, which is the foundation and beginning of this noble science, in which the arcanum of all Nature does consist. It is the treasure of this affair. 'Tis is which lifts up the poor man from the dunghill and equals him to kings and princes. Whence the philosophers demand why the bodies, that is, gold and silver are dissolved. They answer: That the pure may be separated from the impure. For the body is for this reason dissolved, that the earth itself may be cleansed in the profundity. Which Nature could not, because she operates simply [or singly]. And in that cleansing the impediments of the tincture is away, so that it may innumerably propagate its like. But if so be that this propagation of its like be made by the spirit, since every spirit is the author of generation, and it is hindered by grosser matter, we say that solution is necessary, by which gold may be made living, and as I may say, spiritual, and be reduced into the first Nature, that is into the spirit of the water, and the vapour of the earth, that there may at length be had such a sulphur and a mercury with us, out of which metals are generated, in the womb of the earth. But solution is perfected when you shall have separated the soul and the spirit of gold. But because with philosophers gold is the most temperate body, having equal parts of hot, cold, moist and dry. Therefore it may with the more difficulty be corrupted and dissolved by reason of the equal agreement and proportion of the elements. Therefore there must a disagreement be made among the elements by contrary elements: and this discord makes a solution and mortification of the body: which being done there is made a cleansing mundification of Nature, which nevertheless cannot be done without a physical separation of the elements. But the elements of the body must be so separated, that the generative nature may remain in its flower and bud. That if anyone should burn that flower, and separate the elements from one another, the generative sperm would be lost; nor would any creature be able to join them anymore, so as they should generate. This is the truest consideration of the philosophers. If any out of his own fancy consider otherwise, he is indeed a natural fool, and makes syllogisms against Nature.

## **Chapter 12.**

### **Disputes of Hidden Things in the Art, and about threefold separation.**

But ye sons of wisdom, there are three solutions in the physical work. The first is of the crude body: the second is of the physical earth: the third we place in the Augmentation. There are also in the solution these three hidden things: the weight, the measure of time and fire. Wherefore if you know the weight of mercury and gold, and the measure of time, how long solution is in the making, and in a temperate fire, you have solution: which ought to be made in the secret Furnace, and a little larger glasses. Wherefore diverse fires

are to be procured, and so different parts to be put in glasses; that you may at last endowed with divine favour, find it out. You must also distinguish in this admirable work the days, months and years of the philosophers. The philosophers affirm, that if you, you may make the trial in three natural days. That if you are of a sprightlier wit, say they, you may distinguish it in twenty four hours. They in philosophy have appointed two nights and three days. Beseech the greatest and highest God that you may be worthy to the last red day. The philosophers also lay down three keys, solution, conjunction, and fixation. Or if you profoundly understand them, three separations. First there is made the separation of the soul from the body by the spirit. Secondly the grimes themselves, which have shown themselves in the solution, are separated from the soul and spirit. Lastly the spirit shall be separated from the soul and this happens in the fixation of Nature: so that hereafter and here I shall have told you so great secrets, that it cannot be believed. I do faithfully affirm two keys in the whole circle of philosophy. The first indeed which opens the body may be distributed into several keys. For what thing soever shall dissolve gold and reduce it into a spirit is called a key, though only one among others be the most powerful and natural key, as I wrote in chapter 8. And such a thing is called the stone. The second key which shuts up and does retain and coagulate the tinging spirit, we term the earth alone, which all philosophers have called the principle Stone. But of the crow's head we freely profess, that all the philosophers from the beginning of the world have had so little, that it can hardly be believed. Yet the miserable Philosophasters have thought that blackness which appeared in the superficies, out of the superfluity of the mercury and the body to be the crow's head.

### Chapter 13.

**Treats of the Praxis of the Stone, of its first solution, and separation: where the arcanum of Nature, otherwise most abstruse, is laid open to a son of wisdom, in which Lucifer falls out of heaven.**

'Tis now time, O son of wisdom, to turn my pen to the practical part, where I would first warn everyone given to philosophy, that all kinds of salts, allums, and of many other and of foreign things are in vain, and bring with them nothing moment or efficacy. Likewise that all common solutions and vulgar sublimations are adulterate works and belong nothing to the true and natural science of the philosophers. Wherefore I judge those mountebanks are to be avoided who with their dealbations and rubifications have cheated almost all the world, in whom there is no vein of philosophy, which is warm, and who are rather to be esteemed false philosophers, since nothing is dearer to philosophers than the truth: nothing more foul than falsehood and deceit. Whereby it comes to pass that there are fewer philosophers, than you have perhaps believed. Now let us descend to the praxis, which we will divide into two works. In the first mention shall be made of the first solution, and of separation and distillation. In the second we will treat of conjunction and fixation, where consideration will be had of the most secret augmentation, which you will find in no book in the world. But here I have a mind to bring in the degrees of all the work wholly. For first we compound, the compound we putrefy, the putrefied we dissolve, the dissolved we divide, the divided we cleanse, the cleansed we unite, and so the work is accomplished. But to speak of these, each particularly, shall be our labour. But the philosophers are of opinion that in the praxis of the stone less than a twelfth part of mercury ought to be taken. But there is also among them a trial of the dissolved body, if it be squeezed through a leather.

Some also of the more modern have thought, that solution may be made in a shorter time if a long pounding or grinding of the gold by itself were first made by a certain mill or in a mortar. First therefore let the copper be purified with common salt prepared or with any other fitting thing, that its most subtle substance

may be had. Let some parts of this purified water be mixed very well with one part of the most fine Gold, reduce into leaves or thin spangles, and let them be put in a long glass with a hollow belly, stopped with little pieces of cloth, and with the sign of the cross, and let the glass be covered with ashes, up to the superficies of the water, and let a very small heat be given, that the matter may not seem to ascend, but remain live with the gold, and let that equally balance heat be kept so long a while, until in the water of mercury there out upon it a certain vaporous and subtle earth, which in a wonderful colour is wont to be known when it is to be extracted. But the sulfur itself shines like a rainbow through the waters, yet not with all colors, like the rainbow in this greater world. The arch is itself of the rainbow stands half in the pure liquid and fluent water, and half upon the earth. Hence the whole property of and its natural similitude is shown by the iris, the rainbow: nor is the rainbow seen in heaven, but when the sun shines, which also uses to be followed by rain. But mists or thick clouds coming on, the sun itself, and also the arch of the rainbow is hidden. It pleased the natural philosophers to thus explain the rainbow: when the sun colours a moist and hollow cloud, and is thick like a looking-glass, and intersects the middle of its orb: which comes nearer to our divine and admirable science. Yet it is not to be thought that the Sulphur itself grows black when you extract it, as some have thought. The copper being at length extracted, you shall distill the water, in which there is the soul of gold or the metallic mercury of gold, with a slow heat, so that three core minutes may be counted between drop and drop. And that distilled water is called, our living water, which enlivens all bodies, and is composed of two natures: understand spirit, soul, and ferment, because the spirit is the seat of the soul, and its retaining bond. And this water is called by many names, the most sharp vinegar, lunc, the woman's sperm, or the feminine menstruum, heaven, mercury, the hair of the red man, that is, the spirit of Sol, that is of gold: But the Sulfur is called the body, the male Sol, the male sperm, earth and mercury. But these distillations are necessary, by which mercury is purified from all terrestrial feculence, and Lucifer, that is, the uncleanness and the accursed earth falls down out of the golden heaven, and here a separation is made of the grime from the soul, as I disputed in chapter 12. Here a lofty similitude: heaven, that is, gold was pure in the original but when it was dissolved it showed corruption. Therefore the first evil was in heaven, while as yet there was corruption and Lucifer, after whose fall heaven was so cleansed that no angel can now fall down out of the golden heaven. But if so be that Lucifer had had within himself, a soul of a middle nature, or a God, he could by no means have been thrust down to the infernals.

#### Chapter 14.

**Disputes about the Second Part of the Praxis, where there is a more secret dispute about the fire and the colours: and these questions are resolved: Whether heaven ought to descend to the earth: Or the earth ascend into heaven: Or whether both ought to remain beneath heaven? Where the spirit is compared to an angel, who seems to descend with a human soul into a body.**

There now remains the second part of the physical praxis, the far harder indeed, and far more sublime. In which we read that all the nerves of wit, and at length all the races of the mind of many philosophers have languished. For you would with more difficulty make a man revive, than put him to death. Here the work of God is required. It is indeed the greatest mystery to create souls, and frame an inanimate body into a living statue. Do you not think it is the business of a sprightly Wit to reduce the soul to the spirit, then the spirit to the soul, then again those two to the body? In this body of ours, it is requisite to know, how much the spirit is, how much the soul, and how much the body. Furthermore how much of the soul the middle nature, is in the spirit, and how much in the body, that by this you may join as it were two natures of the same kind, and

akin to one another in due proportion. We ought therefore to join two waters, the Sulphur of Gold, and the soul and body of its Mercury, Sol and Lune, the male and female, two sperms, heaven and earth, and two, as I may say, Argent vives, and out of which alone the philosophers say their stone is made; which pitiful fellows mistake for crude mercury. But that mercury is all metals, male and female, and an hermaphrodite monster in the very marriage of the soul and the body, which I call solution; and the putrefaction of the philosophers. The earth of gold is dissolved by its own spirit, which you shall discover in these proportions. The body must be dissolved in the subtlest middle air: The body is also dissolved by its own heat and humidity; where the soul, the middle nature holds the principality in the colour of blackness all in the glass: which blackness of Nature the ancient Philosophers called the crows head, or the black sun.

From whence a certain person advanced this proposition. I saw three circles encompassing one another, three suns in the firmament having three faces, that is, a black, a white, and a red sun. That blackness was also called by the name of all black things; after which all the colours of the world, which can be conceived by wit, use to appear, which at length are brought to a true whiteness, as to a center and principle point. In white there are all colours, and from that the rest seem, as I may say, to be coloured. White and black by Nature herself are colours, and indeed the extremes, out of the manifold mixture and proportion of which with one another we believe the middle colours, as they are called, to arise. We hold also that from the confounding black and white together there is prepared a certain redness. But that whiteness we call the white stone, the white sun, the full moon, and calcined Lune, white silver, the white earth, fruitful, cleansed and calcined, the white Calx, and the Salt of the metals, and the calcined body, and we call it by many other names. It is moreover called the living earth, and the living and white Sulphur, when the soul has been reduced into the body, and the Impediment removed. Here we resolve this question: Whether the earth ought to be airy or fiery? We say both at once. If so be it were only fiery, it would be burned into the ashes of the dead. But if only airy, being made volatile it would vanish away in tinging metals.

But what shall I say of the fire whereby the dissolution of the Earth is made? Behold the heat in the bowels of the earth, which Nature alone supplies: where you seem as it were to perceive none; which being then excited by the sun's heat, does in the metal-breeding mountains by ascending and descending for many cubits coagulate everywhere the thicker water, and together with the fatness of the earth associates them into one body. But since Nature does scarcely sometimes in five hundred years effect her operation, and so long an enjoyment of life is not granted us, nor we permitted to live beyond the elephant, or to the year of Plato, as they call it; the philosopher allows a greater degree to the fire, that he may in a shorter time emulate Nature as his guide. Wherefore you with good reason will say that he excels in a particular happiness of disposition, who can show you the fire agreeable to, or of, Nature.

The philosophers call their natural fire a bath, or their sun, or horse dung; which some make with wood, or any other matter; but we with coals, especially in a furnace fitted for this purpose. The stone is also to be made in a threefold earthen vessel, that there may a slower fire be had, very much like, I say, to the heat of a hen, while she sits on her eggs. And with that heat the dragon, that is the earth of Gold, mortifies himself, when he gives elements and spirits out of himself. On the contrary he revives himself, when he hath received the spirits again unto himself. Wherefore he is compared to Jesus Christ, who voluntarily offered himself to death for us, and afterward by his own power, by the glory of his resurrection, restored himself to life never anymore to die. We also say in this place that the dragon spews out of himself all obscurity and venom, and that he afterward imbibes it and is whitened. And because we have said above that heaven ought to be joined with earth, there arises this question: whether heaven ought to descend to the earth, or the earth ought to ascend up to heaven? It is most certain that the earth cannot ascend, unless heaven first

descends, but the earth is said to be sublimed up to heaven, when being dissolved in its own spirit, it is at length made one thing with it. I will satisfy you with this similitude: the son of God descending into the virgin, and there flesh, a formed man is born, who when he had for our salvation shown us the way of truth, having suffered and died for us, after the resurrection returneth into the heavens. Where earth, that is, humanity, was exalted above all the circles of the world, and placed in the intellectual heaven of the most holy trinity. In the like manner when I die, my soul assisted by the grace and merits of Christ returns unto the vital Fountain, from whence it hath descended. The body returns unto the earth, which being at length purified in the last judgement of the world, the soul coming down from heaven, leads away with itself to glory. But because it is requisite that the soul should ascend to heaven, another doubt offers itself: that is whether the spirit ought to pass with the soul to heaven, or whether both ought to remain beneath heaven? We have said that the spirit is in this world the bond of which it retains the soul; but when the stone shall have arrived at the first whiteness, there will be another world far more excellent than the former, where the spirit shall remain in the middle, the soul in heaven, and the body in the bottom. Understand the earth to be the heaven of the soul, contrarywise the soul to be the heaven of the body. And because the spirit has enfeebled the body in solution, they both do penance, and the soul is purged by the spirit, and likewise is the body. Only the soul cleansed from feces ascendeth up into the heaven, and the spirit goes away with its grimes. If so be that that spirit should stay with the soul and the body, there would be a perpetual corruption there, nor would there be made a right agreement and equality of the elements. This spirit you may fitly liken in some things to an Angel who uses to descend with a human soul (when it is infused into the middle point of the heart, and from thence into all parts of the little body.)

We make also the body, soul and spirit speak by the way of dialog, the spirit saying to the soul: I will lead thee to eternal death, to hell and to the darksome house. To whom the soul: Thou spirit o my life; why do you not bring me back again into the bosom from whence by flattery you took me out? I thought myself bound to you by kindred: I truly am your friend, and will bring you to eternal glory: But the body thinks that by reviving it, he makes it glorious. To whom the spirit: I will truly do it, but miserable I, I am forced to be gone when I shall have placed you above all precious stones, and made you blessed. Wherefore I beseech you when you shall have arrived at the throne of the kingdom, to be sometimes mindful of me. To whom the body at length gave innumerable thanks, that he had given it a most excellent being, by which he beheld God as in a looking-glass, and promised to remember him; and congratulates on the chiefest parts or share in the throne of the kingdom.

### Chapter 15.

**Explains this Proposition: In the shade of the sun is the heat of the moon; and in the heat of the moon is the cold of the sun. Likewise how it is known in the moon, the sun ought to shine. What the shade of the sun and the moon is, and that it is necessary that the sun and the moon and likewise heaven and earth be joined, and makes mention of the citrine Aurora.**

We said in the foregoing chapter, that Sol and Lune ought to be joined. We believe you know what Sol is, lastly what Phoebe herself. Cynthia, that is, Luna opens Phoebus, Sol. Phoebus shuts and coagulates his sister, that is Luna. In the very marriage of Sol and Lune understand this proportion. In the shade of Sol, is the heat of the moon. And in the heat of the moon is the cold of Sol. For when the humidity of Luna has received heat and light from Sol, Sol is said to enter into Luna, at whose entrance Luna revives, increases and begins to grow warm, but Sol to grow cold and moist; because he hath received water to himself and

hath lost heat and dryness, whereby losing his share of light, he becomes dark. But when Luna shall go into Sol, Sol himself begins to revive, and Luna bereft of brightness grows thin and is obscured. From whence I assert that the shade of Sol is the coldness and moisture of Luna, but that the shade is the day of Luna. Take the shade therefore from Sol, and his whole light is everywhere dispersed. Yet think not that Luna can take light from the sun in one little space of an hour, but the body is dissolved by little and little. In the beginning when Phoebe is joined to Sol, she is set on fire by him, who being enkindled is seen to shine by degrees before midnight; but when she has filled up her whole orb, she uses to enlighten all the night. Who decreasing again and growing dim for want of light, the heat of Phoebus begins to be vigorous. Where you will plainly know in Luna when Sol ought to shine, if carrying with you the meaning of my writings, you run it over inwardly in your mind; though it may also be understood by other industry. When Luna, that is, the white stone shall begin to grow citrine and red, it is a token of Sol shining. The beginning of redness is Aurora. Who would not call Aurora citrine? Tithonia, that is, Aurora seems to be bound to this common office to redden the air, and with the first light to show the rapid journey of Phaeton, that is, of Sol. Where at length yellow Eous pours out the quick sighted light from the eastern climate, which seems to be the soul. But that, as it is argued above, it is necessary that Sol go into Luna, then Luna into Sol, we discover two intermediate impediments in heaven, Venus and Mercury, which being taken away there will be a wonderful copulation of them, which being done, Luna will no more lose her light, but shine with lustre of her own. And Sol, in a like manner: and the last day of the former world will come, after which there follows another world, and another life, where there will be either a perpetual day with those above, or a perpetual shade with those below: And fire will descend from heaven and shall again ascend up to the golden heaven, that is, shall tinge the imperfect.

### Chapter 16.

**Of the Augmentation it self of the Stone, both of the ancients and the modern Philosophers: and it is concluded that there is but one day and one night. Again seven days from the seven lords of the world.**

It now pleases me, O son of wisdom, to bring that physical pinnacle into the happy work. Then move the oars, spread the sails abroad, give a swift and prosperous wind, the safe haven is to be looked for. After our stone is made white, we call it our begotten son: though now a child it is a perfect man, consisting of a body and soul; yet it is not able to get another progeny, unless it be first bred up with a nourishment of its own nature, until it arrives at an age mature for generation. We have received from these ancient philosophers, who operated in Nature only, that their living water was divided into two parts. Who when they had with one part of the water attained to the fixed whiteness, they rubefied it with the other part of the water which was reserved, or perhaps with fire alone. Others in the red stone, because it hath ascended to the highest degree, and cannot be increased by itself, have begun again those works, which they accomplished before, dissolving that redness with the other part of the water, which they had reserved, they again reduced it into the first essence, as I may say. And they worked almost in all things as from the beginning, but truly with a greater industry both of the fire and of the labours: and I believe this repetition to be the truer and the greater augmentation.

Wherefore also the first philosophers used a longer time in finishing the stone. Which their successors and posterity used to end in the course of a year, so that they augmented the white stone (by which they would tinge into silver) with a lunar sperm throughout the whole, or by adding to it other spirits, namely white

ones drawn out of tin, and lead by sublimation. Moreover they rubified the white stone with the solar sperm, or other reddish spirits out of iron and copper. And this you may judge was done not amiss, since those inferior bodies have much tincture in them. If so be you should take what is the more perfect out of those bodies and should add it to the more perfect body, what doubt is there that the whole would be made perfect? And such like inferior bodies are called spirits when we say: Dissolve the body, that is the stone already made, and join the spirits. They are also called children when we say: children play with the stone, when they make it greater in weight and virtue. Whence also we in other works know the urine of children of four years old to be the water of the four inferior bodies; which since it is called the aqua fortis of the Philosophers, is said to dissolve gold: out of which things we do not deny but that a certain stone is made.

The mineral stone we distinguish in three ways. The stone of the Philosophers is made out of gold alone and Nature alone; and that is the more sublime; which is by the philosophers reported to cure all sicknesses. The second is the simple stone, when the root only, and the sulfur of gold or silver is in the end augmented by the spirits of the inferior bodies. Where these weights set down in the lesser Turba are discussed: One to three, or two to seven, wanting only a golden or a silver sulphur.

The three red spirits are reduced to the golden, the three white ones to the Silver sulphur. Now there are two sulphurs and seven spirits out of which the number nine proceeds and is made up: Concerning which most men have even unto this day, made foolish comments. We say that the sulphurs of all the metals with their spirits make up the third stone. It is by the most prudent in philosophy thus determined that the stone can tinge innumerable parts. That every spirit is multipliable, but no body. And since our stone is made extremely volatile, and as I may say, spiritual and all fiery, and nourished in the fire by a long decoction, and very often repeated by very many solutions and coagulations, why may you not believe that that stone can tinge innumerable parts? If you with judgement do inwardly apprehend the way of Nature and her admirable properties. The more often you shall have dissolved it into the white Sol, and again coagulated, the more it will tinge. Also the more wives a man shall have taken, the greater issue he will have.

And a certain philosopher says this: If you shall have given it tincture, it will tinge as you would have it. Which may also be seen in corn and seed, since out of one little grain many are produced, out of which often repeated, there uses to arise at length a rich crop. Nor will this be a lesser argument, if to the sun and moon first conjoined you add their children; that is, the inferior planets, and the planets are the lords of the world, who govern all this mighty mass. What should hinder it, but that the stone composed of all ye metallic things may by tinging the whole world. The same is also manifest concerning the stone out of Gold only, because Sol is the Lord of the other planets, and the rest of the planets take from him a golden lustre. From whence it may be concluded that there is but one day and one night in the whole age of the world. Again seven days from the seven planets, and those days one day; because the sun is one: the brightness of the sun, is day, which shining on you, all trouble and calamity does fly away from you.

## **Chapter 17.**

### **Explains Certain Obscure Proportions laid down in the books of this science.**

The Samian Pythagoras when he received scholars into his college to be instructed, is said in the first place to have given them this command; not to publish to the vulgar any of those things which were treated of in their schools. Wherefore he made his hearers be silent for the space of five years, that it might not be lawful

for them either to ask their master, or discourse of those things among themselves. Which custom the Pythagoreans following, at length their memory failing, they begun to put into writing those things which they had learned of their master, as well concerning the principles of things, as concerning divine things: so that the secret marrow of those things should be hid in the sacred obligations of numbers. Which that Plato also did (who by doubtful similitudes and mathematical figures hid his precepts is shown by his epistle which he writ to Dionysus concerning the nature of the first being. We must write, says he, by ambiguities and Ænigmas, that if the book happen to be cast away by sea or by land, he who should read might not understand it. This I also judge gave occasion to the poets to make their fables, whereby, least things sublime should pass away to the unworthy mob, they laid up the sweetest food of philosophy under the essential bark of little fables. We read that the Egyptians to preserve their determinations, in their holy places, hid them in letters difficult to be known, that is in certain figures of animals, as being the print or sign of Nature. If I well remember there was the effigy of a vulture. A dragon drawn into a circle, and biting his own tail, made out the image of the running year. Do not some more curious people endeavor to ascribe everything to it's proper character, whereby there might be a more hidden remark of that thing. Thereby it comes to pass that those ancient philosophers were of opinion to deliver this divine art under more obscure words. The cause you'll find in chapter 7.

Wherefore I thought it requisite and worth the while, if I should explain to you, as to a son of philosophy, some obscure propositions, by which you may easily canvas others which occur. The philosophers say that their stone is found everywhere, in the mountains and in caves. From that proposition evilly understood, I am persuaded that all the errors were derived down to posterity, who works in blood, eggs, hair, and other vain and foreign things. Do you understand it thus. As the celestial sun itself, by its rays is everywhere in this greater world: so this terrestrial Sol, that is gold, is everywhere in the whole glass, that is, in the lesser world: in the mountains, that is, in the head of the glass and in heaven: and in the caverns, that is the bottom of the glass and in the earth. They say the stone is bred in two mountains: in heaven the mountain and in the earth, another mountain, understand it in the glass. Furthermore they affirm their stone to be in all things: that is, in all metals, which are their things. The stone also is in everything, that is, Nature is in everything. And because Nature has in itself all names, and Nature is all the world, therefore the stone has many names and is said to be in everything: although one is nearer than another: since the philosophers demand the generative nature alone of metals. Whence they say that the rich; that is, the perfect bodies, that is the gold and silver have that nature, as well as the poor, that is, the imperfect metals. Yet the nature of gold or of silver is the more perfect, and the more permanent in the fire, than the rest of the metals. The Philosophers also seek a fixed and a permanent thing, which may govern all the world, namely, Sol and Lune. From whence they anciently call the Sun the lord of the world: in whom there is life to heal all things, who by his motion makes day and night, and illuminates the whole world with his brightness. Wherefore Sol says, I am the stone; or in me is the stone. The philosophers also say: That the work of the stone is the work of a woman, and the play of children. The woman is sometimes the earth, sometimes the Mercury, which seems to perfect the whole work. The children play with the stone, that is, the three elements with the earth, or the inferior bodies play with the golden stone, when they augment it in the end. Likewise, children play with the stone and cast it away, that is, ignorant and unskillful folks cast away the earth itself in the bottom, when they have made sublimation. Some Philosophers have compared the work of the stone to the creation of the world. Likewise to the generation of man, and to his naturalness.

But the more modern philosophers have hidden this knowledge not only in new words, but also in painted images. I have seen painted by a most goodly pencil, A naked virgin, of a tender age, with hair like ivory, black eyes, white and red cheeks, whose breasts were milky, very smooth and round. And that virgin was

in all the beauty of he body so excellent and so handsomely adorned with all the endowments of Nature, that she might be thought most worthy of a royal bed, and with whom also all Philosophers, both the ancient and the modern might be deeply in love. Such as the poets use to describe Venus, or Juno, or any other beautiful maid or damsel. But that nymph had in her hands hung down, two mighty burning torches, and under her right foot there was a golden stone out of whose bosom a certain golden fountain ran forth into many little veins. Under her left foot there was a silver stone, vomiting out of itself a silver flame. On the right hand Titan himself was painted, with his rays sparkling all round about. On the left were described the Horns of Phoebe: there flew about certain birds partly upward into the air, partly downward to the earth. At the Virgin's back you see there has grown up a tree replenished with diverse apples and flowers, which you would take to be the Tree of Life planted in the Garden of Paradise, if you did taste its flavor and liveliness. Hermes is described in his philosophical mitre, evidently the chief of all the philosophers, sitting in a chair, holding two tables on his knees; in one whereof there were delineated both the globe of the Sun and the horned Moon; under whom there were two birds drawn into a circle mutually swallowing one another; whereof one, the uppermost was painted with wings, the other without. In the other table there were painted three changeable-coloured circles, in the middle of which was the image of the Moon, to whom two suns, one of them darted out one ray, the other two: and nine eagles flew about Hermes' Chair, having in their feet, bended bows, from which feathered arrows were shot down unto the Earth. Has not one Ulmannus a Friar Minorite of the order of St. Francis with a most admirable dexterity woven out our science in his own country's language and mother tongue? And by Christ's passion proved it most true? Where there is seen that double shaped Image, partly male, partly female, that hermaphroditical monster, carrying in its hand a scepter of imperial majesty: and many other things of that kind are seen in the books of the philosophers.

### **Chapter 18.**

**Shows that the Stone can Cure all Sickneses: since all Nature is in the sun, and the sun in Nature, and especially in the stone.**

But that the stone can cure all sickness, of these all the books of the philosophers are full. Yet I will according to my best ability study to demonstrate it. All Nature is in the Sun, and the Sun in Nature. Therefore we may catch his spirit in all things, but especially in gold. And when Nature is sick, that stone cures Nature. In propagating gold Heaven has taken the greatest pains; likewise the Sun itself, and Jupiter. The Sun has put all his endowments into it, by reason of its fiery virtue and brightness. But Jupiter whom the physicians call the patron of life, has infused into it temperance and an equality of the elements. By these gifts Gold is made so incorruptible, that no fire can by destroying act upon its substance and virtue. To these are added the solution of Gold, the purification of its Nature, and a long nourishment in fire, by which it has obtained a wonderful and almost divine operation. If so be you should take in victuals or in drink the weight of a grain of mustard seed, it by its celestial vigor would preserve in an equality the oil and fire of life, and would temper and tie together the elements of your body in peace. Which being tempered, the soul would abide with the elements and man would remain always sound, until that end which the omnipotent God has ordained by reason of the disobedience of our first parent. There was in Christ's body so great an affinity, and so great a binding together of the elements, because he was liable to sin, as also by reason of the wonderful union of the divine essence, that he had never died naturally, had he not for the sake of redeeming, man willingly desired death. Render him perpetual thanks for creating you, for redeeming you from the infernal regions with his precious blood, and for bestowing on you so great a gift as this. Whereby you may lead a long life and have health in happiness, for which chiefly our stone is to be sought after. I say nothing of the plenty of riches, with which a man by this art most fully and copiously abounds. If having the

Aurum potable or the golden liquor, you shall dissolve that stone in aqua vitae drawn out of malmsey wine, or some other falernum, that is, rich wine.

### Chapter 19.

**Repeats the Philosophical Praxis, where the divine skill of the stone is often times all of it set down in short sentences.**

Mix the masculine prince with Mercury in a twelfth proportion in respect of the prince. Put it to a slow fire and continue it, until the mercury dissolving the bodies there appear aloft. A Venus swimming, which extracts until nothing of the body remains in the bottom, and you have the first part of the physical work. The second part of the work is sulphur, put that in a glass without water, and by distilling the water of the body, in which there is the soul of Lune. Join this water with the sulphur, and permit a many times, one to arise sometimes with the other, sometimes to be depressed: until Venus shall have conceived her water, which is done in a most white color, and you have the elixir to the white. The third part of the work is: You shall make citrine with a strong fire, the most white, earth which you have obtained: afterward you shall rubify it by the force of fire, and it is the elixir to the red.

Of another way of working: Still I have a mind to contain in short, and with admirable art that divine knowledge. Dissolve the body, take the Sulphur, cleanse it, sublime the spirit, join the spirit with the sulphur, and you will have the physical art. In every perfect alchemical work, though never so small, it is necessary to have the spirit and sulphur of Gold. The spirit tinges with a golden colour. The sulphur gives the weight of Gold, and coagulates. If it wanted either, the work would be nothing. Then say and speak the greatest truth, that all the secret of Nature lies hid in the Venus of the physical Gold. Wherefore it is wont to be called the coagulation; when it is said: take that coagulum from the body, and you have a magistry, than which there is not a greater in Nature. Likewise cleanse the coagulum, and destroy the impediment, and you will tinge. But because a dirty cloth, not compared to sulphur, cannot be washed without water. To wash is to dissolve, to dissolve is to purify, the water is mercury, it is the key. It alone does open the body, and whitens the sulphur, which being whitened, it recedes with uncleanliness. I would say you were admirably learned if you should be able to remove it, the uncleanliness, it is the impediment and eternal death. Wherefore it shall not go to heaven, as above in chapter 14 I have plainly demonstrated. And I say unto you by God the creator of heaven, it is one of the greatest secrets. Furthermore, the very knowledge of the stone is no other thing than the purification of the earth, or of Nature. The earth cannot be cleared from feces and purged, unless through the middle or center it shall have received the water unto itself. And this comprehends the whole art in short, if you have understood Nature. You may of yourself by divine grace discover many things like unto these. Praise God for all ages of ages.

The end of my Consideration.

*Quere if hereby he affirms himself  
to be an Adept. But there may  
be many reasons unknown to us:  
I question not but the Inquisition was  
the reason of his suppressing his name.*

## **Chapter 20.**

### **Lays down the Questions put by Illardus the Necromancer to the devil, concerning the stone of the Philosophers.**

A certain Necromancer, Illardus by name in the province of Catilania put these questions to the devil.

#### **Whether the stone of the Philosophers can be made, to convert the imperfect metals into Gold and Silver, fire being the judge?**

All metals are essentially in Gold, with their earths in a manifold color. Out of its earth with its own essence the stone is made, which by its Nature takes all uncleanness away, and being projected on the imperfect metals, fixes them forever.

#### **What and what kind of a essence is that?**

It is a soul, a middle nature, which permits one form to be converted into another.

#### **In what manner does the soul, the middle nature, act?**

Neither angels, nor men in any wise inwardly behold or comprehend it by their acutest understandings. Because this is proper to God who reserved this to his own majesty.

#### **Can man make the stone?**

Whatever God has created, having a property, it is possible for man to act upon it, but it is very hard to make the stone, yet it may be made.

#### **The soul, the middle nature has it a body?**

The colour of Gold is the body of the soul, the middle nature.

#### **By what way can the colour be separated from Gold?**

The soul, the middle nature, with its heat and moisture does divide and cojoin both together.

#### **The colour of Gold, is it white, or black or of what sort?**

It is white to man's sight, but in spirit it is blue.

#### **In what manner, and out of what is color made?**

Nature makes it out of a pure earth and pure water.

#### **Is there a colour in all metals?**

Not only in metals, but also in all the elements there is a hidden Color.

#### **Of what virtue, or power is the stone?**

The stone can purify all the imperfect metallic bodies from all leprosy, so that they shall be perpetual even to the last judgement. It cures human bodies of all sickness, until a natural death.

#### **Of what sort, and what thing is the soul of a human body?**

It is the living fire of a heavenly life, and hath in itself, the soul, the middle nature. By the soul, the middle nature, God is called the creator of all things which are in the world.

**Had Virgil the stone?**

Not only did he have it, but many Philosophers had it, and have written in diverse ways about it under obscure names and many operations.

**How and why is it called the stone?**

I tell you that the stone is its name, and there is no permission given me to let you know more.

**In what time can the stone be brought to an end?**

Twelve months are necessary from the first day of the beginning. In thirty days and earth is generated out of lead, or the nature of the earth makes lead grow. In one hundred days argent vive grows in water. In sixty days complete there grew an air out of tin complete. In the other days of the year, fire grows from gold. In the moment of the year ending, the soul, the middle nature, descends from heaven into this earth, and mortifies the superior and inferior powers. The image of a manifold victory to consume the war in the heart of the belly of them, even to the perpetual judgement of fire. I will tell you no more.

# **Compound of Compounds**

by  
**Albertus Magnus**

## **Preface**

I will not hide a science which was revealed to me by the grace of God; I will not jealously guard it for myself alone, for fear of drawing His curse. A science kept secret, a hidden treasure, what is its use? The science I have learned without invention, I transmit to you without regret. Envy disrupts everything, an envious man cannot be just before God. All science, all knowledge comes from God; it is a simple way of speaking to indicate that it comes from the Holy Spirit. No one can say: Our Lord Jesus Christ without also understanding: Son of God the Father, through the operation of the Holy Spirit. In the same way, this science of truth cannot be separated from Him who communicated it to me.

I have not been sent to all, but only to those who admire the Lord in his works and whom God judges worthy. Only whosoever has ears to hear His divine communication receives the secrets which have been transmitted to me by the grace of God, and these He never reveals to those who are unworthy.

Nature must serve as the foundation and the mode of science: the Art also works according to Nature as far as it can. It is necessary then, that the Artist observe Nature and operate as she operates.

## **Chapter I**

### **Of the Formation of the Metals Generally from the Sulphur and the Mercury**

It is observed that the essence of metals, insofar as we know, is to be produced in a general manner from Sulphur and Mercury. The differences alone of cooking and digestion results in a diversification of the metallic nature. I personally observed that in a single vessel, in the same vein, so to speak, nature had produced many metals, along with some silver disseminated here and there. We have clearly demonstrated in our treatise on minerals that the generation of metals is circular, that is, one passes easily from one to another following a circle, the cousin metals having similar properties; it is because of this that silver changes more readily into gold than any other metal.

Indeed, there is not much in changing the color and weight of silver, this is easy, because a compact substance increases its weight quite readily. And since it contains a yellowish-white Sulphur, its color will also be easy to transform.

It is the same with other metals. The Sulphur is, so to speak, their father and the Mercury, their mother.

Again, it is most true, if one says of it that in the union the Sulphur represents the sperm of the father and that the Mercury acts as a coagulated Menstruum in order to form the embryonic substance. The sulfur alone cannot produce, just as the father alone cannot produce.

In the same way that the male begets his proper substance, in mixture with the menstrual blood, likewise, the Sulphur produces with the mercury, but alone it produces nothing. By this comparison we make note that the Alchemist will have to raise at the outset, the specificity of the metal which has given him the Nature, then that he proceeds as nature proceeded, with the mercury and the Sulphur prepared and purified always following the example of Nature.

### **The Sulphur Contains Three Humid Principles ~**

The first of these principles is especially elevated and volatile, one finds it in the exterior parts of the Sulphur, for the same reason, that of the great volatility of its elements, which ignite easily and consume the bodies with which they come into contact.

The second principle is phlegmatic, otherwise called aqueous; it is found in close association with the former. The third is radical, fixed, adherent to the internal parts. That one alone is general, and one cannot separate it from the others without destroying the whole edifice. The first principle does not resist the fire; being combustible, it consumes itself in the fire and calcines the substance of the metal with which one heats it. Therefore, it is not only useless, but detrimental besides, to the goal which we set ourselves. The second principle does not make the bodies moist, it does not produce, it cannot serve us at all. The third is radical, it penetrates all the particles of the matter which are necessary to its essential properties.

It is necessary to rid the Sulphur of the first two principles in order that the subtilty of the third force serve us in making a perfect compound.

The fire is nothing other than the vapor of the Sulphur; the vapor of the Sulphur, well purified and sublimed white and rendered very compact. Also the Alchemists are accustomed to skillfully raising the two superfluous principles in the Sulphur by way of acid baths, such as vinegar of lemons, sour milk, the milk of goats, the urine of infants, etc. They purify it by lixiviation, digestion and sublimation. It is necessary, finally, to rectify it by reduction in a manner so as not to have more than one pure substance containing the active, perfectible brother-force of the metal. Behold! We are in possession of one part of our work.

### **Of the Nature of the Mercury ~**

The Mercury contains two superfluous substances, the earth and the water. The earthy substance has something of the Sulphur. The fire reddens it. The aqueous substance has superfluous humidity. One easily rids the mercury of its watery and earthy impurities by sublimation and very acid baths. Nature separates it into the dry state of the Sulphur and robs it of its earth by the heat of the Sun and the Stars.

It obtains thus a pure Mercury, completely free of its earthy substance, containing no more foreign particles. It unites it then with a pure Sulphur and produces in the end the pure and perfect metals in the heart of the earth. If the two principles are impure, the metals are imperfect. This is why one finds different metals in the mines, which possess of the purification and of the digestion according to their rudiments. This is dependent on the cooking.

### **Of the Arsenick ~**

The Arsenick is of the same nature as the Sulphur; both tint to red and to white. But there is more humidity in the Arsenick, and it sublimes less rapidly over the fire than the Sulphur.

One knows how well Sulphur sublimes quickly and how it consumes all the bodies, except God. The Arsenick can unite its dry principle with that of the Sulphur, they temper each other, and once united, one separates them only with difficulty, their tincture is toned down by this union.

"The Arsenick", says Geber, "contains much of the Mercury; it can also be prepared like it". Know that the Spirit hidden in the Sulphur, the Arsenick and the animal oil, is named by the philosophers The White Elixir. It is unique, miscible with the volatile substance, from this one we extract the red Elixir; it unites with the melted metals, thus as we have experimented with it, it purifies them. Not only because of the aforementioned properties, but also because there is one common proportion between its elements.

The metals differ between themselves according to the purity or impurity of the first matter, so to speak, of the Sulphur and of the Mercury, and also according to the degree of the fire which produced them.

According to philosophy, the Elixir also is called Medicine, because one assimilates the body of metals in the body of animals. Also we say that there is a hidden Spirit in the Sulphur, the Arsenick and the oil extract of the animal substances. It is that spirit for which we search, with whose aid we will tint all the imperfect bodies to perfection. This Spirit is called Water and mercury by the Philosophers. "The mercury", says Geber, "is a medicine composed of the dry and the humid, the humid and the dry". You understand the succession of operations: extract the earth from the fire, the air from the earth, the water from the air, since the water can resist the fire. It is necessary to mark well these teachings, they are Universal Secrets.

None of the principles which enter into the Work have strength by themselves; for they are linked in the metals, they cannot be perfected, they are not very fixed. Each lacks two substances, one miscible with the metals in fusion, the other fixed which enables it to coagulate and fix. Also Rhases said: "There are four substances which change in season: each one of these is composed of the four elements and takes the name of the dominant element. Their marvelous essence was fixed in one body, and, with this last, one can nourish the other bodies. This essence is composed of water and of air, combined in such a way that the heat liquefies them. Here it is: a marvelous secret. The minerals employed in Alchemy must, in order to serve us, have an action upon the melted bodies. The stones we use are four in number, two tint to white, the two others to red. Also: the white, the red, the Sulphur, the Arsenick and Saturn have only that one same body! But in this single body, what obscurities! And at first it is without action upon the perfect metals".

"In the imperfect bodies, there is an acid water, bitter, harsh, necessary to our Art. As it dissolves and mortifies the bodies, it then revives them and recomposes them. Rhases says in his third letter: Those who search our Enteleche, ask from whence the bitter aqueous fundamental comes. We answer them: from the impurity of the metals. Because the water contained in Gold is sweet, it does not dissolve, on the contrary, it coagulates and fortifies, because it contains neither acidity nor impurity like the imperfect bodies". This is why Geber said: "One calcines and dissolves the gold and silver in vain, because our vinegar takes from the four imperfect bodies; this is the mortifying and dissolving spirit which mixes the tinctures of all the bodies that we employ in the Work. We need nothing but this water, of little importance to us are the other Spirits".

Geber is right; we have not to make a tincture for the fire to adulterate. Actually, on the contrary, it is

necessary that the fire give it excellence and strength in order that it can ally itself with the melted metals. It is necessary that it strengthen, that it fix, that despite the fusion, it rests intimately united with the metal.

I will add that from the four imperfect bodies, one can extract all. As for the manner of preparing the Sulphur, the Arsenick, and the Mercury most highly acclaimed, one can bring it forth here.

Indeed, when in this preparation we heat the spirit of the Sulphur and of the Arsenick, with the acid waters or the oil, for in extracting this volatile essence, the oil or unctuousness, we raise them above that which is superfluous to them; it leaves the volatile force and the oil, these things alone are those which are useful to us; but they are mixed in the acid water which served us in purifying, there is no means of separating these, but at least we are rid of the useless. It is necessary therefore, to find another means to extract from these bodies in order to obtain the water, the oil, and the very subtle spirit of the Sulphur which is the true very active Tincture for which we search. We will work so with the bodies in separating by decomposition or yet by distillation of their natural component parts, and we will arrive thus at the simple parts. Some, ignoring the composition of the Magistery want to work on the Mercury alone, asserting it has one body, one soul, one spirit, and that it is the first matter of gold and silver. It is necessary to respond to them on the truth which several philosophers affirm, that the Work is made up of three things: The Spirit, the Body, and the Soul, extracted from one only. But for the other part, one cannot find in something that which is not there. Now, the Mercury does not have the red tincture, therefore, it alone cannot suffice to form the body of the Sun; it will be impossible for us with only the Mercury to direct the Work to a good end. The Moon alone cannot suffice, meanwhile this body is, so to speak, the foundation of the Work.

In whatever manner that one works and transforms the Mercury, never will it be able to establish a body. They say also: "One finds in the Mercury a red Sulphur, therefore it contains the red tincture". Error! The Sulphur is the father of the metals, one never finds it in the Mercury which is female!

A passive matter cannot fertilize itself. The Mercury contains indeed a Sulphur, but, as we have already said, it is an earthy Sulphur. We remark finally, that the Sulphur cannot support the fusion; therefore, the Elixir cannot be extracted from one thing only.

## **Chapter II**

### **Of the Putrefaction**

Fire produces death and life. A light fire dries the body. Here is the reason: Fire, coming into contact with a body, sets into motion the element similar to itself which exists in this body.

This element is the Natural heat. The former one excites the fiery part of the body in the first place; there is a conjunction and the radical humidity of the body rises to the surface while the fire works on the exterior. Those diverse portions of the body are gone which the radical humidity united, the dead body is dissolved, is resolved, all its parts separated one from the other. The fire works here like a cutting instrument. That which it dries and contracts of itself, it can do only so long as there is a certain predisposition in the body, especially if the body is compact like one element. The last one needs a fixed agglutinate, which will have separated from the body before corruption. All this can be done by the Sun, because it is in one nature hot and humid, through affinity with the other bodies.

### **Chapter III**

#### **Of the Regimen of the Stone**

There are four stages of the Stone: (1) to decompose; (2) to wash; (3) to contract; (4) to fix. In the first stage, one separates the natures because without division, without purification, there cannot be a conjunction. During the second stage, the separate elements are washed, purified, and restored to the simple state. In the third, one changes our Sulphur to the mineral of the Sun, of the moon and of the other metals. In the fourth, all the bodies formerly extracted from our Stone are united, recomposed and fixed so as to rest conjointly henceforth.

There are some who count five stages in the Magistry: (1) to resolve the substance to the first matter; (2) to introduce our earth, the black magnesium, so to speak, as being related to the nature of the Sulphur and the mercury; (3) also to render the Sulphur as close as possible to the mineral matter of the Sun and of the moon; (4) to compose of the several things a white Elixir; (5) to cook perfectly the white Elixir to give it the color of cinnabar, starting there in order to make the red Elixir.

Finally, there are some who count four stages in the work, others three, others only two. These last count thus: (1) setting up the work and purification of the elements; and (2) conjunction.

Mark well that which follows: The substance of the Stone of the Philosophers is common: one finds it everywhere, it is a viscous water like the Mercury that one extracts from the earth. Our viscous water is found everywhere, even in the Latrines, certain philosophers have said. And, several imbeciles take their words literally, searching for it in the excrements!

Nature operates on this matter in raising something from it, its earthy principle, and in uniting something with it, the Sulphur of the Philosophers, which is not the vulgar sulphur, but a transparent Sulphur of red tint. For to speak the truth, it is the Spirit of Roman Vitriol. Prepare it thus: take of Saltpeter and of Roman Vitriol, two pounds of each; pulverize finely. Hence, Aristotle is right when he says that one cannot in any way change the form of the metals, if one does not first reduce them to their first matter. This is easy as one will shortly see. Philosophy says that one cannot go from one extreme to the other without an intermediary. At one extremity of our Philosophical Stone, are two luminaries, gold and silver; at the other extremity, the perfect elixir or tincture, and in the middle, the Philosophical Water of Life, naturally purified, cooked and digested.

All these things are near to perfection and preferable to the more primitive bodies of nature. Likewise, by means of average heat, the ice dissolves into water, for we have formerly had water. Thus, the metals are resolved to their first matter which is our Water of Life. The preparation is indicated in the chapters that follow. By itself alone, it can reduce all the metallic bodies to their first matter.

### **Chapter IV**

#### **Of the Sublimation of the Mercury**

In the name of God, procure yourself a pound of pure mercury issuing from the mine. Of the other portion, take of Roman Vitriol and of common calcined salt, pulverize and mix well. Put these two latest matters into a large glazed earthenware flask and set over a mild fire until the matter begins to melt and flow. Then take your mineral mercury, put it in a flask with a long neck and drop-by-drop, pour it over the vitriol and salt in fusion. Stir with a wooden spatula until the mercury is completely consumed and it leaves no trace. When it has completely disappeared, dry the matter over a gentle fire during the night. The next morning, you will take the well-dried matter and pulverize it finely on a stone. Place the pulverized matter in a sublimating flask called an Aludel, to sublime according to the Art. Place on it the head of the vessel, and close the joints with a philosophical luting, so that the mercury cannot escape. Place the Aludel in a furnace and seal it in so it cannot tilt over but stands straight. Then make a little fire for about four hours to drive away the humidity of the mercury and of the vitriol. After the evaporation of the humidity, increase the fire so that the pure white matter of the mercury separates itself from the impurities; do this for four hours; you will see if it suffices by introducing a wooden rod to the sublimating flask by way of the principle opening, you will lower it just to the matter and determine whether or not the white matter of the mercury is uppermost in the mixture. If it is, raise the baton, close the aperture of the head with a luting so that the mercury cannot escape, and increase the fire in such a way that the white matter of the mercury rises above the faeces in the Aludel. Do this for four hours. Finally, heat with wood in a manner to obtain a blaze: it is necessary that the bottom of the flask and the residue becomes red. Continue thusly until there remains a little of the white substance of the Mercury adherent to the faeces. The force and the violence of the fire will be spent during the separation.

Stop the fire, allow the furnace and the matter to cool overnight. The next morning, return the flask to the furnace, lift the luting with caution in order not to sully the mercury, open the apparatus. If you find a white matter, sublimed, pure, compact, heavy, then you have succeeded. But if the sublimate was spongy, light, porous, collect it and recommence the sublimation on the residue adding now pulverized common salt. Operate in the same flask over the furnace, in the same manner, with the same very high degree of fire. Then open the flask, see if the sublimate is white, compact, dense. Then collect it and put it carefully aside so that it may serve you when you have need to finish the Work. But if again it has not occurred as it should, you will have to sublime it a third time until you obtain it pure, compact, white and heavy.

Notice that by this operation you have raised two impurities from the Mercury. At first you removed from it all its superfluous humidity; in the second, you have rid it of its impure earthy parts which remained in the faeces. Thus, you have now sublimed it to a clear semi-fixed substance.

Put this aside as one has recommended to you.

## **Chapter V**

### **Of the Preparation of the Waters from Which You Will Derive the Water of Life**

Take two pounds of Roman Vitriol, two pounds of Saltpeter, one pound calcined Alum. Crush well, mix perfectly, put it in a glass Alembic. Distill the water according to ordinary procedures, closing the joints well, lest the spirits escape. Begin with a gentle fire, the heat more forcibly; afterwards heat with wood until the apparatus becomes white, so that all the spirits distill. Then, stop the fire. Let the furnace cool. Put this carefully aside, for this is the Solvent of the Moon. Conserve it for the Work; it dissolves the silver and

separates it from the gold. It calcines the Mercury and the crocus of Mars; it gives to the skin of a man, a brown coloration which is hard to get rid of. This is the prime water of the philosophers, it is perfect to the first degree. You will prepare three pounds of the water.

### **Second Water Prepared by Way of Sal Ammoniac ~**

In the name of God, get one pound of the first water and therein dissolve four parts of pure and uncolored Sal Ammoniac. The dissolution done, the water will change color. It has acquired other properties. The prime water was greenish, it dissolved the Moon, it was without action on the Sun; but as soon as one adds to it from the sal ammoniac, it takes on a yellow color. It dissolves gold, mercury and sulphur sublimate, and gives a strong yellow coloration to the skin of a man. Conserve this water preciously, because it will serve us in the work.

### **Third Water Prepared by Means of Mercury Sublimate ~**

Take of the third mercuric water, perfected to the third degree, pellucid; put it to putrefy in the belly of a horse, in a flask with a long neck, clean, well-sealed, for 14 days. Leave it to ferment, the impurities drop to the bottom and the water passes from yellow to red. At this time, you will retrieve the flask and you will put it over the cinders of a very mild fire. Adapt to it the head of the alembic with a recipient. Begin the distillation slowly. That which passes, bit by bit, is our Water of Life. A very clear, pure, heavy, virginal milk, a very sour Vinegar. Continue the fire gently until all the water of life has distilled gradually over. Then, stop the fire, let the furnace cool and conserve with care your distilled water. This is it: Our Water of Life, Vinegar of the Philosophers, Virgin's Milk which reduces the bodies to their first matter, It was given an infinity of names.

Here are the properties of this water: a little bit deposited on a thin plate of hot copper, penetrates it immediately and leaves there a white stain. Thrown over the coals, it emits a smoke. In air it congeals and resembles ice. When one distills this water, all the drops don't pass following the same path, rather, some pass here, others there. It does not work on the metals like strong corrosive water, which dissolves them, but it reduces to Mercury all the bodies that it bathes, just as you will see much later.

After the putrefaction, the distillation, the clarification, it is pure and very perfect. Free from every volatile, superfluous and corrosive principle. It is not a water which consumes, it does not dissolve the bodies but reduces them to Mercury. It owes this property to the original Mercury dissolves and putrefied to the third stage of perfection. It neither contains any faeces nor earthy impurities. The last distillation separated them, the black impurities are resting at the bottom of the alembic. The color of this water is reddish-clue, clear; put it aside. This, it reduces all the calcined and putrefied bodies to their prime matter.

When you want to reduce the calcined bodies with this water, prepare the bodies thusly:

Take some of the body that you will want, Sun or Moon, and file it very fine. Pulverize this well using a stone prepared with common salt. Separate the salt by dissolving it in hot water. The pulverized lime will resettle at the bottom of the liquid. Decant. Dry the lime, soak it three times in oil of Tartar, allowing the lime to absorb all the oil each time. Finally, put the lime in a little flask; pour it over the oil of Tartar, so that the liquid has a depth of two fingers, then close the flask. Put it to putrefy in the belly of a horse for 8 days. Then take the flask, decant the oil and dry the lime. This done, put the lime into an equal amount of our

Water of Life. Close the flask and let it digest over a very mild fire until all the lime be converted into Mercury. Decant, then, the water with caution. Recover the corporeal Mercury; put it in a glass vessel, putrefy it with water and common salt. Dry according to the laws, put it in a fine linen and squeeze out in drops. If it passes in its entirety, it is good. If some portion of the amalgamate body remains, indicating that the dissolution has not been complete, put the residue with a new quantity of the consecrated water. Know that the distillation of the water must be done in a water-bath; for the air and the fire, one will distill over hot cinders. The water must be derived from the humid substance and not otherwise; the air and the fire must be an extract of the dry substance and none other.

## **Chapter VI**

### **Properties of This Mercury**

It is less mobile, it flows less quickly than the other Mercury; it leaves traces of its fixed body in the fire: one drop placed on a thin plate heated to red leaves a residue.

#### **Multiplication of the Philosophical Mercury ~**

When you have your philosophical Mercury, take two portions of it and one portion of the filings mentioned much earlier. Make an amalgamate of these by cooking them together in a flask that has been well sealed and placed over cinders of a temperate fire. The entire will resolve into mercury. You will therefore want to increase this to infinity, because the amount of the volatile always exceeds the amount of the fixed. It increases indefinitely giving to it its proper nature and there is always enough.

Now you know how to prepare the Water of Life, you understand some of the stages and the properties, you understand the putrefaction of the metallic bodies, their reduction to the prime matter, the multiplication of the matter to infinity. I clearly explained to you all that which the Philosophers hid with care.

It is not the vulgar Mercury, it is the first matter of the Philosophers. It is aqueous cold, a humid element; it is a permanent water, it is the spirit of the body, an oily vapor, consecrated Water, strong water, Water of the Sages, Vinegar of the Philosophers, mineral water, Rose of the Celestial Grace; it has many other names besides these and indeed, many they be that are different! However, they all designate one and the same thing which is the Mercury of the Philosophers. It is the focus of Alchemy; alone it can serve to make the tincture, the white and the red, etc.

Take then, in the name of Jesus Christ, our venerable Water of the Philosophers, original Hyle of the Sages; it is the stone that one revealed for you in this treatise. It is the first matter of the perfect body, as you have determined. Put your matter in a furnace, into a clean vessel, clear transparent and round, whose opening you will hermetically seal, so that nothing can escape. Your matter is to be placed on a level bed or surface, slightly hot. You will leave it there for one Philosophical month. Maintain the heat evenly, so that the perspiration of the matter will sublime, until it sweats no longer, that nothing rises or descends, That it begins to putrefy, to suffocate, to coagulate and to fix by maintaining the constancy of the fire. It will not raise more of the exalted, smoky substance, and our Mercury will remain on the bottom, dry, robbed of its humidity, putrefied, coagulated, changed to a black earth, that one calls Head of the Raven, a dry and earthy element.

When you have done this, you will have accomplished the genuine sublimation of the Philosophers, during this you will have examined all the aforementioned stages, to wit: sublimation of the Mercury, distillation, coagulation, fixation, in one only vessel and with one only furnace as was stated.

Indeed when our stone is in its vessel, and it is increase, one says that there is sublimation or ascension. When afterwards it again settles to the bottom, one says that there is distillation or precipitation. Next, when after the distillation and sublimation, our stone begins to putrefy and to coagulate, it is the putrefaction and the coagulation; finally when it calcines and fixes through the loss of its radical, aqueous humidity. It is the calcinations and fixation; all this is done through the single act of heating, in a single furnace, in a single vessel, as was said.

This sublimation constitutes a genuine separation of the elements, according to the Philosophers: "The Work of Our Stone consists only of the Separation and Conjunction of the elements; because in our sublimation, the aqueous, cold and humid element changes to a dry, earthy and hot element". It follows that the separation of the elements of our stone is not vulgar, but philosophical: our single, very perfect sublimation indeed suffices to separate the elements. In our stone there is the form of only two elements, the water and the earth, which potentially contain the other two. The Earth potentially (or virtually) contains the Fire, because of its dryness; the Water potentially contains the Air because of its humidity. It is thus quite evident that although our stone has only the form of two elements, it potentially contains all four.

Also a Philosopher said of it: "There is not a separation of the four elements in our stone like the imbeciles think. Our nature contains a very hidden secret; thus one sees the power and the strength, the earth and the water. It contains two other elements, the air and the fire. However, these are neither visible nor tangible, one cannot represent them, one ignores their influence, they disclose nothing which does not manifest in the two other elements, earth and water, when the fire changes the colors during the digestion".

Behold that by the grace of God, you have the second component of the Philosophical stone; which is the Black Earth, the Head of a Crow, mother, heart, origin of the other colors. From this earth, as the one body, all the rest take their birth. This dry earthy element received in the books of the Philosophers, Nummus, black sulfur, male, husband, etc. Despite this endless variety of names, it is the single and the same thing always, derived from a single matter. Because the Philosophical sublimation resulted in a deprivation of humidity, the volatile became fixed, the soft became hard and the aqueous became earthy, according to Geber.

This is the metamorphosis of the nature, the changing of the water to fire, according to The Turba. It is also the changing of the cold and humid constitutions to bilious, dry constitutions, according to the doctors. Aristotle says that the spirit took a body, and Alphidius says that the liquid became viscous. The hidden became manifest, says Rudianus in the Book of the Three Words. One now understands the Philosophers when they say: "Our great Work is not other than a permutation of nature, an evolution of the elements". It is quite evident that by this deprivation of humidity, we render the stone dry, the volatile becomes fixed, the spirit becomes corporeal, the liquid becomes solid, the fire changes to water, the air to earth. We have thus changed the true natures following a certain order; we have permuted their natures. That God be eternally blessed! Amen.

Let us now pass, with the permission of God, to the second operation which is the whitening of our pure

earth. Take then, two parts of the fixed earth or Head of a Raven: digest it subtly with precaution in an excessively clean mortar. Add to it one part of the Philosophical water that you know of (That which you have put aside). Unite these by imbibing the dry earth little by little into the water until its thirst is quenched. Digest and mix well enough that the union of the body, of the soul and of the water be perfect and intimate. This done, you will put all of it in a hermetically sealed flask so that nothing will escape. Place the flask over a little warm bed, always hot and kept level, so that in sweating, its entrails are rid of the liquid which it drank. You will leave it there eight days until the earth whitens somewhat.

You will then take the Stone, you will pulverize it, soak it again in the virginal milk, stirring, until its thirst is quenched. Put it again in the flask over its warm little bed so that it dries like that above. You will repeat this operation four times following the same order: The soaking of the earth by water until perfect union: The soaking of the earth by water until perfect union, dessication and calcinations. You will then have sufficiently purified the Head of the Raven, the black and foetid earth, you have brought it to whiteness by the strength of the fire, of the heat, and the whitened water. Gather your white earth and put it carefully aside. This is very precious because it is the foliated white earth, white Sulphur, white Magnesia, etc. Morien speaks of it when he says: "Put this earth with its water to putrefy so that it purifies, and with the aid of God you will finish the Magistry". Hermes says the same as Azoth, wash the Laton and raise it from all its impurities.

In this latest operation, we produced a genuine conjunction of the elements, because the water united with the earth, the air with the fire. It is this union of the man with the woman, of the male with the female, of the gold with the silver, of the dry and the impure celestial water.

There was also a resurrection of dead bodies. This is why the Philosophers said: "Those who do not know how to kill and how to revive, abandon the Art". And elsewhere: "Those who know how to kill and how to revive, will profit from our science. This one will be the Prince of the Art who will do these two things". Another Philosopher said: "Our dry Earth does not bear any fruit if it is not profoundly soaked in its Rain Water. Our dry Earth has a great thirst, when it begins to drink, it drinks down to the dregs". Another said: "Our Earth drinks the fertile water that it awaited, it quenches its thirst, then it produces hundreds of fruits". One finds many similar passages in the books of the Philosophers, but they are in the form of parables, so that the evil cannot understand them. By the Grace of God, you now possess our white foliated Earth, all ready to undergo the fermentation, which will give it breath. Also the Philosophers said: "Whiten the black Earth before uniting it with the ferment". Another said: "Sow your gold in the white foliated Earth, and it will give you fruit an hundredfold". Glory to God. Amen.

We pass to the third operation which is the fermentation of the white Earth. It is necessary to animate and revive the dead body, in order to multiply its strength to infinity, and to cause it to pass to the state of the perfect white elixir which changes the Mercury to the genuine and perfect Moon. Note that the ferment cannot penetrate the dead body, that by the intermediary of the water the marriage is made and the bond set between the white earth and the ferment. This is why in all fermentation, it is necessary to note the weight of each thing. If then you want to set the white Earth aside to ferment in order to change it to the white Elixir containing an excess of the tincture, it is necessary to take three parts of the white Earth or dead foliated Body, two parts of the Water of Life, that you put in reserve and one-half of the ferment.

Prepare the ferment in such a way that it is reduced to a white lime, bound and fixed, if you want to make the white elixir. If you want to make the red Elixir, condense the lime of the very yellow gold, prepared

according to the art. There are no other ferments like these here. The ferment of silver is silver, the ferment of gold is gold, therefore don't look elsewhere! The reason for this is that the two bodies are luminous, they contain the brilliant lights which communicate to the other bodies true redness and whiteness. They are of one nature, similar to that of sulphur, the purest of the matter of this type of stone. Extract then, each kind from its own kind, each family from its own family. The work of the white has as a goal, to whiten; the work of the red, to redden. Above all, do not mix the two Works, otherwise nothing will work well.

All the Philosophers say that our stone is composed of three things: The Body, the Spirit and the Soul. Now the white Earth is the Body, the ferment is the Soul, which gives it its life, the intermediary water is the Spirit. Reunite these three things in one by marriage, digesting them well over an appropriate stone, so as to unite them in their smallest particles, to form from it a confused chaos. When you have made a single body of all, put it carefully in a special flask which you will place over its hot bed, so that the mixture coagulates, fixes and becomes white. You will take the blessed white stone, you will pulverize it finely over a very clean stone, soak it with a third of its weight of water to slake its thirst. Then return it to the clear and clean flask placed over its soft and hot bed so that it commences to sweat and to yield its water, and finally you will leave its entrails to dry. Repeat often until you have prepared by this procedure our very excellent fixed white Stone, which penetrates the tiniest part of the bodies very rapidly, flowing like the fixed water when one puts it over the fire, changing the imperfect bodies to genuine silver, quite comparable to natural silver. Note that if you often repeat all the operations in the same order: to dissolve, to coagulate, to pulverize, to digest, your medicine will be so much the better, its excellence increasing more and more. Furthermore, you will work your Stone in order to increase the virtue, and more, you will have the yield when you make the projection upon imperfect bodies in a way so that after one operation, one part of the Elixir transmutes one hundred parts of whatever body to the Moon, after two operations one thousand, after three, ten thousand, after four, one hundred thousand, and so on, ad infinitum. Also the adepts praise all the great maxims of the Philosophers about the perseverance to repeat this operation. If one imbibition was sufficient, they would not have had so much to say upon the subject. Grace be given unto God. Amen.

If you desire to change the glorious stone, this white King which transmutes and tints the Mercury and all the imperfect bodies into the true Moon, if you desire, I say, to change it to the red stone which tints and transmutes the Mercury, the Moon and the other metals to the true Sun, operate thusly: Take the White Stone and divide it into two parts; you will raise one part to the state of the white Elixir, as has been said much earlier (of the kind of which you will have an indefinite amount). Put the other part in a new bed of the Philosophers, clean, tidy, transparent, spherical and place it in the furnace for digestion. Increase the fire until by its force and strength the matter is changed to a very red stone, that the Philosophers call Blood, purple, red coral or red sulphur. When you see this color so that there is as bright as that of the dry calcined crocus, then take the King joyously, put it aside very carefully. If you want to change it to the red Elixir, a tincture of great strength, transmuting and tingeing the Mercury, the Moon and all other imperfect metal bodies, to the very genuine Sun, bring the ferment three parts with one and a half parts of very pure gold, to the state of perfection and very yellow, and two parts of solidified water. Make of it a perfect mixture according to the rules of Art, until into longer is possible to distinguish the components. Put it again in a flask over a matured fire in order to perfect it. As soon as the true Stone appears blood red, you will gradually add the sold Water.

Slowly increase the fire of digestion. By repeating this operation, you will increase its perfection. It is necessary to add, each time, the solid Water (that you preserved), which draws to its nature; it multiplies its strength to infinity, without changing anything of its essence. One part of the perfect Elixir of the first

degree, projected over one hundred parts of the Mercury (washed with some vinegar and some salt as you should know), placed in a crucible over a small fire, until smoke appears, immediately transmutes them to the genuine Sun, better than the natural. The same in replacing Mercury by the Moon.

For each degree of perfection, from most of the Elixir, it is the same thing as that for the white Elixir, until it tints it finally to the Sun of the infinite quantities of the Mercury and the Moon. You now possess a precious secret, an infinite treasure. This is why the Philosophers say: "Our stone has three colors; it is black at the outset, white in the middle, the end". A Philosopher said: "The heat works first on the humidity to produce the blackness, its action on the dry produces the white and on the white produces the red. Thus the whiteness is nothing other than the complete absence of blackness. The white skillfully condensed by the force of the fire produces the red". --- "All you seekers who work the Art", said another sage, "When you see the white appear in the vessel, know that the red is hidden in the white. It is necessary that you extract it from it and for this to heat forcefully until the appearance of the red".

*Finis.*

## **Fama Fraternitatis**

### **To the Wise and Understanding Reader.**

Wisdom (saith Solomon) is to a man an infinite Treasure, for she is the Breath of the Power of God, and a pure Influence that floweth from the Glory of the Almighty; she is the Brightness of Eternal Light, and an undefiled Mirror of the Majesty of God, and an Image of his Goodness; she teacheth us Soberness and Prudence, Righteousness and Strength; she understands the Subtilty of words, and Solution of dark sentences; she foreknoweth Signs and Wonders, and what shall happen in time to come; with this Treasure was our first Father Adam fully endued: Hence it doth appear, that after God had brought before him all the Creatures of the Field, and the Fowls under Heaven, he gave to every one of them their proper names, according to their nature.

Although now through the sorrowful fall into sin this excellent Jewel Wisdom hath been lost, and meer Darkness and Ignorance is come into the World, yet notwithstanding hath the Lord God sometimes hitherto bestowed, and made manifest the same, to some of his Friends: For the wise King Solomon doth testifie of himself, that he upon earnest prayer and desire did get and obtain such Wisdom of God, that thereby he knew how the World was created, thereby he understood the Nature of the Elements, also the time, beginning, middle and end, the increase and decrease, the change of times through the whole Year, the Revolution of the Year, and Ordinance of the Stars; he understood also the properties of tame and wilde Beasts, the cause of the raining of the Winds, and minds and intents of men, all sorts and natures of Plants, vertues of Roots, and others, was not unknown to him. Now I do not think that there can be found any one who would not wish and desire with all his heart to be a Partaker of this noble Treasure; but seeing the same Felicity can happen to none, except God himself give Wisdom, and send his holy Spirit from above, we have therefore set forth in print this little Treatise, to wit, Famam & Confessionem, of the Laudable Fraternity of the Rosie Cross, to be read by every one, because in them is clearly shewn and discovered, what concerning it the World hath to expect.

Although these things may seem somewhat strange, and many may esteem it to be but a Philosophical shew, and no true History, which is published and spoken of the Fraternity of the Rosie Cross; it shall here sufficiently appear by our Confession, that there is more in recessu then may be imagined; and it shall be easily understood, and observed by every one (if he be not altogether voyd of understanding) what now adays, and at these times, is meant thereby.

Those who are true Disciples of Wisdom, and true Followers of the Spherical Art, will consider better of these things, and have them in greater estimation, as also judg far otherwise of them, as hath been done by some principal Persons, but especially of Adam Haselmeyer, Notarius Publicus to the Arch Duke Maximilian, who likewise hath made an Extract ex scriptis Theologicis Theophrasti, and written a Treatise under the Title of Jesuiter, wherein he willeth, that every Christian should be a true Jesuit, that is, to walk, live, be, and remain in Jesus: He was but ill rewarded of the Jesuits, because in his answer written upon the Famam, he did name those of the Fraternity of the Rosie Cross, The highly illuminated men, and undeceiving Jesuits; for they not able to brook this, layd hands on him, and put him into the Galleis, for which they likewise have to expect their reward.

Blessed Aurora will now henceforth begin to appear, who (after the passing away of the dark Night of

Saturn) with her Brightness altogether extinguisheth the shining of the Moon, or the small Sparks of Heavenly Wisdom, which yet remaineth with men, and is a Forerunner of pleasant Phebus, who with his clear and fiery glistening Beams brings forth that blessed Day, long wished for, of many true-hearted; by which Day-light then shall truly be known, and shall be seen all heavenly Treasures of godly Wisdom, as also the Secrets of all hidden and invisible things in the World, according to the Doctrine of our Forefathers, and ancient Wisemen.

This will be the right kingly Ruby, and most excellent shining Carbuncle, of the which it is said, That he doth shine and give light in darkness, and to be a perfect Medicine of all imperfect Bodies, and to change them into the best Gold, and to cure all Diseases of Men, easing them of all pains and miseries.

Be therefore, gentle Reader, admonished, that with me you do earnestly pray to God, that it please him to open the hearts and ears of all ill hearing people, and to grant unto them his blessing, that they may be able to know him in his Omnipotency, with admiring contemplation of Nature, to his honour and praise, and to the love, help, comfort and strengthening of our Neighbors, and to the restoring of all the diseased.

### **Fama Fraternitatis**

#### **Or, A Discovery of the Fraternity of the most laudable Order of the Rosy Cross.**

Seeing the only Wise and Merciful God in these latter days hath poured out so richly his mercy and goodness to Mankind, wherby we do attain more and more to the perfect knowledg of his Son Jesus Christ and Nature, that justly we may boast of the happy time, wherein there is not only discovered unto us the half part of the World, which was heretofore unknown & hidden, but he hath also made manifest unto us many wonderful, and never-heretofore see, Works and Creatures of Nature, and moreover hath raised men, indued with great Wisdom, which might partly renew and reduce all Arts (in this our Age spotted and imperfect) to perfection; so that finally Man might thereby understand his own Nobleness and Worth, and why he is called Microcosmus, and how far his knowledg extendeth in Nature.

Although the rude World herewith will be but little pleased, but rather smile and scoff thereat; also the Pride and Covetousness of the Learned is so great, it will not suffer them to agree together; but were they united, they might out of all those things which in this our Age God doth so richly bestow upon us, collect *Librum Naturae*, or a perfect Method of all Arts: but such is their opposition, that they still keep, and are loth to leave the old course, esteeming Porphyry, Aristotle, and Galen, yea and that which hath but a meer shew of learning, more then the clear and manifested Light and Truth; who if they were now living, with much joy would leave their erroneous Doctrines. But here is too great weaknesses for such a great Work: And although in Theologie, Physic, and the Mathematic, the Truth doth oppose it self; nevertheless the old Enemy by his subtilty and craft doth shew himself in hindering every good purpose by his Instruments and contentious wavering people. To such an intent of a general Reformation, the most godly and highly illuminated Father, our Brother, C.R. a German, the chief and original of our Fraternity, hath much and long time laboured, who by reason of his poverty (although descended of Noble Parents) in the fifth year of his age was placed in a Cloyster, where he had learned indifferently the Greek and Latin Tongues, who (upon his earnest desire and request) being yet in his growing years, was associated to a Brother, P.A.L. who had determined to go to the Holy Land.

Although this Brother dyed in Ciprus, and so never came to Jerusalem, yet our Brother C.R. did not return, but shipped himself over, and went to Damasco, minding from thence to go to Jerusalem; but by reason of the feebleness of his body he remained still there, and by his skill in Physick he obtained much favour with the Turks: In the mean time he became by chance acquainted with the Wise men of Damasco in Arabia, and beheld what great Wonders they wrought, and how Nature was discovered unto them; hereby was that high and noble Spirit of Brother C.R. so stired up, that Jerusalem was not so much now in his mind as Damasco; also he could not bridle his desires any longer, but made a bargain with the Arabians, that they should carry him for a certain sum of money to Damasco; he was but of the age of sixteen years when he came thither, yet of a strong Dutch constitution; there the Wise received him (as he himself witnesseth) not as a stranger, but as one whom they had long expected, they called him by his name, and shewed him other secrets out of his Cloyster, whereat he could not but mightily wonder: He learned there better the Arabian Tongue; so that the year following he translated the Book M. into good Latin, which he afterwards brought with him. This is the place where he did learn his Physick, and his Mathematicks, whereof the World hath just cause to rejoyce, if there were more Love, and less Envy. After three years he returned again with good consent, shipped himself over Sinus Arabicus into Egypt, where he remained not long, but only took better notice there of the Plants and Creatures; he sailed over the whole Mediterranean Sea for to come unto Fez, where the Arabians had directed him. And it is a great shame unto us, that wise men, so far remote th'one from th'other, should not only be of one opinion, hating all contentious Writings, but also be so willing and ready under the seal of secrecy to impart their secrets to others.

Every year the Arabians and Affricans do send one to another, inquiring one of another out of their Arts, if happily they had found out some better things, or if Experience had weakened their Reasons. Yearly there came something to light, whereby the Mathematica, Physic and Magic (for in those are they of Fez most skilful) were amended; as there is now adays in Germany no want of learned Men, Magicians, Cabalists, Physicians, and Philosophers, were there but more love and kindness among them, or that the most part of them would not keep their secrets close only to themselves. At Fez he did get acquaintance with those which are commonly called the Elementary Inhabitants, who revealed unto him many of their secrets: As we Germans likewise might gather together many things, if there were the like unity, and desire of searching out of secrets amongst us.

Of these of Fez he often did confess, that their Magia was not altogether pure, and also that their Cabala was defiled with their Religion; but notwithstanding he knew how to make good use of the same, and found still more better grounds of his Faith, altogether agreeable with the Harmony of the whole World, and wonderfully impressed in all Periods of times, and thence proceedeth that fair Concord, that as in every several kernel is contained a whole good tree or fruit, so likewise is included in the little body of Man the whole great World, whose Religion, policy, health, members, nature, language, words and works, are agreeing, sympathizing, and in equal tune and melody with God, Heaven and Earth; and that which is disagreeing with them, is error, falsehood and of the Devil, who alone is the first, middle, and last cause of strife, blindness, and darkness in the World: Also, might one examine all and several persons upon the Earth, he should find that which is good and right, is always agreeing with it self; but all the rest is spotted with a thousand erroneous conceits.

After two years Brother R.C. departed the City Fez, and sailed with many costly things into Spain, hoping well, he himself had so well and so profitably spent his time in his travel, that the learned in Europe would highly rejoyce with him, and begin to rule, and order all their Studies, according to those sound and sure Foundations. He therefore conferred with the Learned in Spain, shewing unto them the Errors of our Arts,

and how they might be corrected, and from whence they should gather the true Inditia of the Times to come, and wherein they ought to agree with those things that are past; also how the faults of the Church and the whole *Philosophia Moralis* was to be amended: He shewed them new Growths, new Fruits, and Beasts, which did concord with old Philosophy, and prescribed them new *Axiomata*, whereby all things might fully be restored: But it was to them a laughing matter; and being a new thing unto them, they feared that their great Name should be lessened, if they should now again begin to learn and acknowledg their many years Errors, to which they were accustomed, and wherewith they had gained them enough: Who so loveth unquietness, let him be reformed.

The same Song was also sang to him by other Nations, the which moved him the more (because it happened to him contrary to his expectation,) being then ready bountifully to impart all his Arts and Secrets to the Learned, if they would have but undertaken to write the true and infallible *Axiomata*, out of all Faculties, Sciences and Arts, and whole Nature, as that which he knew would direct them, like a Globe, or Circle, to the onely middle Point, and Centrum, and (as it is usual among the Arabians) it should onely serve to the wise and learned for a Rule, that also there might be a Society in Europe, which might have Gold, Silver, and precious Stones, sufficient for to bestow them on Kings, for their necessary uses, and lawful purposes: with which such as be Governors might be brought up, for to learn all that which God hath suffered Man to know, and thereby to be enabled in all times of need to give their counsel unto those that seek it, like the Heathen Oracles: Verily we must confess that the world in those days was already big with those great Commotions, laboring to be delivered of them; and did bring forth painful, worthy men, who brake with all force through Darkness and Barbarism, and left us who succeeded to follow them: and assuredly they have been the uppermost point in *Trygono igneo*, whose flame now should be more and more brighter, and shall undoubtedly give to the World the last Light.

Such a one likewise hath Theophrastus been in Vocation and Callings, although he was none of our Fraternity, yet nevertheless hath he diligently read over the Book M: whereby his sharp ingenium was exalted; but this man was also hindered in his course by the multitude of the learned and wise-seeming men, that he was never able peaceably to confer with others of his Knowledg and Understanding he had of Nature. And therefore in his writing he rather mocked these busie bodies, and doth not shew them altogether what he was: yet nevertheless there is found with him well grounded the aforementioned Harmonia, which without doubt he had imparted to the Learned, if he had not found them rather worthy of subtil vexation, then to be instructed in greater Arts and Sciences; he then with a free and careless life lost his time, and left unto the World their foolish pleasures.

But that we do not forget our loving Father, Brother C.R. he after many painful Travels, and his fruitless true Instructions, returned again into Germany, the which he (by reason of the alterations which were shortly to come, and of the strange and dangerous contentions) heartily loved: There, although he could have bragged with his Art, but specially of the transmutations of Metals; yet did he esteem more Heaven, and the Citizens thereof, Man, then all vain glory and pomp.

Nevertheless he builded a fitting and neat inhabitation, in the which he ruminated his Voyage, and Philosophy, and reduced them together in a true Memorial. In this house he spent a great time in the Mathematicks, and made many fine Instruments, *ex omnibus hujus artis partibus*, whereof there is but little remaining to us, as hereafter you shall understand. After five years came again into his mind the wished for Reformation; and in regard he doubted of the ayd and help of others, although he himself was painful, lusty, and unwearisom, he undertook, with some few adjoynd with him, to attempt the same: wherefore he

desired to that end, to have out of his first Cloyster (to the which he bare a great affection) three of his Brethren, Brother G.V. Brother J.A. and Brother J.O. who besides that, they had some more knowledg in the Arts, then at that time many others had, he did binde those three unto himself, to be faithful, diligent, and secret; as also to commit carefully to writing, all that which he should direct and instruct them in, to the end that those which were to come, and through especial Revelation should be received into this Fraternity, might not be deceived of the least sillable and word.

After this manner began the Fraternity of the Rosie Cross; first, by four persons onely, and by them was made the Magical Language and writing, with a large Dictionary, which we yet dayly use to Gods praise and glory, and do finde great wisdom therein; they made also the first part of the Book M: but in respect that the labor was too heavy, and the unspeakable concourse of the sick hindred them, and also whilst his new building (called Sancti spiritus) was now finished, they concluded to draw and receive yet others more into their Fraternity; to this end was chosen brother R.C. his deceased fathers brothers son, brother B. a skilful Painter, G. and P.D. their Secretary, all Germaines except J.A. so in all they were eight in number, all batchelors and of vowed virginity, by those was collected a book or volumn of all that which man can desire, wish, or hope for.

Although we do now freely confess, that the World is much amended within an hundred years, yet we are assured, that our Axiomata shall unmovably remain unto the Worlds End, and also the world in her highest and last Age shall not attain to see any thing else; for our Rota takes her beginning from that day when God spake Fiat, and shall end when he shall speak Pereat; yet Gods Clock striketh every minute, where ours scarce striketh perfect hours. We also stedfastly beleeeve, that if our Brethren and Fathers had lived in this our present and clear light, they would more roughly have handled the Pope, Mahomet, Scribes, Artists, and Sophisters, and had shewed themselves more helpful, not simply with sighs, and wishing of their end and consummation.

When now these eight Brethren had disposed and ordered all things in such manner, as there was not now need of any great labour, and also that every one was sufficiently instructed, and able perfectly to discourse of secret and manifest Philosophy, they would not remain any longer together, but as in the beginning they had agreed, they separated themselves into several Countries, because that not only their Axiomata might in secret be more profoundly examined by the learned, but that they themselves, if in some Country or other they observed anything, or perceived some Error, they might inform one another of it.

Their agreement was this: First, That none of them should profess any other thing, then to cure the sick, and that gratis. 2. None of the Posterity should be constrained to wear one certain kind of habit, but therein to follow the custom of the Country. 3. That every year upon the day C. they should meet together at the house S. Spiritus, or to write the cause of his absence. 4. Every Brother should look out for a worthy person, who after his disease might succeed him. 5. The word C.R. should be their Seal, Mark, and Character. 6. The Fraternity should remain secret one hundred years. These six Articles they bound themselves one to another to keep; and five of the Brethren departed, only the Brethren B. and D. remained with the Father Fra: R.C. a whole year; when these likewise departed, then remained by him his Cousen and Brother J.O. so that he hath all the days of his life with him two of his Brethren. And although that as yet the Church was not cleansed, nevertheless we know that they did think of her, and with what longing desire they looked for: Every year they assembled together with joy, and made a full resolution of that which they had done; there must certainly have been great pleasure, to hear truly and without invention related and rehearsed all the Wonders which God hath poured out here and there through the World. Every

one may hold it out for certain, that such persons as were sent, and joined together by God, and the Heavens, and chosen out of the wisest of men, as have lived in many Ages, did live together above all others in highest Unity, greatest Secrecy, and most kindness one towards another.

After such a most laudable sort they did spend their lives; and although they were free from all diseases and pain, yet notwithstanding they could not live and pass their time appointed of God. The first of this Fraternity which dyed, and that in England, was J.O. as Brother C. long before had foretold him; he was very expert, and well learned in Cabala, as his Book called H. witnesseth: In England he is much spoken of, and chiefly because he cured a young Earl of Norfolk of the Leprosie. They had concluded, that as much as possibly could be their burial place should be kept secret, as at this day it is not known unto us what is become of some of them, yet every ones place was supplied with a fit successor; but this we wil confesse publickly by these presents to the honour of God, That what secret soever we have learned out of the book M. (although before our eyes we behold the image and pattern of all the world) yet are there not shewn unto us our misfortunes, nor hour of death, the which only is known to God himself, who thereby would have us keep in a continual readiness; but hereof more in our Confession, where we do set down 37 Reasons wherefore we now do make known our Fraternity, and proffer such high Mysteries freely, and without constraint and reward: also we do promise more gold then both the Indies bring to the King of Spain; for Europe is with child and will bring forth a strong child, who shall stand in need of a great godfathers gift.

After the death of I.O. Brother R.C. rested not, but as soon as he could, called the rest together, (and as we suppose) then his grave was made; although hitherto we (who were the latest) did not know when our loving father R.C. died, and had no more but the bare names of the beginners, and all their successors to us; yet there came into our memory, a secret, which through dark and hidden words, and speeches of the 100 years, brother A. the successor of D. (who was of the last and second row and succession), and had lived amongst many of us,) did impart unto us of the third row and succession; otherwise we must confess, that after the death of the said A. none of us had in any manner known anything of Brother R.C. and of his first fellow-brethren, then that which was extant of them in our Philosophical Bibliotheca, amongst which our Axiomata was held for the chiefest Rota Mundi, for the most artificial, and Protheus the most profitable. Likewise we do not certainly know if these of the second row have been of the like wisdom as the first, and if they were admitted to all things. It shall be declared hereafter to the gentle Reader, not onely what we have heard of the burial of R.C. but also made manifest publickly by the foresight, sufferance and commandment of God, whom we most faithfully obey, that if we shall be answered discreetly and Christian-like, we will not be afraid to set forth publickly in Print, our names, and sirnames, our meetings, or any thing else that may be required at our hands.

Now the true and fundamental relation of the finding out of the high illuminated man of God, Fra: C.R.C. is this; After that A. in Gallia Narbonensi was deceased, then succeeded in his place, our loving Brother N.N. this man after he had repaired unto us to take the solemn oath of fidelity and scerecy, he informed us bona fide, That A. had comforted him in telling him, that this Fraternity should ere long not remain so hidden, but should be to all the whole German Nation helpful, needful, and commendable; of the which he was not in any wise in his estate ashamed of. The year following after he had performed his School right, and was minded now to travel, being for that purpose sufficiently provided with Fortunatus purse, he thought (he being a good Architect) to alter something of his building, and to make it more fit: in such renewing he lighted upon the memorial Table which was cast of brasse, and containeth all the names of the brethren, with some few other things; this he would transfer in another more fitting vault: for where or when Fra:

R.C. died, or in what country he was buried, was by our predecessors concealed and unknown unto us. In this Table stuck a great naile somewhat strong, so that when he was with force drawn out, he took with him an indifferent big stone out of the thin wall, or plaistering of the hidden door, and so unlooked for uncovered the door; wherefore we did with joy and longing throw down the rest of the wall, and cleared the door, upon which that was written in great letters, Post 120 annos patebo, with the year of the Lord under it: therefore we gave God thanks and let it rest that same night, because first we would overlook our Rotam; but we refer our selves again to the confession, for what we here publish is done for the help of those that are worthy, but to the unworthy (God willing) it will be small profit: For like as our door was after so many years wonderfully discovered, also there shall be opened a door to Europe (when the wall is removed) which already doth begin to appear, and with great desire is expected of many.

In the morning following we opened the door, and there appeared to our sight a Vault of seven sides and corners, every side five foor broad, and the height of eight foot; Although the Sun never shined in this Vault, nevertheless it was enlightened with another sun, which had learned this from the Sun, and was scituated in the upper part in the Center of the sieling; in the midst, in stead of a Tomb-stone, was a round Altar covered over with a plate of brass, and thereon this engraven:

A.C. R.C. Hoc universi compendium unius mihi sepulchrum feci.

Round about the first Circle or Brim stood,

Jesus mihi omnia.

In the middle were four figures, inclosed in circles, whose circumscription was,

1. Nequaquam vacuum.
2. Legis Jugum.
3. Libertas Evangelij.
4. Dei gloria intacta.

This is all clear and bright, as also the seventh side and the two Heptagoni: so we kneeled altogether down, and gave thanks to the sole wise, sole mighty, and sole eternal God, who hath taught us more then all mens wit could have found out, praised be his holy name. This Vault we parted in three parts, the upper part or sieling, the wall or side, the gound or floor.

Of the upper part you shall understand no more of it at this time, but that it was divided according to the seven sides in the triangle, which was in the bright center; but what therein is contained, you shall God willing (that are desirous of our society) behold the same with your own eys; but every side or wall is parted into ten squares, every one with their several figures and sentences, as they are truly shewed, and set forth Concentratum here in our book.

The bottom again is parted in the triangle, but because therein is discribed the power and rule of the inferior Governors, we leave to manifest the same, for fear of the abuse by the evil and ungodly world. But those that are provided and stored with the heavenly Antidote, they do without fear or hurt, tread on, and bruise the head of the old and evil serpent, which this our age is well fitted for: every side or wall had a door for a chest, wherein there lay diverse things, especially all our books, which otherwise we had, besides the

Vocabular of Theoph: Par. Ho. and these which daily unfalsifieth we do participate. Herein also we found his Itinerarium, and vitam, whence this relation for the most part is taken. In another chest were looking-glasses of divers virtues, as also in other places were little bells, burning lamps, & chiefly wonderful artificial Songs; generally al done to that end, that if it should happen after many hundred years, the Order or Fraternity should come to nothing, they might by this onely Vault be restored again.

Now as yet we had not seen the dead body of our careful and wise father, we therefore removed the Altar aside, there we lifted up a strong plate of brass, and found a fair and worthy body, whole and unconsumed, as the same is here lively counterfeited, with all the Ornaments and Attires; in his hand he held a parchment book, called I. the which next to the Bible, is our greatest treasure, which ought to be delivered to the censure of the world. At the end of this book standeth this following Elogium.

Granum pectori Jesu insitum.

C. Ros. C. ex nobili atque splendida Germaniae R.C. familia oriundus, vir sui seculi divinis revelationibus subtilissimis imaginationibus, indefessis laboribus ad coelestia, atque humana mysteria ; arcanave admissus postquam suam (quam Arabico, & Africano itineribus Collegerat) plusquam regiam, atque imperatoriam Gazam suo seculo nondum convenientem, posteritati eruendam custo divisset et jam suarum Artium, ut et nominis, fides acconjunctissimos herides instituisset, mundum minutum omnibus motibus magno illi respondentem fabricasset hocque tandem preteritarum, praesentium, et futurarum, rerum compendio extracto, centenario major non morbo (quem ipse nunquam corpore expertus erat, nunquam alios infestare sinebat) ullo pellente sed spiritu Dei evocante, illuminatam animam (inter Fratrum amplexus et ultima oscula) fidelissimo creatori Deo reddidisset, Pater dilectissimus, Fra: suavissimus, praeceptor fidelissimus amicus integerimus, a suis ad 120 annos hic absconditus est.

Underneath they had subscribed themselves,

1. Fra: I.A. Fr.C.H. electione Fraternitatis caput.
2. Fr: G.V. M.P.C.
3. Fra: R.C. Iunior haeres S. spiritus.
4. Fra: B.M. P.A. Pictor et Architectus.
5. Fr: G.G. M.P.I. Cabalista.

Secundi Circuli.

1. Fra: P.A. Successor, Fr: I.O. Mathematicus.
2. Fra: A. Successor, Fra. P.D.
3. Fra: R. Successor patris C.R.C. cum Christo triumphant.

At the end was written :-

Ex Deo Nascimur, in Jesu morimur, per spiritum sanctum reviviscimus.

At that time was already dead Brother I.O. and Fra: D. but their burial place where is it to be found? we doubt not but our Fra: Senior hath the same, and some especial thing layd in Earth, and perhaps likewise hidden: we also hope that this our Example will stir up others more diligently to enquire after their names

(whom we have therefore published) and to search for the place of their burial; for the most part of them, by reason of their practice and physick, are yet known, and praised among very old folks; so might perhaps our Gaza be enlarged, or at least be better cleared.

Concerning Minitum Mundum, we found it kept in another little Altar, truly more finer than can be imagined by any understanding man; but we will leave him undescribed, untill we shall truly be answered upon this our true hearted Famam; and so we have covered it again with the plates, and set the altar thereon, shut the door, and made it sure, with all our seals; besides by instruction and command of our Rota, there are come to sight some books, among which is contained M. (which were made in stead of household care by the praise-worthy M.P.) Finally we departed the one from the other, and left the natural heirs in possession of our Jewels. And so we do expect the answer and judgment of the learned, or unlearned.

Howbeit we know after a time there will now be a general reformation, both of divine and humane things, according to our desire, and the expectation of others: for it's fitting, that before the rising of the Sun, there should appear and break forth Aurora, or some clearness, or divine light in the sky; and so in the mean time some few, which shall give their names, may joyn together, thereby to increase the number and respect of our Fraternity, and make a happy and wished for beginning of our Philosophical Canons, prescribed to us by our brother R.C. and be partakers with us of our treasures (which never can fail or be wasted) in all humility, and love to be eased of this worlds labor, and not walk so blindly in the knowledge of the wonderful works of God.

But that also every Christian may know of what Religion and belief we are, we confess to have the knowledge of Jesus Christ (as the same now in these last days, and chiefly in Germany, most clear and pure is professed, and is now adays cleansed and voyd of all swerving people, Hereticks, and false Prophets,) in certain and noted Countries maintained, defended and propagated: Also we use two Sacraments, as they are instituted with all Forms and Ceremonies of the first renewed Church. In Politia we acknowledge the Roman Empire and Quartam Monarchiam for our Christian head; albeit we know what alterations be at hand, and would fain impart the same with all our hearts, to other godly learned men; notwithstanding our hand-writing which is in our hands, no man (except God alone) can make it common, nor any unworthy person is able to bereave us of it. But we shall help with secret aid this so good a cause, as God shall permit or hinder us: For our God is not blinde, as the Heathens Fortuna, but is the Churches Ornament, and the honor of the Temple. Our Philosophy also is not a new Invention, but as Adam after his fall hath received it, and as Moses and Solomon used it: also she ought not much to be doubted of, or contradicted by other opinions, or meanings; but seeing the truth is peaceable, brief, and always like herself in all things, and especially accorded by with Jesus in omni parte and all members. And as he is the true Image of the Father, so is she his Image; It shall not be said, this is true according to Philosophy, but true according to Theologie; And wherein Plato, Aristotle, Pythagoras and others did hit the mark, and wherein Enoch, Abraham, Moses, Solomon did excel; but especially wherewith that wonderful book the Bible agreeth. All that same concurrerth together, and make a Sphere or Globe, whose total parts are equidistant from the Center, as hereof more at large and more plain shall be spoken of in Christianly Conference.

But now concerning (and chiefly in this our age) the ungodly and accursed Gold-making, which hath gotten so much the upper hand, whereby under colour of it, many runagates and roguish people do use great villanies, and cozen and abuse the credit, which is given them: yea now adays men of discretion do hold the transmutation of Mettals to be the highest point, and fastigium in Philosophy, this is all their intent, and desire, and that God would be most esteemed by them, and honored, which could make great store of Gold,

and in abundance, the which with unpremeditate prayers, they hope to attain of the alknowing God, and searcher of all hearts: we therefore do by these presents publickly testifie, That the true Philosophers are far of another minde, esteeming little the making of Gold, which is but a parergon; for besides that they have a thousand better things.

And we say with our loving Father R.C.C. Phy: aureum nisi quantum aurum, for unto them the whole nature is detected: he doth not rejoyce, that he can make Gold, and that, as saith Christ, the devils are obedient unto him; but is glad that he seeth the Heavens open, and the Angels of God ascending and descending, and his name written in the book of life. Also we do testifie that under the name of Chymia many books and pictures are set forth in Contumeliam gloriae Dei, as we wil name them in their due season, and wil give to the pure-hearted a Catalogue, or Register of them: And we pray all learned men to take heed of these kinde of Books; for the enemy never resteth, but soweth his weeds, til a stronger one doth root it out. So according to the wil and meaning of Fra: C.R.C. we his brethren request again all the learned in Europe, who shal read (sent forth in five languages) this our Famam and Confessionem, that it would please them with good deliberation to ponder this our offer, and to examine most nearly and most sharply their Arts, and behold the present time with all diligence, and to declare their minde, either Cumcommunicate consilio, or singulatim by Print.

And although at this time we make no mention either of our names, or meetings, yet nevertheless every ones opinion shal assuredly come to our hands, in what language so ever it be; nor any body shal fail, who so gives but his name to speak with some of us, either by word of mouth, or else if there be some lett in writing. And this we say for a truth, That whosoever shall earnestly, and from his heart, bear affection unto us, it shal be beneficial to him in goods, body and soul; but he that is false-hearted, or onely greedy of riches, the same first of all shal not be able in any manner of wise to hurt us, but bring him to utter ruine and destruction. Also our building (although one hundred thousand people had very near seen and beheld the same) shall for ever remain untouched, undestroyed, and hidden to the wicked world, sub umbra alarum tuarum Jehova.

## Bibliographic Information

*Jindan sibaizi* 金丹四百字: Four Hundred Characters on the Golden Elixir: DZ 1081. Also appearing in *Xiuzhen shishu* 修真十書 (Ten Texts on Cultivating Perfection): DZ 263, j. 4.

Attributed to Zhang Boduan 張伯端 (d. 1082), commonly recognized as a central, early patriarch of the so-called Southern Lineage (Nanzong 南宗) of internal alchemy (*neidan* 內丹) and famous for his *Wuzhen pian* 悟真篇 (Chapters on Awakening to Perfection). Its earliest commentary dates from 1240. As the title indicates, this is a concise symbolic work on alchemical practice.

*Jindan sibaizi jie* 金丹四百字解: Explanations of the *Jindan sibaizi*: ZW 266: Appearing in the *Daoshu shier zhong* 道書十二種 (Twelve Daoist Texts).

A commentary on the *Jindan sibaizi* 金丹四百字 (Four Hundred Characters on the Golden Elixir) by Liu Yiming 劉一明 (Wuyuanzi 悟元子 [Master Awakening to the Origin]; 1734-1821), eleventh generation Longmen 龍門 (Dragon Gate) patriarch. Explains the meaning of the symbolic language and abstruse terminology of internal alchemy in terms of 18th-century Longmen views.

(Komjathy, 2004)

### Four Hundred Words on the Golden Elixir

This alchemical treatise ascribed to Zhang Boduan consists of twenty pentasyllabic poems. A lengthy undated preface states that it was intended for Ma Ziran 馬自然, a contemporary of Zhang Boduan and a putative disciple of Liu Haichan. The first allusion to the text is in a letter of thanks addressed by Bai Yuchan to Zhang Boduan in 1216. Bai claims to have come across the writings and commentaries by Ma Ziran on Mount Wuyi (Wuyi shan, Fujian), where he first read a work entitled "Sibai yan" 四百言 (Four Hundred Words; *Xiuzhen shishu*, 6.4b). While the commentator Huang Ziru 黃自如 (fl. 1241) seems to have no doubts about the authorship of the *Jindan sibaizi*, Yu Yan believed it to be a forgery written by Bai Yuchan himself.

The poem describes the inner alchemical process in a way similar to the *Wuzhen pian*, but borrows technical language from the Zhong-Lü texts. It was first included in Bai Yuchan's lost collection entitled *Qunxian zhuyi ji* 群仙珠玉集 (Anthology of Pearls and Jade of the Gathered Immortals; van der Loon 1984, 149). Since then, several editions with commentaries have appeared.

(Baldrian-Hussein, 2008: 558-9)

## Author's Introduction

One of the most important figures in the emergence of the Complete Reality movement was the eleventh-century adept Chang Po-tuan, who became known as the founder of the southern sect of the Complete Reality school. Chang is particularly known for his classic *Understanding Reality*, which has been a standard text of spiritual alchemy ever since, ranked on a par with the ancient *Triplex Unity*.

Another of Chang's important writings, translated here as *The Inner Teachings of Taoism*, presents a summary of Taoist practice in the alchemical format. It is a simplified, condensed version of the teachings of *Understanding Reality*, giving the main outlines of the alchemical work in twenty short verses. This text is presented here with a modern explanation written by the great Taoist commentator Liu I-ming in 1808. *The Inner Teachings of Taoism* became a very popular text, perhaps because of its brevity and accessibility. It was originally untitled, but later became known as Four Hundred Words on the Gold Elixir.

Following his verse-by-verse elucidation of Chang Po-tuan's text, Liu I-ming gives a summary in classic fashion with twenty verses of his own composition. Because of the general nature of Chang's text, Liu then adds notes on essentials of Taoist study and secrets of alchemy, to clarify practical procedure in an orderly fashion.

Liu I-ming was one of the foremost interpreters of Taoist classics in his time, and from a modern point of view his commentaries are unsurpassed in clarity. Deeply versed in both noumenal Confucianism and Ch'an Buddhism, he was dedicated to restoring the original principles and practices of Complete Reality Taoism.

(Cleary, 1986: xiv, xv, xvi)

金丹四百字  
Four Hundred Words on the Gold Elixir

- 1  
眞土擒眞鉛 True earth arrests true lead;  
眞鉛制眞汞 True lead controls true mercury.  
鉛汞歸眞土 Lead and mercury return to true earth;  
身心寂不動 Body and mind are tranquil and still.
- 2  
虛無發下雪 Nothingness produces white snow;  
寂靜發黃芽 Quiescence produces yellow sprouts.  
玉爐火温温 The fire warm in the jade furnace,  
鼎上飛紫霞 Over the crucible flies violet mist.
- 3  
華池蓮花開 Lotuses bloom in the flower pond;  
神水金波靜 Golden waves are quiet on the spiritual water.  
夜深月正明 Deep in the night, the moon just bright,  
天地一輪鏡 Heaven and earth are in one round mirror.
- 4  
朱砂煉陽氣 Red sand refines to positive energy;  
水銀烹金精 Liquid silver cooks into metal vitality.  
金精與陽氣 Metal vitality and positive energy,  
朱砂而水銀 Red sand and liquid silver.
- 5  
日魂玉兔脂 The solar yang soul, the fat of the jade rabbit;  
月魄金烏髓 The lunar yin soul, the marrow of the gold raven:  
撥來歸鼎中 Put them in the crucible and transmute them  
化作一泓水 Into a flood of water.
- 6  
藥物生玄竅 The medicines are produced in the occult opening;  
火候發陽爐 The firing process arises in the yang furnace.  
龍虎交會時 When the dragon and tiger have mated,  
寶鼎產玄珠 The gold crucible produces a mystic pearl.
- 7  
此竅非凡物 This opening is not an ordinary aperture:  
乾坤共合成 Made by heaven and earth together,  
名爲神氣穴 It is called the lair of spirit and energy;  
內有坎離精 Within it are the vitalities of water and fire.
- 8  
木汞一點紅 Wood mercury, one dash of red;  
金鉛三斤黑 Metal lead, three pounds of black.  
鉛汞結丹砂 Mercury and lead combine into granules  
耿耿紫金色 That shine violet-gold.
- 9  
家園景物麗 The home garden's scenery is beautiful;  
風雨正春時 The weather is that of spring.  
犁鋤不廢力 Without working with plow and hoe,  
大地皆黃金 The whole earth is golden.

10

真鉛生於坎  
其用在離宮  
以黑而變紅  
一鼎雲氣濃

True lead arises in water;  
Its function is in the palace of fire:  
Turning black to red,  
Fog is thick in the crucible.

11

真汞產於離  
其用卻在坎  
姪女過南園  
手持玉橄欖

True mercury comes from fire;  
Its function is in water.  
The maiden goes to the south garden;  
Her hand grips the jade balustrade.

12

震兌非東西  
坎離不南北  
斗柄運周天  
要人會攢簇

Thunder and lake are not east and west;  
Water and fire are not north and south.  
The handle of the dipper circles the heavens,  
Requiring people to understand how to aggregate.

13

火候不須時  
冬至豈在子  
及其沐浴法  
卯酉時虛比

The firing process does not call for set times;  
The winter solstice is not in december.  
As for the rules for bathing, spring and autumn  
Are also metaphors without reality.

14

烏肝與兔髓  
擒來歸一處  
一粒復一粒  
從微而至著

The raven's liver and the rabbit's marrow-  
Grab them and put them back in one place.  
Grain after grain,  
From vagueness to clarity.

15

混沌包虛空  
虛空括三界  
及尋其根源  
一粒如黍大

The undifferentiated contains space;  
Space contains the world:  
When you look for the root source,  
It is the size of a grain.

16

天地交真液  
日月含真精  
會得坎離基  
三界歸一身

Heaven and earth share the liquid of reality;  
Sun and moon contain the vitality of reality.  
When you understand the foundation of water and fire,  
The world is in your body.

17

龍從東海來  
虎向西山起  
兩獸戰一場  
化作天地髓

The dragon comes from the eastern sea;  
The tiger comes from the western mountains.  
The two beasts have a battle  
And turn into the marrow of heaven and earth.

18

金花開汞葉  
玉蒂長鉛枝  
坎離不曾閑  
乾坤今幾時

Gold flowers bloom with mercury petals;  
Jade stems grow on lead twigs.  
Water and fire have never been separate;  
How long do heaven and earth endure?

19

沐浴防危險  
抽添自謹持  
都來三萬刻  
差失恐豪釐

Bathe and ward off danger,  
Extract and add, taking care.  
In all, there are thirty thousand intervals;  
Beware of even the slightest slip.

20

夫婦交會時  
洞房雲雨作  
一載生箇兒  
箇箇會騎鶴

When husband and wife mate,  
Clouds and rain form in the secret room.  
In a year they give birth to a child,  
And each rides on a crane.

金丹四百字解  
Explanations of the Four Hundred Words on the Gold Elixir

註疏四百字真義歌  
Explanatory Verses

- 1  
真意發真知  
靈知亦自應  
三家合一家  
倏爾身心定  
True intent arouses real knowledge;  
Conscious knowledge also spontaneously responds.  
The three join as one,  
And at once body and mind are settled.
- 2  
虛室卻生光  
靜中又復陽  
采來勤鍛鍊  
化就紫金霜  
The empty room produces light;  
In quietude yang is restored:  
Gather it and diligently refine it,  
Transforming it into violet-gold frost.
- 3  
靈竅慧光生  
性現塵情滅  
朗朗夜明珠  
無處不皎潔  
In the spiritual opening the light of wisdom arises;  
Essence appears, and feelings about objects vanish.  
Clear and bright the jewel that glows in the dark;  
Everywhere is bright and clean.
- 4  
燥性化真性  
人心變道心  
若非神火鍛  
礦裡怎分金  
Volatility transmutes into true essence;  
The human mind changes into the mind of Tao.  
Without refinement by the spiritual fire,  
How can gold be separated from the ore?
- 5  
真知與靈知  
兩者班同氣  
經火烹鍊成  
渾淪沒點弊  
Real knowledge and conscious knowledge;  
These two are originally the same energy.  
Subjected to refinement by fire,  
They merge without a trace of defect.
- 6  
元竅真靈露  
趁時下手栽  
性情相眷戀  
長出大丹材  
In the occult opening real consciousness appears;  
Take the opportunity to get to work to nurture it.  
When essence and sense cleave to one another,  
They always produce the material for the elixir.
- 7  
有個虛靈竅  
號爲玄此門  
中藏神與氣  
原是魂魄根  
There is an opening of open awareness  
Which is called the opening of the mysterious female;  
Therein are stored spirit and energy,  
Originally the root of the celestial and earthly souls.
- 8  
靈知火裡精  
真知水中寶  
水火陰氣消  
光鮮著實好  
Conscious knowledge is the vitality within fire;  
Real knowledge is the jewel within water.  
When negativity within water and fire vanishes,  
The light is brilliant, truly sound.

9

靈藥自家有  
何須在外尋  
護持常照應  
左右儘珠林

The spiritual remedy is inherent in oneself;  
What is the need to seek it outside?  
Preserve the responsiveness of constant shining,  
And everywhere you go becomes a forest of jewels.

10

真知總是真  
卻要靈知配  
鍊去後天陰  
兩家成一塊

Real knowledge is all real,  
But it needs to be espoused by conscious knowledge.  
Refining away the yin of acquired conditioning,  
The two become one whole.

11

靈知好外遊  
須借真知制  
以婦去從夫  
坎離即既濟

Conscious knowledge likes to wander outside  
And needs to be governed by real knowledge;  
When the "wife" follows the "husband,"  
Water and fire balance each other.

12

震兌和坎離  
精神情性象  
若知攢簇方  
獨步崑崙上

Thunder, lake, water, and fire  
Are symbols of vitality, spirit, sense, and essence;  
If you know how to aggregate them,  
You walk alone atop the mountains of the immortals.

13

火候不拘時  
何勞嘯子午  
沐浴洗塵心  
卯酉豈能主

The firing process is not related to hour or season;  
Why bother to seek midnight and noon, winter and summer?  
Bathing is washing the dusty mind;  
How can spring and autumn govern it?

14

金情與木性  
不得有偏差  
兩者如同氣  
靈根自發花

"Metal" sense and "wood" essence  
Should not be unbalanced or disparate.  
The two are as the same energy;  
The spiritual root blooms of itself.

15

大則包虛空  
小還如黍米  
若問這根源  
一真而已矣

So great as to enfold space,  
Yet small as a grain of rice;  
If you ask about this root source,  
It is the one reality atone.

16

天地日月精  
吾身本自有  
真靈若不迷  
造化常在手

The vitalities of heaven and earth, sun and moon,  
Are fundamentally inherent in our bodies.  
If reality and consciousness do not stray from each other,  
Creation is always in the palm of your hand.

17

性起情來制  
情生性去牽  
相爭相關罷  
仍舊是先天

When essence arises, sense comes to stabilize it;  
When sense arises, essence goes to lead it.  
When their conflict and struggle are ended,  
Then, as of yore, they are unconditioned.

18

木性金情交  
真知靈知閣  
武鍊與文烹  
現出玲瓏塔

Essence and sense merge;  
Real and conscious knowledge join.  
With fierce refinement and gentle cooking,  
A crystal-clear temple is produced.

19

持心名沐浴  
溫養有抽添  
刻刻防危險  
功深自入玄

Controlling the mind is called bathing;  
Incubation involves extraction and addition.  
At every moment, forestall danger;  
As accomplishment deepens, you naturally enter the mystery.

20

會的陰陽理  
聖胎不難結  
生子又生孫  
長生永不滅

When you understand the principle of yin and yang,  
The spiritual embryo is not hard to form;  
Producing a child, also producing grandchildren,  
Eternal life never ends.

學人二十四要  
Twenty-Four Essentials for Students

- 1  
看破世事                      See through things of the world.  
世事若還看不破            If you cannot see through the things of the world,  
身沈苦海怎能出            You will sink into an ocean of suffering. How can you get out?
- 2  
斬斷牽纏                      Cut off entanglements.  
牽纏設若不能斷            If you cannot cut off entanglements,  
六道輪迴在眼前            The vicious cycles of compulsive habit stand before you.
- 3  
窮究理義                      Thoroughly investigate principle and meaning.  
不知辨別身心理            If you do not know how to discern the principles of body and mind,  
邪正難分誤路程            You cannot distinguish aberration and sanity, and miss the road.
- 4  
疇師訪友                      Find a teacher and associates.  
虚心即便能實腹            When you empty the mind, you can fill the belly;  
自滿到老無一長            If you are self-satisfied, you will grow old without development.
- 5  
立志長久                      Make determination endure.  
要成經久不易事            If you want to accomplish something that endures unchanging,  
必須經久不已功            It requires work that endures unceasing.
- 6  
除去嗔恨                      Get rid of anger and hatred.  
嗔恨若還不掃淨            If you do not sweep yourself clean of anger and hatred,  
滿腔濁氣掩真宗            You will be full of turbulence, which will obscure the truth.
- 7  
舍的色身                      Relinquish attachment to the physical body.  
看得色身如假物            See the physical body as something temporary and artificial,  
自然有路覓真身            And naturally there will be a way to seek the real body.
- 8  
不怕勞苦                      Do not be afraid of hard work.  
心強必上高山頂            With strength of mind, one will be able to climb to the summit;  
怕苦終久不入真            If you are afraid of hardship, you will never enter the real.
- 9  
忍辱受垢                      Tolerate ignominy and endure dishonor.  
忍辱卑而不可踰            Tolerate ignominy, and though lowly you cannot be surpassed;  
受垢柔而即能強            Endure dishonor, and through yielding you can be strong.
- 10  
饒人讓人                      Forgive people and defer to others.  
屈己尊人爲要著            It is essential to humble oneself and honor others;  
平心下氣是良方            Equanimous deference is a good method.
- 11  
輕財重命                      Take possessions lightly; take life seriously.  
試問堆金等岱嶽            Ask yourself-even if you pile up mountains of gold,  
無常買的不來無            Can you buy off impermanence?

- 12  
物我同觀  
物我同源無貴賤  
若分彼此起塵氛  
View others and self as the same.  
Others and self have the same source, without high or low;  
If you discriminate between "them" and "us," you raise dust.
- 13  
酒色不迷  
戒酒自然性不亂  
絕色必定命堅牢  
Do not be deluded by alcohol or sex.  
If you do not drink, your nature will not be deranged;  
If you are chaste, your life force will be stable.
- 14  
飢寒順受  
衣食隨緣修妄想  
若怕飢寒志不堅  
Accept hunger and cold as they come.  
Dressing and eating according to circumstances, stop idle imagination;  
If you are afraid of hunger and cold, your will won't be firm.
- 15  
生死任命  
死生二事儘由天  
訪道一心常在我  
Leave life and death to destiny.  
Two things, death and life, depend entirely on nature;  
The one will to seek the Way is always up to oneself.
- 16  
廣行方便  
到處積功兼累行  
見危盡力以扶人  
Do whatever you can to be helpful.  
Wherever you are, continue to perform worthy deeds;  
Seeing danger, exert your utmost power to help people.
- 17  
不愛熱鬧  
紛華境裡易迷真  
聲色場中能亂性  
Do not take a liking to excitement.  
It is easy to lose the real in the midst of excitement and glamour;  
In the realms of the senses you can derange your essential nature.
- 18  
不傲不盈  
高傲即便起人惡  
盈滿必非載道材  
Do not be proud or complacent.  
Arrogance arouses the hatred of others;  
If you are self-satisfied, you cannot bear the Tao.
- 19  
不貪美味  
君子謀道不謀食  
小人養口不養心  
Do not crave fine food.  
Superior people plan for the Way, not for food;  
Inferior people nurture the palate, not the mind.
- 20  
不言是非  
各人自掃門前雪  
莫管他人屋上霜  
Do not talk about right and wrong.  
Everyone should sweep the snow from his own door  
And not be concerned about the frost on another's roof.
- 21  
聰明不用  
有才不使常如拙  
有智深藏卻似愚  
Do not use intellectual brilliance.  
If you have talent, do not employ it; always be as if inept;  
If you have knowledge, hide it, appearing to be ignorant.
- 22  
睡少功多  
朝乾夕惕功無歇  
廢寢忘食志要堅  
Sleep less and work more.  
Working by day, cautious by night, effort never ceasing,  
Giving up sleep, forgetting to eat, the will must be firm.

23

不愛好物

珠玉金銀身外物

精神性命本來珍

Do not take a liking to fine things.

Pearls and jade, gold and silver, are things outside the body;

Vitality and spirit, essence and life, are the fundamental treasures.

24

始終如一

用功不力難深造

抱道而亡方見真

Be consistent from beginning to end.

If you work without strength, it is hard to reach deep attainment;

Only when you die embracing the Tao do you see reality.

丹法二十四訣  
Twenty-Four Secrets of Alchemy

1

修補丹房 Repair the alchemical workshop.  
培養後天 Nourish the temporal;  
堅強色身 Strengthen the physical body.  
培養後天第一端 To nourish the temporal is the point of departure;  
精神氣旺耐飢寒 When vitality, energy, and spirit are vigorous, one can bear hunger and cold.  
色身修得堅強瞭 Having cultivated the physical body until it is firm and strong,  
避雨遮風好鍊丹 Giving shelter from the rain and wind, it is good for refining the elixir.

2

鍊己築基 Refine the self and set up the foundation.  
懲忿窒欲 Overcome anger and lust;  
克己復禮 Conquer the self and return to normalcy.  
鍊己持心是築基 Refining the self and mastering the mind are building the foundation;  
塵情妄念儘拋離 Mundane feelings and idle thoughts are all to be thrown away.  
果然鍊到己無處 When you have refined your self to where it does not exist,  
不動不搖物怎迷 You are imperturbable and unshakable, and cannot be deluded by things.

3

立鼎安爐 Set up the crucible and furnace.  
剛以固其志 Stabilize the will with firmness;  
柔以用其功 Do the work with flexibility.  
志念堅牢爲立鼎 Making the will firm and strong is setting up the crucible;  
工夫漸進是安爐 Gradually progressing In the work is setting up the furnace.  
剛柔兩用無偏勝 Firmness and flexibility are both used, without imbalance;  
準備隨時運火符 Having prepared, work the fire and the convergence according to the time.

4

採取藥物 Cull the medicines.  
假中疇真 Seek the real in the artificial;  
砂裡淘金 Pick the gold out of sand.  
大藥三般精氣神 The great medicines are three-vitality, energy, spirit;  
須先辨別假和真 It is necessary first to distinguish the true from the false.  
是非隻隔一些子 The division between right and wrong is slight;  
莫把魁罡認北辰 Be careful not to mix them up.

5

以鉛制汞 Use lead to control mercury.  
真知不昧 When real knowledge is not obscured,  
靈知不飛 Conscious knowledge is not flighty.  
金情別號是真鉛 Another name for sense is true lead;  
木性輕浮以汞傳 Essence, light and mercuric, is represented as mercury.  
曉得情來鈴性法 When you understand the method of bringing sense to stabilize essence,  
人心不起道心園 The human mentality does not arise and the mind of Tao is complete.

6

黃婆調和 The yellow woman harmonizes.  
真意不散 When true intent does not scatter,  
陰陽自和 Yin and yang naturally harmonize.  
可知真意是黃婆 You should know that the true intent is the "yellow woman";  
一信能調四象和 Truthfulness alone can harmonize the four forms,  
攢簇五行皆借力 Aggregating the five elements uses its power;  
全形造命不離它 Perfecting the being and building life are not apart from it.

7

鉛汞相投           Lead and mercury intermingle.  
 性去求情           Essence goes to seek sense;  
 情來歸性           Sense comes back to essence.  
 以鉛投汞情歸性   Putting the lead in the mercury, sense returns to essence;  
 以汞投鉛性戀情   Putting the mercury in the lead, essence cleaves to sense.  
 情性相交無隔礙   When sense and essence merge without obstruction,  
 何愁大道不能成   There is no worry that the great Way will not be accomplished.

8

運火鍛鍊           Work the fire to smelt and refine.  
 振發正氣           Activate sane energy;  
 掃除邪氣           Sweep out aberrant energy.  
 文烹武鍊是仙方   Gentle cooking and fierce refinement are the methods of immortals;  
 火發神爐陰與陽   Fire comes forth in the spiritual furnace, yin and yang,  
 鍛儘千般波滓物   Burning away the thousand kinds of pollutants.  
 自然大藥起霞光   Naturally the great medicines emanate misty light.

9

還丹凝結           The restored elixir congeals.  
 剛柔相當           Firmness and flexibility balance each other;  
 性情如一           Essence and sense are as one.  
 性情如一號還丹   When essence and sense are unified, that is called the restored elixir;  
 朗朗真靈結就團   Bright and clear, reality and consciousness join into one whole.  
 已得當初無價寶   Having obtained the original priceless jewel,  
 小心護守運神觀   Carefully guard it; practice observation of the spirit.

10

沐浴溫養           Bathe and incubate.  
 念莫教起           Do not let thoughts arise;  
 意不使散           Do not let attention scatter.  
 滌垢洗塵沐浴方   Washing off defilement and dust is the method of bathing;  
 勿忘勿助閻陰陽   Do not be negligent, do not be forceful, join yin and yang.  
 諸緣不起丹元固   When entanglements do not arise, the basis of the elixir is stable;  
 養的靈根花蕊芳   Nurturing the spiritual root, the flower buds are fragrant.

11

丹元成熟           The basis of the elixir becomes mature.  
 黑中有白           Within black there is white;  
 靜極而動           When quietude culminates, there is movement.  
 黑中有白長生藥   Within black there is white-the herb of long life.  
 暗裡藏明續命湯   Within darkness is concealed light-the life-prolonging tonic.  
 鍊就玲瓏明淨物   Refining it into something crystal-clear and pure,  
 通天徹地放毫光   It penetrates heaven and earth with a ray of light.

12

吞服金丹           Ingest the gold elixir.  
 收神入室           Gather the spirit into the room,  
 點化群陰           Transmuting earthliness  
 服丹不是外來丹   The elixir ingested does not come from outside;  
 鍊就真靈在內安   The refined real consciousness rests within.  
 五府生光陰氣化   The internal organs produce light; earthly energy is transmuted;  
 不迷不昧破關闡   Without confusion or obscurity, obstacles are broken through.

13

移爐換鼎 Move the furnace and crucible.  
 本原到手 The root source in hand,  
 隨時種栽 Plant and nurture according to the time.  
 金丹到手有真傳 The gold elixir in hand, there is true transmission;  
 換鼎移爐玄又玄 Moving the furnace and crucible is a mystery within mystery.  
 從此虛心烹大藥 Henceforth carefully cook the great medicine,  
 先天竅裡鍊先天 Refining the primordial within the primordial opening.

14

凝結聖胎 Congeal the spiritual embryo.  
 百神俱集 All the spirit gathered,  
 五行混成 The five elements merge.  
 五氣朝元聚靈台 The five energies return to the origin and gather on the spiritual pedestal;  
 先天種子已牢栽 The primordial seed is already firmly planted.  
 如痴如醉如昏睡 As though an idiot, as though drunk, as though deep asleep,  
 恍惚杳冥結聖胎 In ecstasy and profound abstraction you congeal the spiritual embryo.

15

朝屯暮矇 Difficulty in the morning, darkness at night.  
 知雄守雌 Know the male, keep the female;  
 天然火鍊 Refine with the natural fire.  
 知雄更要守其雌 Knowing the male, it is also necessary to keep the female.  
 水火燻蒸不問時 Steaming with water and fire is not a matter of the hour.  
 自有樞機番卦象 There is naturally a pivot which turns over the trigrams;  
 何須著意強施爲 What is the need to make conscious effort?

16

溫養胎胚 Incubate the embryo.  
 如雞抱卵 Like a hen sitting on an egg,  
 似蚌含珠 Like an oyster embracing a pearl.  
 專一猶如雞抱卵 Concentrate single-mindedly, like a hen sitting on an egg;  
 至誠恰似蚌含珠 Be thoroughly sincere, like an oyster embracing a pearl.  
 時時靜守虛靈竅 Hour after hour quietly watch over the aperture of open awareness,  
 免得爐中水火孤 To avoid letting water and fire be isolated in the furnace.

17

防危慮險 Forestall danger.  
 外無其身 Externally oblivious of the body,  
 內無其心 Internally oblivious of the mind.  
 陽氣未純猶有險 Before celestial energy is thoroughly pure, there is still danger;  
 餘陰不盡要防危 As long as earthly energy is not exhausted, it is necessary to prevent peril.  
 後天滓質如消化 If the pollution of acquired conditioning is dissolved away,  
 可保胎元莫損虧 It can be guaranteed that the embryo will not be damaged.

18

十月胎圓 In ten months the embryo is mature.  
 先天氣純 Primordial energy is pure;  
 後天氣化 Conditioning is evaporated.  
 十月工夫胎始圓 After ten months of work, the embryo is finally mature;  
 後天化儘先天全 When conditioning is all dissolved, the primal is complete.  
 清清淨淨別無物 Utterly pure and clean, there is nothing else;  
 非色非空一自然 It is one naturalness, neither form nor void.

## 19

待時脫化 Wait for the time to break free.  
 無私無爲 No thought, no doing,  
 不即不離 Not obsessed, not indifferent.  
 脫化原來有日期 Basically there is a time to break free, transformed;  
 錯前錯後俱非宜 It will not do to be too early or too late.  
 誠中達外無容強 Truthfulness within reaches outside, not admitting force;  
 瓜熟自然蒂落離 When a melon is ripe, it naturally separates from the stem.

## 20

嬰兒出現 The infant emerges.  
 打破混沌 Breaking through nondifferentiation,  
 跳入虛無 Leaping into nothingness.  
 守定黃庭養谷神 Keep still in the yellow court and nurture the valley spirit;  
 形全氣足火停輪 With body complete and energy replete, the fire is stopped  
 乍雷一響天門破 With a peal of thunder, the gate of heaven opens,  
 跳出金剛不死人 And out leaps the indestructible immortal person.

## 21

乳哺三年 Breast-feed for three years.  
 光而不耀 Enlightened but not shining,  
 明而不用 Illumined but not using it.  
 真靈鍊就一金身 When real consciousness is refined into a golden body,  
 萬古千秋不落塵 It never ever falls into the dust.  
 乳哺三年光不耀 Nursing it for three years, enlightened but not shining,  
 知前曉後聖而神 Knowing before and understanding after, the sage is spiritual.

## 22

出入自便 Exiting and entering at will.  
 形神俱妙 Body and spirit both sublimated,  
 與道閻真 Merging into reality with the Tao.  
 形神俱妙等虛空 Body and spirit both sublimated, equal to space,  
 與道閻真萬法通 Merging in reality with the Tao, all things are penetrated.  
 顯晦逆從人莫測 Appearing, hiding, going against or along, no one can fathom it;  
 聚而有象散而風 Clustered, there is form; dispersed, the wind.

## 23

面壁九年 Facing a wall for nine years.  
 有無俱不立 Neither being nor nonbeing stand;  
 天地悉歸空 The universe is ultimately empty.  
 九年面壁有誰知 Nine years facing a wall, who is there that knows?  
 入室工夫不待思 The work of entering the room does not depend on thought.  
 天地歸空凡聖去 The universe returns to emptiness; ordinary and holy are gone;  
 寂寥境內結仙居 In the realm of silent serenity, the abode of immortals is built.

## 24

子又生孫 The child also produces grandchildren.  
 變化無窮 Transformation without end,  
 神妙不測 Unfathomable spiritual wonders.  
 子又生孫凡聖同 The child also produces grandchildren; ordinary and sage are the same –  
 隻分順去逆來中 The only distinction is in going along or coming back in reverse.  
 古仙留下大丹訣 Ancient immortals left the secret of a great elixir,  
 變化無窮到處通 With endless transmutations, getting through everywhere.

DR. CHRISTIAN MENTZELIUS,  
*Councillor and Court Physician to the Elector of Brandenburg,*

MY HONOURED PATRONS, AND

BELOVED FRIENDS.

**DEDICATORY EPISTLE**

**TO THE ABOVE-NAMED NOBLE AND HONOURABLE  
FRIENDS AND MASTERS.**

I neither can nor will withhold from my honoured and beloved friends the knowledge of this Spagyric Art, and of the most precious and miraculous Arcanum, which I have not only seen with my own eyes, but also executed with my own hands, by changing a mass of lead into solid gold, persistently resisting any test of fire, through the addition of a small particle of our transmutatory powder. It can no longer be pretended that our Art does not possess the power which it claims, or that the Mercury of the Sages is not the great and glorious fountain of all natural marvels. This wonderful secret has, through the grace of God, been revealed to me, and as it is unworthy of man, created in the image of God, to maintain silence in regard to God's miraculous works, like the brute beasts, I have determined to unveil this grand Arcanum to you, my beloved friends; and I will now gird myself to tell you all that I know and have heard of the sayings and doings of the Great Artist Elias. It was not, indeed, he who revealed to me the grand secret; yet his conversation was so instructive that I cannot refrain from reporting it to you word for word. It is my earnest wish, honoured friends and masters, that this Book may meet with a kindly reception at your hands, and that you may derive from it both enjoyment and profit. With this hope, I remain,

Your humble Servant,

JOHN FREDERICK HELVETIUS

**CHAPTER I.**

BEFORE I begin to write about the philosophical Pygmy vanquishing the Giants, my honoured friends and masters, you must permit me to transcribe a passage from the works of Helmontius (*Arbor Vitæ*, folio 630): "I cannot but believe that there is such a thing as a gold and silver making Stone. At the same time, I cannot shut my eyes to the fact that hundreds of painstaking Alchemists are daily being led astray by impostors or ignorant professors of the Spagyric Art." For this reason I shall not be astonished if—immediately upon perusing my book—multitudes of these deluded victims start up, and contradict the assertion which I have made in regard to the truth of this Art. One of these gentry denounces Alchemy as a work of the Devil; another describes it as sheer nonsense and humbug; a third admits the possibility of transmuting metals into gold, but maintains that the whole process costs more money than it is worth. But I do not wonder at these opinions. It is a hackneyed saying of human nature that we gape at those things whose purpose we do not understand, but we investigate things pleasurable to know. The Sages should therefore remember the words of Seneca (*De Moribus*): "You are not yet blessed, if the multitude does not laugh at you." But I do not care whether they believe or contradict my teaching about the transmutation of metals; I rest calmly satisfied in the knowledge that I have seen it with my own eyes, and performed it with my own hands. Even in our degenerate age these wonders are still possible; even now the Medicine is prepared which is worth twenty tons of gold, nay, more, for it has virtue to bestow that which all the gold of the world cannot buy, *viz.*, health. Blessed is that physician who knows our soothing medicinal Potion of Mercury, the great panacea of

death and disease. But God does not reveal this glorious knowledge to all men indiscriminately; and some men are so obtuse (with a judicial blindness) that they wonder at the activity of the simplest forces of Nature, as, for instance, the attractive power which the magnet exercises upon the steel. But (whether they believe it or not) there is a corresponding magnetic force in gold which attracts Mercury, in silver which attracts copper, and so with all other metals, minerals, stones, herbs, plants, etc. . . . We must not be surprised at this persistent opposition to truth: the light of the sun pains the eyes of owls.

As a matter of fact, we human beings take too much upon ourselves in hastily and dogmatically judging of things which we do not understand. We deny the influence of the stars upon earthly things, and by that denial only exhibit our ignorance. And what do we know of the secret forces which slumber in plants. You may know nothing of the glory of the Angels, the brightness of the heavens, the transparency of the air, the limpidity of the water, the variety of colours in flowers, the hardness of stones and metals, the proportionate beauty of men and animals, the image of God in regenerate souls, the faith of believers, the rationality of the mind, &c.—for we may be blind and without feeling or understanding—and yet the beauty of all these things is not in the least affected by our ignorance.

If we bear these considerations in mind, they ought to stop our mouths when we feel tempted to deny the possibility of such wonderful transmutatory virtue being inherent in our Stone. Still, it must not be supposed that I wish to force this knowledge upon any one. God has reserved it for the worthy, and I know that it can never become known to the wicked, the irreligious, or the scornful. All I propose to do is to lay before the reader, for his diligent consideration, those conversations which have passed between the Artist Elias and myself, in regard to the nature of this Stone, the splendour of which (being more glorious than the dawn, more brilliant than a carbuncle, more bright than the sun or gold) has not yet faded from my mind. The contempt of the scornful, and the ignorance of the foolish I despise. Their ephemeral babble will soon be swept away by the river of forgetfulness; but our triumphant Art, which is established upon a foundation of adamant, upon the foundation of God's own truth, will abide unshaken throughout all ages. For adepts according to ancient experience have given their word that this natural mystery is only to be found with JEHOVA Saturninely placed in the centre of the world. But those we call blessed, who can purge the Queen of the Sages of her impurity, who can circulate the Catholic Virgin Earth by means of our crystalline Physico-magical Art, and who have beheld the King, with his crown on his head, and his strength of inward fire, come forth from the chamber of his crystal grave, his bodily semblance glorified with all the most beautiful hues that the world affords, like a shining carbuncle, or like a transparent, compact, and diaphanous crystal—like a salamander that has spued forth all water, and washes away the leprosy of base metals with fire. Moreover, they shall behold the abyss of the Spagyric Art, where in the mineral kingdom, the same so royal art has, to a certain extent, for many years (in, as it were, the safest retreat of all) lain concealed. The Sages have seen the river in which Æneas was cleansed of his mortality—the river of Pactolus in Lydia which was changed into gold by King Midas bathing in it—the bath of Diana—the spring of Narcissus—the blood of Adonis trickling upon the snowy breast of Venus, whence was produced the anemone—the blood of Ajax, from which sprang the beautiful hyacinth flower—the blood of the Giants killed by Jupiter's thunderbolt—the tears which Althea shed when she doffed her golden robes—the magic water of Medea, out of which grass and flowers sprang forth—the Potion which Medea prepared from various herbs for the rejuvenescence of old Jason—the Medicine of Aesculapius—the magic juice, by the aid of which Jason obtained the Golden Fleece—the garden of the Hesperides, where the trees bear golden apples in rich abundance—Atalanta turned aside from the race by the three golden apples—Romulus transformed by Jupiter into a god—the transfiguration of the soul of Julius Cæsar into a Comet—Juno's serpent, Pytho, born of decomposed earth after Deucalion's flood—the fire at which Medea lit her seven

torches—the Moon kindled by Phaëthon's conflagration—Arcadia, in which Jupiter was wont to walk abroad—the habitation of Pluto in whose vestibule lay the three-headed Cerberus—the Pile, on which Hercules burnt those limbs which he had received from his mother, with fire, till only the fixed and incombustible elements derived from his father were left, and he became a god—and the rustic cottage whose roof was made of pure gold. Blessed, yea, thrice blessed, is the man to whom Jehovah has revealed the method of preparing that Divine Salt by which the metallic or mineral body is corrupted, destroyed, and mortified, while its soul in the meantime is revived for the glorious resurrection of the philosophical body—blessed, I say, is he to whom the knowledge of our Art is vouchsafed in answer to prayer throughout all his work for the Holy Spirit! For it should be remembered that this is the only way in which our Art of Arts is vouchsafed to man, and if you would attain it, the service of God ought to be your chief business. By committing themselves to this sacred and practical path of piety, and to theosophical colloquies alone with Jehovah, all true students of this Art will in due course of time, behold the sight which will gladden their hearts. Blessed, also, is he to whom some adept graciously flings wide the gates of knowledge, and to whom the golden road of the King is thus manifested! . . . I am afraid that the Preface will not please all my readers; nevertheless, I have a good hope that it will cheer and hearten the better part of them. Drink, my friends, from the fountain of truth, which wells forth in the Dialogue that I shall hereafter set down, and slake therewith the thirst of your souls, for my words shall be sweeter to you than nectar or ambrosia. For I bear in mind the saying of Julius Cæsar Scaliger that "the end of wisdom is its communication," and the teaching of Gregory of Nyssenus, who affirms "that the good delight to impart their knowledge to others, because it is the greatest joy to them to be useful."

## CHAPTER II.

The truth of this Art is maintained by many illustrious writers, of whom the following are the most distinguished representatives of their class:

Paracelsus (*Rev. Natur.*, ix., fol. 358) has the following words: "The true sign by which the Tincture of the Physicists is known, is its power of transmuting all imperfect metals into silver (if it be white) or gold (if it be red), if but a small particle of it be injected into a mass of such metals liquefied in a crucible."

Again: "The invincible Star of the Metals vanquishes all things, and changes them into a nature similar to its own. This gold and silver are better than those found in mines for the preparation of arcane medicines from it."

Again: "I say that any Alchemist, who has the Star of Gold, can change all metals into that precious substance."

Again: "Our Tincture of Gold contains stars, is a substance of the greatest fixity, is unchangeable in multiplication, is a red powder (with almost a saffron tinge), liquid like resin, transparent like crystal, fragile like glass, is of a rubinate colour, and of great specific gravity."

Again, in Paracelsus' book called "The Heaven of the Sages," and in his seventh book on the "Transmutation of Natural Things," he bears witness to the same fact: "Transmutation is a great natural mystery, which is by no means—as fools suppose—contrary to the course of Nature, or the law of God.

Without this Philosopher's Stone, the imperfect metals can be transmuted neither into gold nor silver."

Paracelsus, in his Manual concerning the Medicinal Philosopher's Stone, says: "Our Stone is the heavenly and super-perfect Medicine, because it washes away all the impurities of metals."

Henry Khunrath, in his "Amphitheatre of Eternal Wisdom" (fol. 147), has the following words: "I have visited many lands, and had speech of many learned men. I have seen the Green Catholic Lion, and the Blood of the Lion, *i.e.*, the Gold of the Sages, with my own eyes, have touched it with my hands, tasted it with my tongue, smelt it with my nose. By its means I have cured many whose life was despaired of."

Again (fol. 202): "That which I describe is not a myth: you shall handle it with your hands, see it with your eyes,—that Azoth, or Catholic Mercury of the Sages, which, together with inward and outward fire, in sympathetic harmony, through an unavoidable necessity, physico-magically united, is alone sufficient for the preparation of our Stone."

Again: "You shall see the Philosopher's Stone, our King and Lord of Lords, go forth from the chamber of its crystal tomb into this world, with its glorified body, regenerate and transcendently perfect, a brilliant carbuncle, whose most subtle and fully purified parts, being harmoniously mixed, are bound inseparably into one, altogether smooth, translucent as crystal, compact and exceedingly weighty. It is easily fused in fire, as resin, and after the flight of artificial quicksilver, just as wax. Without smoke it enters and penetrates solid bodies as oil enters paper. It is soluble in any liquid, melting and commingling with the same, fragile as glass, in a powder saffron-coloured, but in a solid mass, red like the ruby. Its purple colour is the mark of perfect fixation and fixed perfection, for it remains fixed and incombustible, even when exposed to fire, corrosive waters, or burning sulphur, since it is, like the salamander, incapable of being consumed by fire."

Again: "When the White Tincture is added to metals as a ferment, it transmutes them into purest silver; when the Red Tincture is mixed with pure gold, it is, within three days, multiplied by the quantity of the gold."

Helmontius ("On Life Eternal," page 590) has the following words:—"I have seen the Stone, and touched it with my own hands. . . . One-fourth of a grain of this powder, wrapped up in paper, I have cast upon eight ounces of boiling quicksilver in a crucible, and immediately the whole mixture was congealed into a mass like yellow wax; when the fusion was completed, the crucible contained eight ounces of purest gold (less eleven grains). So one grain of our powder had transmuted into purest gold 19,186 times its own weight of quicksilver,—and this process can be repeated indefinitely. The powder cleanses the metal from all impurity, and protects it from rust, decay, and fire, etc.

Again, the same Helmontius says, in his "Tree of Life" (page 630):—"I am compelled to believe that there is a Stone which produces gold and silver; for I have several times, with my own hands, projected one grain of powder upon one thousand grains of boiling quicksilver, which was thereby, in the presence of a great multitude of spectators, immediately transformed into precious gold. He who first gave me some of this transmutatory powder, had of it at least as much as would have sufficed for the production of 200,000 pounds of gold. He gave me about  $\frac{1}{2}$  grain of the powder, with which I transmuted  $9\frac{3}{4}$  ounces of quicksilver.

Moreover, the most honourable and profoundly learned Dr. Theodore Ketjes, an eminent physician resident

at Amsterdam, gave me a medal on which were the following inscriptions:

[IMAGE NOT INCLUDED]

On the obverse of the medal there appeared the following words:

AS THIS ART IS RARE AMONG MEN,  
SO IT IS RARELY EXHIBITED:  
PRAISED BE GOD FOR EVER WHO  
HAS COMMUNICATED PART OF  
HIS INFINITE POWER TO US HIS MOST  
ABJECT CREATURES.

It is also said that, in 1660, Alexander (a Scotch adept) effected a change of imperfect metals into gold, at Cologne, and at Hanover, etc.

There are also other instances on record of such transmutations having taken place.

The following is a genuine extract from a letter written by Dr. Kuffler:—

"First I found in my own laboratory, aquafortis, next in that of *Charles de Roy*, I poured it over calx of gold prepared in the ordinary way, and after the third cohobation, it sublimated with itself the tincture of gold in the neck of the retort, which I mingled with silver precipitated in the ordinary way, and I beheld that it had transmuted one ounce of sublimated tincture of gold in the crucible with the usual flux, and two ounces of precipitated silver, into an ounce-and-a-half of the best gold, while the third portion remained silver. The gold was white and fixed, but the remaining two parts were the best silver, fixed under the test of any fire. This is my experience, and I need not say that it has made me a most enthusiastic believer in Alchemy."

I, Helvetius, have seen this gold, without the tincture, white.

Another proof of the genuineness of this Art was given at the Hague, in the year 1664, when a silversmith, of the name of Gril, in the presence of many witnesses, transformed one pound of lead, partly into gold, and partly into silver. Gril had obtained the Tincture from a certain weaver of the name of John Caspar Knöttner, with the injunction to use it for metals only - Gril placed it with some lead in a glass cake dish, and after about a fortnight the above change was found to have taken place. I can testify to the genuineness of this case, as Gril was personally known to me, and I saw the transmuted lead, which exhibited on its surface a most beautiful silver crystal, in the form of a star, as though prepared by most ingenious artifice with a circle. The pity was that Gril, being obstinate and crafty, would not let Knöttner know whether it was his "Spirit of Salt" that had effected the change; and some time afterwards, when Gril's obstinacy had at length been overcome, Knöttner had forgotten which of his many chemical preparations he had given to him, and, before he was able to find out, he and his family were swept away by the plague, while Gril fell into the water and was drowned. Afterwards, not one of the many goldseekers was able to discover the secret which died with them. Nevertheless, it is a matter of never ceasing admiration that the Philosopher's Stone should have the power of transmuting, in so short a time, the dull and heavy nature of lead into the bright and brilliant nature of silver and gold; of this natural law, however, we have an illustration in the fact that steel, by contact with the magnet, acquires its magnetic power.

### CHAPTER III.

Since promises are all the more acceptable, the more quickly they are fulfilled, I will now, without any further delay, address myself to the task which I have set myself to accomplish.

On the 27 December, 1666, in the forenoon, there came to my house a certain man, who was a complete stranger to me, but of an honest, grave countenance, and an authoritative mien, clothed in a simple garb like that of a Memnonite. He was of middle height, his face was long and slightly pock-marked, his hair was black and straight, his chin close shaven, his age about 43 or 44, and his native province, as far as I could make out, North Holland.

After we had exchanged salutations, he asked me whether he might have some conversation with me. He wished to say something to me about the Pyrotechnic Art, as he had read one of my Tracts (directed against the Sympathetic Powder of Dr. Digby), in which I hinted a suspicion whether the Grand Arcanum of the Sages was not after all a gigantic hoax. He, therefore, took that opportunity of asking me whether I could not believe that such a grand mystery might exist in the nature of things, by means of which a physician could restore any patient whose vitals were not irreparably destroyed. I answered: "Such a Medicine would be a most desirable acquisition for any physician; nor can any man tell how many secrets there may be hidden in Nature; yet, though I have read much about the truth of this Art, it has never been my good fortune to meet with a real Master of the Alchemical Science." I also enquired whether he was a medical man, since he spoke so learnedly about the Universal Medicine. In reply, he modestly disclaimed my insinuation, and described himself as a brassfounder, who had always taken a great interest in the extraction of medicinal potions from metals by means of fire. After some further conversation; the Artist Elias (for it was he) thus addressed me: "Since you have read so much in the works of the Alchemists about this Stone, its substance, its colour, and its wonderful effects, may I be allowed the question, whether you have not yourself prepared it?" On my answering his question in the negative, he took out of his bag a cunningly-worked ivory box, in which there were three large pieces of a substance resembling glass, or pale sulphur, and informed me that here was enough of the Tincture for the production of 20 tons of gold. When I had held the precious treasure in my hand for a quarter of an hour (during which time I listened to a recital of its wonderful curative properties), I was compelled to restore it to its owner, which I could not help doing with a certain degree of reluctance. After thanking him for his kindness in showing it to me, I then asked how it was that his Stone did not display that ruby colour which I had been taught to regard as characteristic of the Philosopher's Stone. He replied that the colour made no difference, and that the substance was sufficiently mature for all practical purposes. My request that he would give me a piece of his Stone (though it were no larger than a coriander seed), he somewhat brusquely refused, adding, in a milder tone, that he could not give it me for all the wealth I possessed, and that not on account of its great preciousness, but for some other reason which it was not lawful for him to divulge; nay, if fire could be destroyed in that way, he would immediately throw it all into the fire. Then, after a moment's consideration, he enquired whether I could not shew him into a room at the back of the house, where we should be less liable to the observation of passers-by. On my conducting him into the state parlour (which he entered without wiping his dirty boots), he demanded of me a gold coin, and while I was looking for it, he produced from his breast pocket a green silk handkerchief, in which were folded up five medals, the gold of which was infinitely superior to that of my gold piece. On the medals appeared the following inscriptions:—

[IMAGE NOT INCLUDED]

I was filled with admiration, and asked my visitor whence he had obtained that wonderful knowledge of the whole world? He replied that it was a gift freely bestowed on him by a friend who had stayed a few days at his house, who had also taught him to change common flints and crystals into stones more precious than rubies, chrysoliths, and sapphires; he also revealed to me the preparation of crocus of iron (an infallible cure for dysentery), of metallic liquid (an efficacious remedy for dropsy), and of many other infallible Medicines, to which, however, I paid no great heed, as I was impatiently anxious to have the chief secret of all revealed to me. The Artist told me that his Master had bidden him bring him a glass full of warm water, to which he had added a little white powder, and in which one ounce of silver had melted like ice in warm water. Of this draught he emptied one-half, and gave the rest to me. Its taste resembled that of fresh milk, and its effect was most exhilarating."

I asked my visitor whether the potion was a preparation of the Philosopher's Stone? But he answered: "You should not be so inquisitive."

Then he told me that, at the bidding of the Artist, he had taken down a piece of leaden water-pipe, and melted the lead in a pot, whereupon the Artist had taken some sulphureous powder out of a little box on the point of a knife, and cast it into the melted lead, and that after exposing the compound for a short time to a fierce fire, he had poured forth a great mass of molten gold upon the brick floor of the kitchen.

"The Master bade me take one-sixteenth of the gold for myself as a keepsake, and to distribute the rest amongst the poor; which I did by making over a large sum in trust to the Church of Sparrendam. At length, before bidding me farewell, my friend taught me this Divine Art."

When my strange visitor had concluded his narrative, I besought him to give me a proof of his assertion, by performing the transmutatory operation on some metals in my presence. He answered evasively, that he could not do so then, but that he would return in three weeks, and that, if he was then at liberty to do so, he would shew me something that would make me open my eyes. He appeared punctually to the promised day, and invited me to take a walk with him, in the course of which we discoursed profoundly on the secrets of Nature in fire, though I noticed that my companion was very chary in imparting information about the Grand Arcanum; he spoke very learnedly and gravely concerning the holiness of the Art (just as if he were a clergyman), and said that God had commanded the initiated to make the secret known only to the deserving. At last I asked him pointblank to shew me the transmutation of metals. I besought him to come and dine with me, and to spend the night at my house; I entreated; I expostulated; but in vain. He remained firm. I reminded him of his promise. He retorted that his promise had been conditional upon his being permitted to reveal the secret to me. At last, however, I prevailed upon him to give me a piece of his precious Stone—a piece no larger than a grain of rape seed. He delivered it to me as if it were the most princely donation in the world. Upon my uttering a doubt whether it would be sufficient to tinge more than four grains of lead, he eagerly demanded it back. I complied, in the hope that he would exchange it for a larger piece; instead of which he divided it in two with his thumb, threw away one-half and gave me back the other, saying: "Even now it is sufficient for you." Then I was still more heavily disappointed, as I could not believe that anything could be done with so small a particle of the Medicine. He, however, bade me take two drachms, or half an-ounce of lead, or even a little more, and to melt it in the crucible; for the Medicine would certainly not tinge more of the base metal than it was sufficient for. I answered that I could not

believe that so small a quantity of Tincture could transform so large a mass of lead. But I had to be satisfied with what he had given me, and my chief difficulty was about the application of the Tincture. I confessed that when I held his ivory box in my hand, I had managed to extract a few small crumbs of his Stone, but that they had changed my lead, not into gold, but only into glass. He laughed, and said that I was more expert at theft than at the application of the Tincture. "You should have protected your spoil with 'yellow wax,' then it would have been able to penetrate the lead and to transmute it into gold. As it was, your Medicine evaporated, by a sympathetic process, in the metallic smoke. For all metals, gold, silver, tin, and mercury, are corrupted by the fumes of lead, and degenerated into glass." I shewed him the crucible, and there he discovered the yellow piece of Medicine still adhering to it. He promised to return at nine o'clock the next morning, and then he would shew me that my Medicine could well be used for transmuting lead into gold. With this promise I had to declare myself satisfied. Still I asked him to favour me with some information about the preparation of the Arcanum. He would not tell me anything about the cost and the time; "as to its substance," he continued, "it is prepared from two metals or minerals; the minerals are better because they contain a larger quantity of mature Sulphur. The solvent is a certain celestial Salt, by means of which the Sages dissolve the earthy metallic body, and this process elicits the precious Elixir of the Sages. The work is performed from beginning to end in a crucible over an open fire; it is consummated in four days, and its cost is only about three florins. Neither the Mineral from the Egg nor the Solvent Salt are very expensive." I replied that his statement was contradicted by the sayings of the Sages, who assign seven or nine months as the duration of the Work. His only answer was that the sayings of the Sages were to be understood in a philosophical sense and no ignorant person could apprehend their true meaning. I besought him that, as a stranger had made known to him this precious mystery, so he would extend to me the same kindness, and give me at least some information which would remove all the most formidable obstacles out of my path; for if one knew one thing, other facts connected with it were more easily discovered. But the Artist replied: "It is not so in our Magistry; if you do not know the whole operation from beginning to end, you know nothing at all. I have told you all; yet you do not know how the crystal seal of Hermes is broken, and how the Sun colours it with the marvellous splendour of its metallic rays, or in what mirror the metals see with the eyes of Narcissus the possibility of their transmutation, or from what rays adepts collect the fire of perfect metallic fixation." With these words, and a promise to return at nine o'clock the next morning, he left me. But at the stated hour on the following day he did not make his appearance; in his stead, however, there came, a few hours later, a stranger, who told me that his friend the Artist was unavoidably detained, but that he would call at three o'clock in the afternoon. The afternoon came; I waited for him till half-past seven o'clock. He did not appear. Thereupon my wife came and tempted me to try the transmutation myself. I determined, however, to wait till the morrow, and in the meantime, ordered my son to light the fire, as I was now almost sure that he was an impostor. On the morrow, however, I thought that I might at least make an experiment with the piece of "Tincture" which I had received; if it turned out a failure, in spite of my following his directions closely, I might then be quite certain that my visitor had been a mere pretender to a knowledge of this Art. So I asked my wife to put the Tincture in wax, and I myself, in the meantime, prepared six drachms of lead; I then cast the Tincture, enveloped as it was in wax, on the lead; as soon as it was melted, there was a hissing sound and a slight effervescence, and after a quarter of an hour I found that the whole mass of lead had been turned into the finest gold. Before this transformation took place, the compound became intensely green, but as soon as I had poured it into the melting pot it assumed a hue like blood. When it cooled, it glittered and shone like gold. We immediately took it to the goldsmith, who at once declared it to be the finest gold he had ever seen, and offered to pay fifty florins an ounce for it.

The rumour, of course, spread at once like wildfire through the whole city; and in the afternoon, I had visits from many illustrious students of this Art; I also received a call from the Master of the Mint and some other

gentlemen, who requested me to place at their disposal a small piece of the gold, in order that they might subject it to the usual tests. I consented, and we betook ourselves to the house of a certain silversmith, named Brechtil, who submitted a small piece of my gold to the test called "the fourth": three or four parts of silver are melted in the crucible with one part of gold, and then beaten out into thin plates, upon which some strong aquafortis is poured. The usual result of this experiment is that the silver is dissolved, while the gold sinks to the bottom in the shape of a black powder, and after the aquafortis has been poured off, and melted once more in the crucible, resumes its former shape. . . . When we now performed this experiment, we thought at first that one-half of the gold had evaporated; but afterwards we found that this was not the case, but that, on the contrary, two scruples of the silver had undergone a change into gold.

Then we tried another test, *viz.*, that which is performed by means of a septuple of Antimony; at first it seemed as if eight grains of the gold had been lost, but afterwards, not only had two scruples of the silver been converted into gold, but the silver itself was greatly improved both in quality and malleability. Thrice I performed this infallible test, discovering that every drachm of gold produced an increase of a scruple of gold, but the silver is excellent and extremely flexible. Thus I have unfolded to you the whole story from beginning to end. The gold I still retain in my possession, but I cannot tell you what has become of the Artist Elias. Before he left me, on that last day of our friendly intercourse, he told me that he was on the point of undertaking a journey to the Holy Land. May the Holy Angels of God watch over him wherever he is, and long preserve him as a source of blessing to Christendom! This is my earnest prayer on his and our behalf.

#### CHAPTER IV.

I will now proceed to give an account of the conversations which passed between the Artist Elias and myself (the Physician), on the occasion of his kindly visits to my house. The reader is to imagine the Artist entering my room, and introducing himself with the following words:

I salute you, Dr. Helvetius. I am one of the readers of the Tract you wrote against Dr. Digby, and his Sympathetic Pills, and I should like to have some conversation with you on 'his and kindred subjects. I am a close student of Nature's secrets, and delight in the company of those who have a kindred aim. And, certainly, I have found as the result even of my paltry investigations, that no natural marvels are to be rashly pronounced impossible.

PHYSICIAN.

Let me bid you a hearty welcome. Discourses on the secrets of Nature are the great delight of my heart, as they are of yours. Come with me, I pray you, into my study.

ARTIST ELIAS.

You do, indeed, possess a wonderfully well-equipped laboratory, and I make no doubt that, by its means, you have sounded all the secret depths of Alchemy. But why do you keep so many medicines? Do you not believe that there exists in the nature of things one or more remedies, fully capable of counteracting disease in all cases, where neither the heart, the liver, nor the lungs, are entirely destroyed, or the vital juices altogether consumed?

PHYSICIAN.

From what you say I conclude that you are either one of the profession, or else a Master of the Chemical Art. I do believe, as you say, that there exist in Nature other more excellent medicines than any that I possess. This view is both natural and reasonable, and it is supported by the authority of many celebrated writers. They tell us of a certain Universal Medicine, which, as they say, is known only to the elect, but it enables its possessors to heal all diseases (even those otherwise incurable), and to prolong their lives almost indefinitely. Yet is anyone able to conduct us to this miraculous fountain, whence this vitalizing water is drawn? I am afraid it is a hopeless aspiration.

ARTIST ELIAS.

I am not, as you suppose, a physician, but only a brass-founder. I have, however, from a very early age, taken an all-absorbing interest in the Art of Alchemy, and the secret qualities of metals. And as a result of my investigations (humble as they have been), I most decidedly incline to the belief that the discovery of the Medicine you mention will, even in our degenerate age, be vouchsafed to some earnest student, as a reward of prayer and work.

PHYSICIAN.

It is true that God grants His gifts to those who love Him ungrudgingly and without upbraiding. But I also find that in former ages, as in our own, there have lived hosts of chemists who have spent their lives, as the saying is, in scooping up water with a sieve. Moreover, it seems quite impossible to gain from the writings of the genuine Sages any intelligible information, either as to the substance or the mode of preparation of this Universal Philosopher's Stone. . . . In the meantime, it is the duty of a good physician to make the most of those appliances for the cure of disease, which are actually within his reach. If he refused to give any medicines until he had discovered the Universal Remedy, his patients would suffer through his folly and carelessness. Moreover, taking into consideration the great variety of human constitutions, I really do not see how one Medicine can possibly cure all diseases; the effect of morbid matter upon the glands and vital juices of different persons being well known to be utterly different. If you give a certain quantity of wine to Peter, it will make him quarrelsome, and even furious; its effect on Paul is to produce in him the mildness and timidity of a lamb; in Matthew it causes gaiety and laughter; while it makes Luke melancholy and tearful. In the same way, the morbid matter known as scorbutic poison becomes, in Peter's case, an acid, consuming the whole of the vital juices and organs, and breaking out on his hands and feet in the shape of bluish, discoloured boils. The same poison in the body of Paul is changed into a bitter aperient, which shews itself on the arms and feet in the form of subcutaneous red spots, with punctures like flea-bites, and, in times of plague, turns to anthrax. In the body of Matthew the poisonous fluid is of a sweetish taste, and produces on arms and legs watery tumours, like those seen in dropsical subjects; in times of plague, they turn to plague sores. In Luke's case, the humour is saltish and acrid; the swellings on his arms and legs are dry and inflammatory; and when there is infectious matter in the air, the sores become so red and malignant as to produce madness and death. It stands to reason, then, that these different symptoms require different treatment, and that no one herb or medicine could possibly suffice for such different cases. The volatile bitter salt of Cochlearia, which relieves Peter, makes Paul worse; a fixed acid salt only aggravates the symptoms of Luke, but it very often suffices to produce a complete cure in the case of Paul. In every instance we require a remedy which is different from the morbid matter already in the system, and therefore

capable of counteracting it. In the face of this need of specific remedies for every particular form of disease, you must pardon a medical man if he does not quite see the possibility of an Universal Medicine.

ARTIST ELIAS.

I admit the truth of all that you say, as far as the Vegetable Kingdom is concerned, though very few physicians employ this method of cure. At the same time, I see no reason why there should not be in the Mineral Kingdom an Universal Medicine which combines all the virtues of the different vegetable remedies you have named. I acknowledge that this Gift of Grace is bestowed only on a few persons; but the truth of the Alchemistic Art is too strongly supported to admit of any doubt.

PHYSICIAN.

I have by no means exhausted the list of objections which may with reason be urged against the existence of this Universal Medicine. But how can the same remedy be equally suited to the case of a man or a woman, a delicate and a robust person, the initiatory or the final stage of a disease, a chronic or an acute affection?

ARTIST ELIAS.

Your arguments against the Universal Medicine are very learned and orthodox, and I am not disinclined to allow to them some importance. At the same time, you will admit that "many men many minds" is a saying of some weight, and those who know anything by experience, are the best qualified to speak about it. The sweetest music does not delight all hearers; the best story appears dull to some readers; some like one kind of food or wine and some another: and so there are as many different verdicts about this Universal Medicine as there are (self-constituted) judges. But only he who is acquainted with its properties has a right to deliver an authoritative opinion. Now, it is quite true that in your common, tinkering Medicinal Art, which seeks to counteract only the separate symptoms or manifestations of disease, there is no room for an Universal Medicine. But the true physician knows that all disease (whatever shape it may assume) is simply a depression of the vital spirits, and that whatever strengthens vitality, will cut off the possibility of disease at the very source, expelling the humours which each produce their own peculiar malady, and I maintain that our Universal Medicine is a remedy of this radical kind. It gently promotes and quickens the movement of the vital spirits, and thus, by renewing the source of life, renovates and quickens the whole frame, infusing new vitality and strength into every part. For this reason adepts call it the Great Mystery of Nature, and the preventive of old age and disease. By its aid any man may live the full term of days naturally allotted to him, and need have no fear of contagion, even when the plague, or some other malignant epidemic, is striking down hundreds of his neighbours.

PHYSICIAN.

If I take your meaning, this Remedy does not set itself merely to correct depraved humours, but directly restores the vital spirits themselves; and it cannot prolong existence beyond the span of life originally allotted to each man by the Creator, though it does prevent his being cut off prematurely by weakness or disease. All this sounds very reasonable. But there is another question I should like to ask. Does this Medicine change a man's temperament, so as to convert a phlegmatic person into one of a sanguine character, or a melancholy person into a gay and jovial boon companion?

ARTIST ELIAS.

Certainly not. It is impossible for any medicine of any kind to alter the nature of a man: just as wine does not produce a change in a man, but only brings out his true character. The effect of the Universal Medicine is of a corresponding kind. It is like the warmth of the Sun, which does not change or even modify the shapes, colours, and scents of the different flowers, but only fully develops all that is in them by means of its genial influence. . . . If our Universal Medicine possessed the property of prolonging the life of man beyond the term assigned to each individual by Divine foreknowledge, no doubt Sages like Hermes Trismegistus, Paracelsus, Raymond Lullius, Count Bernhard, and many other genuine possessors of this Great Mystery, would be still with us in the land of the living. It would be folly and madness to suppose that any medicine in the whole world can do more than protect a man against being cut off prematurely, *i.e.*, before his appointed time.

PHYSICIAN.

All that you have said about the operation of this Blessed Universal Medicine seems both reasonable and in harmony with Nature's general plan of working. The worst of it is that, though I now fully believe in the existence of the Medicine, all my efforts to find it have hitherto resembled the futile endeavours of a mariner who, attempting to put out to sea in a frail boat, is again and again driven back to the shore by the united force of wind and wave. Though many illustrious persons have written concerning the preparation, they have so cautiously veiled it, that the smallest possible number might become acquainted with the steps to be taken to arrive at their desire. The best thing one can do, I think, is to stay in one's laboratory, work and pray, and wait for God's blessing.

ARTIST ELIAS.

You reason well, my friend; yet you must not despair of learning the secret of the Alchemists' Art, especially if you can induce some adept to become your teacher. But we will now proceed to discuss the transmutatory virtues of our most precious Stone, which are still more wonderful than its medicinal properties.

PHYSICIAN.

Oh, I see! You wish to discuss the transmutation of metals. In the possibility of such transmutation, I certainly do feel constrained to believe, considering that I have heard and read of cases which admit of no manner of doubt, and in which such transmutation is attested by the most authentic and trustworthy witnesses (such as Dr. Kiffler, Helmont, Scotus, &c.), as having really taken place. I am especially thinking of that wonderful experiment of metallic transformation which was achieved at Prague, in the presence of the German Emperor Ferdinand III., when, by means of one grain of the Tincture, three pounds of Mercury were changed into the best gold; for that event was commemorated by a medal struck at the Imperial Mint. But though I firmly believe in the possibility of such a transmutatory Tincture, I have never in the whole course of my life come across any one who possessed it.

ARTIST ELIAS.

You are quite right in what you say, albeit your belief or unbelief could not make any difference to the truth

of our Art, just as a magnet would go on attracting steel, and rendering it magnetic by such contact, even if you did not credit it. It is also true that hitherto our secret has been rather hidden than revealed by those who have written about it in the obscurest of language. But you can no longer feel disposed to doubt that which you see with your own eyes; and here in this box you behold a large quantity of the true substance of the Sages. There! Examine it.

PHYSICIAN.

Is this yellow, sulphureous, glassy substance really and truly the Philosopher's Stone? Did you prepare it yourself? Surely you are hoaxing me!

ARTIST ELIAS.

No, indeed; you now hold the most precious of mundane treasures in your hand; and I myself prepared it from beginning to end. If you can take me to a room where we shall be more secret, I will show you some gold obtained through its means (and having been ushered into the state parlour, he produced the five medals described above). These (said he) I keep in memory of my Master.

PHYSICIAN.

So you had a Master from whom you learned the glorious secret! How wonderful that I should at this moment be holding the true substance in my hands! Can you not give me a small piece of it, just enough to transmute four grains of lead into gold, so that I may be able to test the truth of your statement? Do give me a piece, at least as large as a grain of mustard seed, and let me make the trial! It would be a great kindness.

ARTIST ELIAS.

I admit that a certain stranger once instructed me both as to the possibility of this Art, and in its methods of procedure. But I cannot give you even a small fragment of my Tincture, though you offered me this room full of ducats; not because the substance is so precious in my eyes, but for another momentous reason which I may not reveal. Indeed, if fire could consume fire, I should at once throw the whole of this Tincture on the hearth. I will, however, return to you after the lapse of three weeks, and shew you some beautiful experiments which will both surprise and delight you. If by that time I shall have obtained leave to do so, I will also satisfy your curiosity by performing in your presence a change of lead into gold. In the meantime, I bid you good-bye, and warn you not to invest too much of your substance in the pursuit of this Art, as it will all turn to ashes.

PHYSICIAN.

I am deeply obliged to you for your kindness in coming to me, and shewing me this Stone; but you can hardly expect me to be satisfied with the mere sight of it. I am one of those whose souls are always athirst for knowledge; and I believe that if our first parent Adam, who lost Paradise by touching the forbidden fruit, were alive at the present day, he would once more risk the happiness of his life in order to become possessed of the "golden apples from the garden of Atlas." I thank you most heartily, however, for comforting me with the prospect of your return in three weeks. I will endeavour to spend the interval in strict obedience to your wise and kindly counsel; but you may easily suppose that the feeling uppermost in my mind will be one of eager hope and longing for the fulfilment of your promise. I also thank you for the

proof of your confidence involved in making yourself known to me as an adept of this Art. If the secret which you have entrusted to my safe keeping, were, by any accident, to come to the ears of a tyrannical prince or noble, would you be terrified by his threats into betraying it?

ARTIST ELIAS.

I have never made this secret known to anyone except to. yourself and one good old man. Nor must any human being hear or see the like in future. But if any prince or king were to cast me into prison, or put me to the rack, he would not be able to extract a single syllable of direct or indirect information from me by the most cruel tortures which he could devise; not even death itself would make me shrink from the path of duty, or become disloyal to my trust.

PHYSICIAN.

Are there any Alchemistic writers that are more easily understood than the rest, or who can at least be warranted to possess a real knowledge of those things wherein they undertake to instruct others?

ARTIST.

I do not read many of these books; but of all the writers on Alchemy whose works I have studied, I have found Sendivogius, the Cosmopolitan, to be the most trustworthy; also Basilius, in his twelve Keys. Truth has chosen the obscure style of Sendivogius for her hiding-place, if you could only discover her—just as our Substance is really and truly hidden and concealed in the outward bodies of all metals and minerals.

PHYSICIAN.

Accept once more my warmest thanks for all your kindness and friendly counsel. I do indeed believe that, as you say, the essences of metals are hidden in their outward bodies, as the kernel is hidden in the nut. Every earthly body, whether animal, vegetable, or mineral, is the habitation and terrestrial abode of that celestial spirit, or influence, which is its principle of life and growth. The secret of Alchemy is the destruction of the body, which enables the Artist to get at, and utilize for his own purposes, the living soul. But what man is sufficient to search out this wonderful secret?

ARTIST ELIAS.

You have spoken truly, and judged rightly concerning the natural destruction of things; and if you find grace in the sight of God, He will commission either me or some other adept of our Art to unfold to you the right way of destroying the outward bodies of metals and seizing the inward, vital, life-giving soul. This gracious gift, I say, God may bestow on you sooner than you think, in answer to devout and earnest prayer. Once more, farewell, and rest assured that I will always remain your friend. I cherish a fond hope that I shall soon see you again, in a flourishing state of health.

With these words he departed; and I have already told you how after three weeks he came back and gave me a small piece of the transmutatory Tincture. But since our second parting I have neither set eyes on him, nor heard either of him or from him.

He has, however, left deeply seated in my heart the conviction that through metals and out of metals purified by highly refined and spiritualized metals there may be prepared the living gold and quicksilver of the Sages, which bring both metals and human bodies to perfection. If my friend had condescended to give me one or two practical hints as to the best method of proceeding in this Magistry, I might have discovered the grand secret of collecting the rays of the Sun and Moon in their own proper womb, whereby their power of metallic transmutation by magnetic sympathy might have been brought out. Thus I might have obtained the red seed which transmutes into gold, and the white seed which transmutes into silver. For the Artist Elias told me that the Chalybs of Sendivogius was that true Mercurial metallic humour which—without the aid of any corrosive—would suffice to separate the fixed rays of the Sun and Moon from their body, and to render them volatile and Mercurial for the dry philosophical Tincture which he shewed me, and the efficacy of which I subsequently experienced. This is the same method by which metals are still being produced day by day in the bowels of the earth, and stones developed, in their different saline wombs, out of the spiritual tingent sulphureous seed. . . . Metallic sulphur mixed with saltpetre, may be converted, by gentle heat, first into solid earth, then into air, then into limpid water, and then into glass of a most beautiful colour, and of a penetrativeness superior to that of fire—just as the chicken is developed out of the apparently lifeless egg by gentle heat. Between the different metals there exists a sympathy such as that between the magnet and steel, gold and quicksilver, silver and copper; and this sympathy is the *rationale* of the transmutation of metals. On the other hand, there are also metallic antipathies, such as that of lead to tin, of iron to gold, of lead to mercury—antipathies which have their counterpart in the animal and vegetable worlds. An accurate and comprehensive knowledge of these sympathies and antipathies is the one great qualification of every man who aspires to be a Master of this Art.

In making known to you all that I have seen and experienced, I am only following the maxim of Seneca, who said that he desired knowledge chiefly that he might impart it to others. If anyone doubts the truth of my statements, let him but live a pious and Christ-like life here below, and he will learn the truth of all things in the new Jerusalem above. That a share of this glory may be vouchsafed to you and him, is the prayer of

Your faithful and loving servant,  
JOHN FREDERICK HELVETIUS, M.D.

# MAGNALIA NATURAE, PRAECIPUE QUOAD USUS HUMANOS

[Tr: "The Wonderful Works of Nature, in Particular Regard to Human Uses"]

The prolongation of life.  
The restitution of youth in some degree.  
The retardation of age.  
The curing of diseases counted incurable.  
The mitigation of pain.  
More easy and less loathsome purgings.  
The increasing of strength and activity.  
The increasing of ability to suffer torture or pain.  
The altering of complexions, and fatness and leanness.  
The altering of statures.  
The altering of features.  
The increasing and exalting of the intellectual parts.  
Versions of bodies into other bodies.  
Making of new species.  
Transplanting of one species into another.  
Instruments of destruction, as of war and poison.  
Exhilaration of the spirits, and putting them in good disposition.  
Force of the imagination, either upon another body, or upon the body itself.  
Acceleration of time in maturations.  
Acceleration of time in clarifications.  
Acceleration of putrefaction.  
Acceleration of decoction.  
Acceleration of germination.  
Making rich composts for the earth.  
Impressions of the air, and raising of tempests.  
Great alteration; as in induration, emollition, &c.  
Turning crude and watry substances into oily and unctuous substances.  
Drawing of new foods out of substances not now in use.  
Making new threads for apparel; and new stuffs, such as paper, glass, &c.  
Natural divinations.  
Deceptions of the senses.  
Greater pleasures of the senses.  
Artificial minerals and cements.

## Chapter I

### Of the Claims of our Art, its Students, and its Method

All men who devote their lives to the study of any art, or to any kind of occupation, have before their eyes, as the aim of their efforts, perfection in the thing which they pursue. But only few attain to the goal of their wishes: there are many architects, but few masters of the art of architecture; many students of medicine, but few men like Hippocrates or Galen; many mathematicians, but few proficient like Archimedes; many poets, but few worthy to rank with Homer. Yet, even men who have nothing more than a respectable knowledge of their calling, are capable of being useful to society.

Among those who devote themselves to the transmutation of metals, however, there can be no such thing as mediocrity of attainment. A man who studies this Art, must have either everything or nothing. An Alchemist who knows only half his craft, reaps nothing but disappointment and waste of time and money; moreover, he lays himself open to the mockery of those who despise our Art. Those, indeed, who succeed in reaching the goal of the Magistry, have not only infinite riches, but the means of continued life and health. Hence it is the most popular of all human pursuits. Anyone who has read a few "Receipts" claims the title of a Sage, and conceives the most extravagant hopes; and, in order to give themselves the appearance of very wise men indeed, such persons immediately set themselves to construct furnaces, fill their labora

tories with stills and alembics, and approach the work with a wonderful appearance of profundity. They adopt an obscure jargon, speak of the first matter of the metals, and discuss with a learned air the rotation of the elements, and the marriage of Gabritius with Beya. In the meantime, however, they do not succeed in bringing about any metamorphosis of the metals, except that of their gold and silver into copper and bronze.

When captious despisers of our Art see this, they draw from such constant failures the conclusion that our Art is a combination of fiction and imposture; whilst those who have ruined themselves by their folly confirm this suspicion by preying on the credulity of others, pretending to have gained some skill by the loss of their money. In this way the path of the beginner is beset with difficulties and pestilent delusions of every kind; and, through the fault of these swindlers, who give themselves such wonderful airs of profundity and learning, our Art itself has fallen into utter disrepute, though these persons, of course, know nothing whatever about it. The beginner finds it extremely difficult to distinguish between the false and the true in this vast Labyrinth of Alchemy. Bernard of Trevisa warns him to eschew like the plague these persons who hold out so many vain and empty promises; while I have written this Treatise for the guidance of the blind, and the instruction of the erring. I wish, in the first place, to clear our Art from the slanders which have been cast upon it, then to describe the qualifications of its students and its methods of procedure. After these prefatory explanations, I will gird myself to a description of the Art itself.

Before I say anything else, I would record my most earnest protest against that method of reasoning by which the deceptions of certain wretched sophists are laid to the charge of this science. The wickedness of some of its lying professors can prove nothing either for or against its genuineness. Such a position could be made good only

by arguments based on natural relations; but such arguments it is impossible to find. The light of Nature is too bright to be darkened by these obscurists. I hope my Book will shew that the Transmutation of Metals, from an imperfect to a perfect state, is a real and true achievement, and that by the cooperation of Nature and Art. The only thing that distinguishes one metal from another, is its degree of maturity, which is, of course, greatest in the most precious metals; the difference between gold and lead is not one of substance, but of digestion; in the baser metal the coction has not been such as to purge out its metallic impurities. If by any means this superfluous impure matter could be organically removed from the baser metals, they would become gold and silver. So miners tell us that lead has in many cases developed into silver in the bowels of the earth; and we contend that the same effect is produced in a much shorter time by means of our Art. It is a fact that the Mercury which is generated in the bowels of the earth, is the common substance of all metals --- since this Mercury will enter into combination with every kind of metal --- which could not be the case if it were not naturally akin to them all. Mercury is a water that will mix with nothing that is not of the same nature. By Art, the handmaid of Nature, Mercury can be so successively concocted with all metals, that one and the same under the same colour and flux, may subalternately shew and express the true temperature and properties of them all. Moreover, all metals are capable of being resolved into running Mercury --- and surely this could not be if it were not their common substance. Again, the Mercury of lead may become that of iron, the Mercury of iron that of copper; while the Mercury of tin may even be transmuted into that of silver and gold --- a fact which triumphantly demonstrates the substantial affinity of all the metals. From antimony, too, a good Mercury is obtained, which some of our Artists are able to change into metallic mercury. It is also a well-established fact that the Mercury gained from any metallic or mineral body possesses the properties of assimilating common Mercury to its own nature; thus common Mercury may become that of all metals in turn. Do not these arguments clearly shew that there is one Mercury, and that in the various metals it is only differentiated according to their different degrees of digestion or purity? I do not see how these arguments can be answered. It is possible indeed that some dull person may allege in refutation of our reasoning his inability to accomplish those chemical transformations on which it is based; but such operators would be vindicating too great an honour for their ignorance if they claimed to advance it as an argument against the truth of our Art. They must not make their own little understandings the standard or measure of the possibilities of Nature. At any rate, my word is as good as theirs (and better, since they can never prove a negative), and I do most positively and solemnly assert that I have with my own hands performed every one of the experiments which I have described; and I know many others whose experience has shewn these things to be true. How can our opponents hope to prevail against eye-witnesses by bare negation? My testimony is borne out by the experience of such men as Albertus, Raymund, Riplaeus, Flamellus, Morienus, and a host of others. I confess that the transformations of which I have spoken are not easy to accomplish, but whoever has the Key of our Art can unlock all gates, and has power over all the secrets of Nature. But this Key is possessed only by those who have both a theoretical and a practical knowledge of natural processes. I could here reckon up divers mutations of metals, as, for instance, Mars into Venus, by the acid stalagma of vitriol, Mercury into Saturn, Saturn into Jupiter, Jupiter into Lune, which operations, indeed, many vulgar chemists (far enough from the top of the art) know how to perform. I might also add what is known only to a few philosophers, that there is a secret substance intermediate between metals and minerals the mixed heavenly virtues of which produce a certain metal without a name, which is, strictly speaking, not a metal at all, but a Chaos, or Spirit, for it is all volatile: from this all metals can be

educated without transmutatory Elixir, even gold, silver, and mercury. It is called Chalybs by the author of the "New Light," and it is the true key and first principle of our Art. What though the Sages have hidden all these things, and set them forth parabolically for the true sons of knowledge? Are they any the less true for that reason?... All that is wanted for the perfect development of an imperfect substance, is the gentle, digestive action of a homogeneous agent. This agent is gold, as highly matured as natural and artificial digestion can make it, and a thousand times more perfect than the common metal of that name. Gold, thus exalted, radically penetrates, tinges, and fixes metals. This scientific fact we may illustrate in the following manner. If you take six pounds of silver, and gild it with a single ounce of gold, you may afterwards draw out the silver into threads of the greatest fineness, and still distinctly perceive in each thread the brilliancy of gold. If then this dead, bodily, and earthy metal (which, as a body, of course, has no power to enter another body) can produce so wonderful an effect, does it seem incredible that the spirit of this gold, which can enter and animate the bodies of other metals, should transform them into its own nature? If we had this spiritual tincture, is it not clear that it would do inwardly what the body of the gold is seen to do outwardly? Remember that our Tincture is the Quintessence of gold, and infinitely more perfect than the mere body of gold can ever be; and that it has, therefore, an infinitely greater power of diffusing its essential quality. If gold thus spiritually enters another metal, it will clearly assimilate it to its own nature. The method of this spiritual ingestion we shall describe further on. Let us only add in this place, where we are discussing the rationale of metallic transmutation, that seed is the perfection of any seed-bearing substance; that which has no seed is altogether imperfect. It is, then, as the poet sings: "Gold contains the seeds of gold, though they be deeply hidden." Gold is not only perfect, but the most perfect thing of its kind (ie., of metals). If gold has seed, it must be contained in water, which is the habitation of all spirits, seed being a certain spiritual means of conserving any species. If gold is to be dissolved for the purpose of educating its seed, the dissolution will have to take place by means of this same metallic water. When this dissolution takes place, the gold puts off its earthly form, and assumes a watery form. Now, gold being both the starting point and the goal in the whole of this generative process, it is clear that all intermediate operations must be of a homogeneous character, ie., they must consist in gradual modifications of this seed of gold. The processes of our Art must begin with the dissolution of gold; they must terminate in a restoration of the essential quality of gold. But as the negative can never become the positive, the final form of our gold must be essentially different from its initial one. The final form is so much more noble than the initial one as fire is more subtle and spiritual than earth. What I have written is enough for the faithful student of our Art; and to its hostile and carping critics this book is not addressed. Therefore, I will now go on to add a word or two about the qualifications of those who should study this noble science. Our Art has fallen into disrepute, as I have said, through the stupidity and dishonesty of many of its professors. They are ignorant mechanics who, not having skill and brains enough for an honest trade, must needs meddle with our Art, and, of course, soon lose all they possess. Others, again are only just less ignorant than these persons; they are in too great a hurry to make gold before they have mastered even the rudiments of natural science; of course they fail, spend all they have, borrow money from their friends, amuse themselves and others with hopes of infinite wealth, learn to talk a barbarous semiphilosophical jargon, and afford a capital handle to those who have an interest in abusing our Art. Again, there are others who really have a true knowledge of the secret, but who grudge others the light which has irradiated their own path; and who therefore write about it in hopelessly puzzling language, which the perplexed beginner cannot possibly understand. To this class belong Geber, Arnold, and Lullius, who

would have done much better service to the student, if they had never dipped pen in ink. The consequence is that every one who takes up this study at once finds himself lost in a most perplexing labyrinth of falsehood and uncertainty, in which he has no clue. I will therefore try to give him some sound advice as to the best way of accomplishing his object.

In the first place, let him carry on his operations with great secrecy in order that no scornful or scurrilous person may know of them; for nothing discourages the beginner so much as the mockery, taunts, and well-meant advice of foolish outsiders. Moreover, if he does not succeed, secrecy will save him from derision; if he does succeed, it will safeguard him against the persecution of greedy and cruel tyrants. In the second place, he who would succeed in the study of this Art, should be persevering, industrious, learned, gentle, good-tempered, a close student, and neither easily discouraged nor slothful; he may work in co-operation with one friend, not more, but should be able to keep his own counsel; it is also necessary that he should have a little capital to procure the necessary implements etc., and to provide himself with food and clothing while he follows this study, so that his mind may be undistracted by care and anxiety. Above all, let him be honest, God-fearing, prayerful, and holy. Being thus equipped, he should study Nature, read the books of genuine Sages, who are neither impostors nor jealous churls, and study them day and night; let him not be too eager to carry out every idea practically before he has thoroughly tested it, and found it to be in harmony not only with the teaching of all the Sages, but - also of Nature herself. Not until then let him gird himself for the practical part of the work, and let him constantly modify his operations until he sees the signs which are described by the Sages. Nor let him despair though he take many false steps; for the greatest philosophers have learned most by their mistakes. For his guidance in these operations he will find all the light he requires in the following treatises.

---

## Chapter II

### **Of the Origin of this Art and its Writers; its Fundamental Metallic Principles, and the Gradual Production of Metals and Minerals**

Hermes, surnamed Trismegistus, is generally regarded as the father of this Art; but there are different opinions with regard to his identity. Some say he was Moses; all agree that he was a very clear-sighted philosopher, the first extant author on the subject, and was also of Egyptian extraction. Others say that Enoch invented the Art, and, before the coming of the Flood described it on the so-called emerald tables, which were afterwards found by Hermes in the valley of Hebron. Many assert that it was known to Adam, who revealed it to Seth; that Noah carried the secret with him into the Ark, and that God revealed it to Solomon. But I do not agree with those who claim for our Art a mystical origin, and thus only make it ridiculous in the eyes of a scornful world. If it is founded on the eternal verities of Nature, why need I trouble my head with the problem whether this or that antediluvian personage had a knowledge of it? Enough for me to know that it is now true and possible, that it has been exercised by the initiated for many centuries, and under the most distant latitudes; it may also be observed that though most of these write in an obscure, figurative, allegorical, and altogether perplexing style, and though some of them have actually mixed falsehood with truth, in order to confound the ignorant, yet they, though existing in many series of ages, differing in tongue and nation, have not diversely handled one operation, but do all exhibit a most marvellous and striking agreement in regard to the main features of their teaching --- an agreement which is absolutely inexplicable, except on the supposition that our Art is something more than a mere labyrinth of perplexing words. Our Art is most plainly and straightforwardly expounded by Bernard of Trevisa, Ripley the English man, Flamellus the Frenchman, Sendivogius, the author of the "New Light," the anonymous author of the "Arcanum of Hermes," who also wrote *Enchiridion Physicae Restituae*, and "The Ladder of Philosophers," the great "Rosary," the "Child's Play," the Tract of Dionysius Zachary, the works of Morienus, the works of Egidius de Vadis, Augurellus' poem entitled "Goldmaking," the works of Peter Bonus of Ferrara, and the "Abridged Rosary." Let the student procure one or more of these, and similar genuine works on Alchemy, and let him study the secrets of Nature by the light which they throw upon it. He will find a knowledge of natural science, and more particularly of mineralogy, indispensable for his purpose.

All philosophers tell us that there are four elements, which compose all things, and, by means of their diverse combination, produce various forms. But the truth is that there are only three elements, i.e., those which of their own nature are cold --- air, water, and earth. The defect of heat which we perceive in them is in proportion to their distance from the sun. Fire I do not acknowledge as an element. There is no fire, except the common fire which burns on the hearth; and its heat is essentially destructive. The heat there is in things is the product either of light, or motion, or life, or alterative processes. Fire is not an element, but a robber that preys on the products of the four elements; it is a violent corruptive motion caused by the clashing of two active principles. Thus, we see that it is an operation of two other substances, not a substance in itself --- a result of the active co-operation of a comburent and a combustible. The nature and characteristic quality of the three elements is cold, and they possess heat only as an accident... Nor is it true that objects are formed by a mixture of these three elements; for dissimilar things can never really unite, seeing

that union is a complete mixture and concretion of the smallest atoms or molecules of two substances. But such a mixture is impossible in the case of two dissimilar matters, as, for instance, between water and earth (or water and wine); they admit of being separated at any time on account of the disproportion of their smallest particles. It may be said that for the sake of union the grosser element becomes as subtle as the other; but if this were the case, if for the purpose of union water became as subtle as air, that would simply mean that water became air, an assumption which would thus fail to prove the possibility of an amalgamation of water and air. Is it not a simpler and more credible supposition that only water or air, as the case may be, enters into the composition of any given object? But if any one still persists in maintaining this permutation of the elements (which, after all, would only mean that all things consist of air) -- let me ask the humble question --- by the activity of what agent they are so transmuted? Moreover, one would also be glad to enquire what is the use of this permutation of earth into water, and of water into air? What can earth converted into water, or water converted into air, perform, that could not be just as well accomplished by simple unchanged water or air? Surely, Nature does nothing in vain: I but here would be a difficult and wasteful process of transmutation constantly going on, which is not calculated to serve any useful purpose whatsoever. If it be said that earth rarefied into water is like water, yet not exactly water, my answer is that this is a mere quibble about words, and that if the rarefied earth is only like water, and not really water, it cannot possibly combine with it in its smallest particles; so nothing is gained by this hypothesis. Hence we may conclude that all things derive their origin from one element, which can be neither earth nor air. This I could prove at great length if I were not cramped for space. It follows, then, that water must be the first principle of all things, *i.e.*, of all concrete bodies in this world; earth is the fundamental element in which all bodies grow and are preserved; air is the medium into which they grow, and by means of which the celestial virtues are communicated to them. The seed of all things has been placed by God in water. This seed some exhibit openly, like vegetables, some keep in their kidneys, like animals; some conceal in the depths of their essential being, like metals. The seed is stirred into action by its form (*i.e.*, a certain appropriate celestial influence) coagulates the material water, and passes through a series of fermentative processes (fermentation being the principle of all transmutation), until it has produced that for the production of which it was specially suited. If the seed is metallic, there; generated from it first a dry liquid, which does not wet the hand *viz.*, Mercury, the mother of all metals. Mercury may be described as the true first matter of metals; for not until the elemental water has become Mercury can it be affirmed with any degree of certainty that a metal or mineral must result from it. Water is, in itself, potentially the seed of either an animal vegetable, or mineral; but Mercury is metallically differentiated water, *i.e.*, it is water passed into that stage of development, in which it can no longer produce anything but mineral substances. Mercury, then, is the common seed of gold, silver, copper, tin iron, lead, etc.; their difference is only to be sought in the degree of their digestion. The digestive is not any fat sulphur which is brought to bear on them from without; but Mercury contains within itself the active principle of its development, *viz.*, the inward heat due to celestial influences, causing vitality, and dependent on the fitness of the womb. These heavenly influences are at work throughout the world; but their exact mode of action is determined by the potential nature of the seed; if the inward life be metallic, the course of its development by means of outward agents will also be metallic. Still Mercury develops only where these outward influences (celestial and terrestrial) can be brought to bear. In every other place it will appear a cold, dead, and lifeless substance. But in the centre of its nativity it is quickened by the action of celestial influences, conveyed to it through the medium of air, whence

results heat, wherewith life is necessarily associated. Now, the womb in which this Mercury is placed, is either more, less, or not at all suited to it; and according to the different degrees of this fitness, the substance either remains altogether stationary, or is more or less perfectly developed; imperfection of development yields the imperfect metals, while by means of perfect development are produced silver and gold; but all metals, though differentiated by the degree of their digestion or maturity, have the same first substance, *viz.*, Mercury. The dross and impurities which are largely found in the base metals, form no part of the original Mercury but are added afterwards through some flaw in the process of coagulation, or through the impurity of the place or womb in which their metallic generation (fermentation) takes place. But I will now go on to deal with the special subject of this Treatises, *viz.*, . the renovation or multiplication of gold and silver.

---

## Chapter III

### **Of the Generation of Gold and Silver from the Mercurial Substance, and the Possibility of bringing Imperfect Metals to the same State of Perfection**

To the aforesaid source (Mercury) we trace the birth of gold, and of its sister, silver; they represent this substance brought to perfection by means of digestion. Perfection is of two kinds, inchoative or complete, partial or entire. Complete perfection (the complete digestion of all crudities and elimination of all impurities) is the ultimate aim of Nature; and she has reached it in our gold, which with its brilliancy lights up the whole earth. Inchoative perfection may be so named, not absolutely but relatively, when compared with essentially imperfect bodies. Those bodies are formally or essentially imperfect in the composition of which the impure predominates over the pure, so that they could never of themselves (by natural development attain perfection; this is the case with all metals except gold and silver. But whenever the pure is freed from the corruptive tyranny of the impure, and obtains the mastery over it, we have inchoative perfection, though the development of the body may be still incomplete. These crudities and impurities do not originally belong to the metallic substance, and are very well capable of being separated from it; if they are so purged off before coagulation, we get a perfect metal. But even if they are coagulated together with the Mercury, it is still possible to separate them from it, and thus to perfect the Mercury. It is on this possibility that our Art is based; and its business is to perform this separation. The base metals contain the same mercury as gold; if we can free this Mercury from the impurities which hinder its development, it must also go on to perfection, *i.e.*, become gold. If we could find some separating agent which would perform this office for the impure minerals, it would also be a digestive, *i.e.*, it would quicken the inward metallic digestion of the long-entombed Mercury. Such a separant is our divine Arcanum, which is the heavenly spirit of water with fiery penetrative power. Compared with common gold, it is what the soul is in comparison of the body; and having attained the highest degree of corporeal fixity, it takes up the Mercury of the base metals into its own nature, and protects it from the fire while the impurities are being burnt up. The Mercury of the base metals (unlike the Mercury of gold), if exposed to the fire without such protection, would not be able to encounter the searching ordeal, but (having no cohesion with its impure body and possessing no fixity in itself) would simply evaporate, and leave the impurities to be burned. But our Arcanum, being both a spiritual and a homogeneous substance, is capable of entering into a perfect atomic union with the imperfect metals, of taking up into its own nature that which is like to it, and of imparting to this Mercury its own fixity, and protecting it from the fire, so when the fire has burnt up all the impurities, that which is left is, of course, pure gold or silver, according to the quality of the Medicine -- which from that time forward is (like all other gold and silver) capable of resisting the most searching ordeal. So you see we do not, as is sometimes said, profess to create gold and silver, but only to find an agent which --- on account of its homogeneity and spirituality --- is capable of entering into an intimate (atomic) and maturing union with the Mercury of the base metals. And we contend that our Elixir is calculated, by the intense degree of its fixity and colour, to impart these qualities to any homogeneous substance which does not possess them.

---

## Chapter IV

### Of the Seed of Gold; and Whether Other Metals have Seed

Seed is the means of generic propagation given to all perfect things here below; it is the perfection of each body; and anybody that has no seed must be regarded as imperfect. Hence there can be no doubt that there is such a thing as metallic seed. If metals have seed, they certainly do not lose it in coagulation, which is the effect of perfection (or rather of perfect conditions). Now, in all seed-bearing things maturity means the perfect development of the seeds, and it stands to reason that metallic seed is therefore most certainly not destroyed by coagulation (the maturing process). If it be asked whether all metals have seed, my answer is, that the seed of all metals is the same; but that in some it is found nearer to, and in some further from the surface. All metallic seed is the seed of gold; for gold is the intention of Nature in regard to all metals. If the base metals are not gold, it is only through some accidental hindrance; they are all potentially gold. But, of course, this seed of gold is most easily obtainable from well-matured gold itself. Hence it would be lost labour to endeavour to obtain it from tin or lead by some laborious process, when it may be more readily obtained from gold itself. Remember that I am now speaking of metallic seed, and not of Mercury. Lead is to be multiplied, not in lead, but only in gold; for only when it attains its maturity as gold can its seed become fruitful. It may be admitted that silver has its own seed, as there is a white (as well as a red) multiplicative Tincture. Still, the White Tincture is really contained in the Red; and the seed of silver is nothing but a modification of that of gold. The whiteness of silver is the first degree of perfection, the yellowness of gold is the second, or highest degree. For the mother of our Stone (the silver of the Sages) is white, and imparts its whiteness to our gold, whence the offspring of these two parents first becomes white, like its mother, and then red with the royal blood of its father.

---

## Chapter V

### Of the Virtue of Golden Seed, and Where it is Most Readily Found

In order that we may obtain this means of perfecting imperfect metals, we must remember that our Arcanum is gold exalted to the highest degree of perfection to which the combined action of Nature and Art can develop it. In gold, Nature has reached the term of her efforts; but the seed of gold is something more perfect still, and in cultivating it we must, therefore, call in the aid of Art. The seed of metals is hidden out of sight still more completely than that of animals; nevertheless, it is within the compass of our Art to extract it. The seed of animals and vegetables is something separate, and may be cut out, or otherwise separately exhibited; but metallic seed is diffused throughout the metal, and contained in all its smallest parts, neither can it be discerned from its body: its extraction is therefore a task which may well tax the ingenuity of the most experienced philosopher; the virtues of the whole metal have to be intensified, so as to convert it into the sperm of our seed, which, by circulation, receives the virtues of superiors and inferiors, then next becomes wholly form, or heavenly virtue, which can communicate this to others related to it by homogeneity of matter. In respect of the Stone, the whole of gold is its substance. The place in which the seed resides is --- approximately speaking --- water; for, to speak properly and exactly, the seed is the smallest part of the metal, and is invisible; but as this invisible presence is diffused throughout the water of its kind, and exerts its virtue therein, nothing being visible to the eye but water, we are left to conclude from rational induction that this inward agent (which is, properly speaking, the seed) is really there. Hence we call the whole of the water seed, just as we call the whole of the grain seed, though the germ of life is only a smallest particle of the grain. But the seminal life is not distinct from the remaining substance of metals; rather, it is inseparably mingled with the smallest parts of the body. Roughly speaking, however, we describe the whole of our golden water as the seed of gold, because this seminal virtue pervades it in a most subtle manner. This seminal virtue the ancient Sages called the hidden ferment, the poison, or the invisible fire; again, they said that it was fire, or that fire resided in the water; they distinguished between soul and spirit, of which the former is the medium, the latter the active virtue. If anyone wonders that we describe water as the seat of the seed, or the seminal spirit, let him remember that in the beginning the Spirit of God moved on the face of the waters, *i.e.*, penetrated them with His heavenly quickening power. Thus, from the very first day of Creation, water has been the source and element of all things. For water alone contains the seeds of all things; yet in vegetables they are put forth in crude air; in animals they are preserved in the kidneys; while in minerals they are diffused throughout the whole substance; nevertheless, seed can never leave its original seat (*i.e.*, water). Things are preserved by that from which they derive their origin; for the cause of their origin being removed, the things which are the effect must also cease to exist; hence the multiplication and nutrition of all things is in water and through water. Vegetables are generated and nourished by the aqueous Teffas of the earth; animals by the liquid chyle; metals by the mercurial liquid. Animals preserve their seed in their kidneys, and in due time project it into the proper womb, where it is first moulded into a tender and very compacted foetus; this fetus is nourished by the liquid female menstruum, and thus grows until the time comes for it to be born. Then it is nourished with milk until it can bear stronger food; but this solid food does not become real nutriment until the stomach has converted it into a liquid chyle (as, for instance, bones in the stomach of the dog). In the same way the metals keep their perfect seed where it cannot be

seen; but even there it is preserved in water. Thence the Artist extracts it, puts it into its own proper womb, where it is cherished and grows, until (by means of corruption) it attains to its glorification. This is a most difficult operation, because the Metals, in which the seed is hidden, are so firmly and tightly compacted, and will not yield to violence, but only to a gentle and exquisitely subtle chemical process. Then I say to you, that there is a womb into which the gold (if placed therein) will, of its own accord, emit its seed, until it is debilitated and dies, and by its death is renewed into a most glorious King, who thenceforward receives power to deliver all his brethren from the fear of death.

---

## Chapter VI

### Of the Mode and Means of Extracting this Seed

That the most beautiful things are the most difficult to produce is the experience of all mankind; and it is not to be wondered at, therefore, that the most glorious of sublunary operations is attended with a very great amount of difficulty. If any student of this Art is afraid of hard work, let him stop with his foot upon the threshold. When, indeed, the Father of Lights has entrusted the Key of the Art to any man, that which remains to be done is mere child's play; his eyes are ravished with the sight of the most glorious signs, until the time of harvest arrives. Without this, error and vexation will be the result. Therefore the wise man, before commencing the work, will be chiefly solicitous of knowing it by its marks. Let the sons of knowledge learn that the great object of our Art is the manifestation of the hidden seed of gold, which can be effected only by full and perfect volatilisation of that which is fixed, and the subsequent corruption of its particular form. To break up gold in this way is the most profound secret in the world. It is not brought about by corrosive depravation of the metal, nor by the usual method of dissolution, but by our philosophical solution of the metal into mercurial water, by means of a previous mercurial calcination (made by means of the agent ), which is produced through the subtle rotation and conversion of the elements; this calcination, again, is a mortification of our homogeneous liquid with the dry element belonging to it; afterwards the dry is so far revived by means of this same liquid, that the perfectly matured virtue, extracted from the substance by the solvent, is the cause of this calcination and solution. Here, then, there is no room for the action of a corrosive. Gold, which is the most solid, strong, fire-proof, and fixed of all substances, is to be volatilised, and no mere corrosive will accomplish such a perfect change of nature. The mighty agent required for this purpose must be homogeneous, amicable, and spiritual, i.e., it must be akin to the body (of gold), and yet strong enough to overcome it; and penetrate to its very core, still leaving each smallest part of the gold true gold. Gold does not easily give up its nature, and will fight for its life, but our agent is strong enough to overcome and kill it, and then it also has power to restore it to life, and to change the lifeless remains into a new pure body.

---

## Chapter VII

### Of the First Agent or Womb, into Which our Seed should be Emitted and Where it is Matured

There remains to be found an Agent, by means of which the aforesaid operation may be performed. For this purpose we require a homogeneous water. For we have seen that the seed Of gold is concealed, and can remain effectual only in water, and this water must be homogeneous with the body, or else it could not penetrate all the thick integuments by means of which this seed is secured. For like generates like, that is to say, every agent that exercises a generative action upon anything, transmutes it (as far as possible) into its own nature. The Agent then must be akin to the body which is to be dissolved, and, moreover, perfectly pure from all dross or alloy. Again, whereas gold is fixed and solid, the Agent must be highly volatile and spiritual; gold is thick and gross, our Agent is subtle gold is dead our Agent is living and life-giving: in short, our Agent should have all those qualities which gold has not, and which it is to impart to the gold. Hence we conclude that Mercury alone is the true Key of our Art; for it is in truth the dry water described by the Sages, which, though liquid, does not wet the hands, nor anything else that does not belong to the unity of its substance. Mercury is our doorkeeper, our balm, our honey, oil, urine, may-dew, mother, egg, secret furnace, oven, true fire, venomous Dragon, Theriac, ardent wine, Green Lion, Bird of Hermes, Goose of Hermogenes, two-edged sword in the hand of the (Cherub that guards the Tree of Life, &c., &c.; it is our true, secret vessel, and the Garden of the Sages, in which our Sun rises and sets. It is our Royal Mineral, our triumphant vegetable Saturnia, and the magic rod of Hermes, by means of which he assumes any shape he likes. It is of this water that the Sage uses the words: "Let Alchemists boast as much as they like, but without this water the transmutation of metals is impossible. In Nature it is not such as we use it in our Art; it is a most common thing, and yet the most precious treasure of all the world... Therefore, Son of Knowledge, pay diligent heed to my words: Take that which in itself is most impure, the strumpet woman, purge it radically of all its uncleanness, and extract from it that which is most pure, namely, our menstruum (solvent), the Royal Diadem." Behold, I have told you in a few words that which ennobles the Sage, delivers him from error, and leads him to the most beautiful meadow of delights... The Arcanum which we seek is nothing but gold exalted to its highest degree of perfection, through the operation of Nature assisted by our Art. When the sperm hidden in the body of gold is brought out by means of our Art, it appears under the form of Mercury, whence it is exalted into the quintessence which is first white, and then, by means of continuous coction becomes red. All this is the work of our homogeneous Agent our Mercurial Ponticum, which is pure crystalline without transparency, liquid without humectation, and, in short, the true Divine water, which is not found above-ground, but is prepared by the hand of the Sage, with the cooperation of Nature, which we know, have seen, have made, and still possess which also we desire to make known to the true students of our Art, while it is our wish to hide it only from the unworthy.

---

## Chapter VIII

### Concerning the Genealogy of the Mercury of the Sages, its Origin, Birth, and the Signs which Precede and Accompany It

Some boastful and arrogant sophists, who have read in books that our Mercury is not common Mercury, and who know that it is called by different names, do not blush to come forward as pretenders to a knowledge of this Art, and take upon themselves to describe this solvent as diaphanous and limpid, or as a metallic gum which is permiscible with metals, though they do not in reality know anything whatsoever about it. The same may be said of those who would extract our Mercury from herbs or other still more fantastic substances. These gentry know not why the Sages do not use Mercury such as is sold by apothecaries as their substance. They are aware of the fact, but are unacquainted with its causes; and the consequence is the idea which they have that anything which changes the nature of common Mercury, will convert it into that of the Sages. But in regard to these foolish persons, I have already expressed our opinion... All metals, as I demonstrated in the second chapter, have the same substantial principle, viz., Mercury. From this proposition it follows that the substance of common Mercury is homogeneous with that of all the other metals, and if the Mercury of the Sages be the homogeneous metallic water, it can differ from common Mercury only in respect of its purity and heat. The first substance of common Mercury is that of all other metals, viz., our Mercury. So long as it remains in the veins of the earth, in a place perfectly adapted to its generation, and is sheltered from crude air, it retains its inward movement and heat, which are the cause of all metallic development. But if it be marred by any accident, or if the place become unfit for it, the inward movement is stopped, and the germinal life chilled like that of an egg which a hen has left after sitting on it for some time. This is the reason why those who have attempted to digest common Mercury by means of artificial heat have failed as ludicrously as any one who should endeavour to incubate artificially an addled egg. The difference between the egg and the metal is that our Art is capable of making good the damage, but not by artificial means. We have a crude, undigested, frigid, unmatured metallic mass, which wants the form of our Mercury, for which it must exchange its own, if it is to become that which we seek. With this end in view, its deficiencies are twofold; its nature is clogged with superfluous foreign matter, and it does not possess the requisite spiritual virtue. Its superfluities consist of earthy leprosy, and aqueous dropsy. Its deficiency is one of true sulphureous heat, by means of which it would be enabled to purge off these superfluities. Water, indeed, is the womb, but no womb can receive a vital germ without warmth. Supplement your (common) Mercury, therefore, with the inward fire which it needs, and it will soon get rid of all superfluous dross. If you can do this, you have accomplished the great feat of the Sages. Jupiter has recovered his empire; the black clouds of Saturn are dispersed, and the sparkling fountain wells forth clear and pure. This substance will dissolve gold by means of a true philosophical solution, which is as different as can be from that foolish use of corrosives which only destroy the metallic nature. This Mercury (with) gold and silver naturally produces the Arcanum, or potable gold, as all adepts know and can testify.

Here I conclude this Tract, as all that remains to be said is set forth in a special (the next) Treatise.

---

## NEW ATLANTIS.

---

WE sailed from Peru, (where we had continued by the space of one whole year,) for China and Japan, by the South Sea;<sup>1</sup> taking with us victuals for twelve months; and had good winds from the east, though soft and weak, for five months' space and more. But then the wind came about, and settled in the west for many days, so as we could make little or no way, and were sometimes in purpose to turn back. But then again there arose strong and great winds from the south, with a point east; which carried us up (for all that we could do) towards the north: by which time our victuals failed us, though we had made good spare of them. So that finding ourselves in the midst of the greatest wilderness of waters in the world, without victual, we gave ourselves for lost men, and prepared for death. Yet we did lift up our hearts and voices to God above, who *showeth his wonders in the deep*; beseeching him of his mercy, that as in the beginning he discovered<sup>2</sup> the face of the deep, and

<sup>1</sup> The words "by the South Sea" are omitted in the translation.

<sup>2</sup> So in the original. If *discovered* be the right word, it must mean *removed the covering of* the face of the deep. But I think there must be some mistake. The Latin version has *quemadmodum in principio congregationes aquarum mandavit et Aridam apparere fecit*. The allusion is, no doubt, to Genes. i. 9.: "Let the waters under the heaven be gathered together unto one place, and let the dry land appear."

brought forth dry land, so he would now discover land to us, that we might<sup>1</sup> not perish. And it came to pass that the next day about evening, we saw within a kenning before us, towards the north, as it were thick clouds, which did put us in some hope of land; knowing how that part of the South Sea was utterly unknown; and might have islands or continents, that hitherto were not come to light. Wherefore we bent our course thither, where we saw the appearance of land, all that night; and in the dawning of the next day, we might plainly discern that it was a land; flat to our sight, and full of boscage; which made it shew the more dark. And after an hour and a half's sailing, we entered into a good haven, being the port of a fair city; not great indeed, but well built, and that gave a pleasant view from the sea:<sup>2</sup> and we thinking every minute long till we were on land, came close to the shore, and offered to land. But straightways we saw divers of the people, with bastons in their hands, as it were forbidding us to land; yet without any cries or fierceness, but only as warning us off by signs that they made. Whereupon being not a little discomforted, we were advising with ourselves what we should do. During which time there made forth to us a small boat, with about eight persons in it; whereof one of them had in his hand a tipstaff of a yellow cane, tipped at both ends with blue, who came aboard our ship, without any show of distrust at all. And when he saw one of our number present himself somewhat afore the rest, he drew forth a little scroll of parchment,

<sup>1</sup> *mought* in the original; a form of the word frequently, though not uniformly, adopted by Bacon. I have always substituted *might*.

<sup>2</sup> *ex qua parte Mare spectabat, elegantiam magnam præ se tulit.* — *Lat vers.*

(somewhat yellower than our parchment, and shining like the leaves of writing tables, but otherwise soft and flexible,) and delivered it to our foremost man. In which scroll were written in ancient Hebrew, and in ancient Greek, and in good Latin of the School, and in Spanish, these words ; “ Land ye not, none of you ; and provide to be gone from this coast within sixteen days, except you have further time given you. Meanwhile, if you want fresh water, or victual, or help for your sick, or that your ship needeth repair, write down your wants, and you shall have that which belongeth to mercy.” This scroll was signed with a stamp of cherubins’ wings, not spread but hanging downwards, and by them a cross. This being delivered, the officer returned, and left only a servant with us to receive our answer. Consulting hereupon amongst ourselves, we were much perplexed. The denial of landing and hasty warning us away troubled us much ; on the other side, to find that the people had languages and were so full of humanity, did comfort us not a little. And above all, the sign of the cross to that instrument was to us a great rejoicing, and as it were a certain presage of good. Our answer was in the Spanish tongue ; “ That for our ship, it was well ; for we had rather met with calms and contrary winds than any tempests. For our sick, they were many, and in very ill case ; so that if they were not permitted to land, they ran danger of their lives.” Our other wants we set down in particular ; adding, “ that we had some little store of merchandise, which if it pleased them to deal for, it might supply our wants without being chargeable unto them.” We offered some reward in pistolets unto the servant, and a piece of crimson velvet to

be presented to the officer ; but the servant took them not, nor would scarce look upon them ; and so left us, and went back in another little boat which was sent for him.

About three hours after we had dispatched our answer, there came towards us a person (as it seemed) of place. He had on him a gown with wide sleeves, of a kind of water chamolet, of an excellent azure colour, far more glossy than ours ; his under apparel was green ; and so was his hat, being in the form of a turban, daintily made, and not so huge as the Turkish turbans ; and the locks of his hair came down below the brims of it. A reverend man was he to behold. He came in a boat, gilt in some part of it, with four persons more only in that boat ; and was followed by another boat, wherein were some twenty. When he was come within a flight-shot<sup>1</sup> of our ship, signs were made to us that we should send forth some to meet him upon the water ; which we presently did in our ship-boat, sending the principal man amongst us save one, and four of our number with him. When we were come within six yards of their boat, they called to us to stay, and not to approach farther ; which we did. And thereupon the man whom I before described stood up, and with a loud voice in Spanish, asked, "Are ye Christians?" We answered, "We were ;" fearing the less, because of the cross we had seen in the subscription. At which answer the said person lifted up his right hand towards heaven, and drew it softly to his mouth, (which is the gesture

<sup>1</sup> *spiculi jactum*. When archers try which can shoot furthest, they call it flight-shooting. The distance would be between 200 and 300 yards. Old Double, according to Justice Shallow, would have "carried you a forehand shaft a fourteen and fourteen and half;" that is, 284 or 294 yards. See Hen. IV. Part II. act 3. sc. 2.

they use when they thank God,) and then said: "If ye will swear (all of you) by the merits of the Saviour that ye are no pirates, nor have shed blood lawfully nor unlawfully within forty days past, you may have licence to come on land." We said, "We were all ready to take that oath." Whereupon one of those that were with him, being (as it seemed) a notary, made an entry of this act. Which done, another of the attendants of the great person, which was with him in the same boat, after his lord had spoken a little to him, said aloud; "My lord would have you know, that it is not of pride or greatness that he cometh not aboard your ship; but for that in your answer you declare that you have many sick amongst you, he was warned by the Conservator of Health of the city that he should keep a distance." We bowed ourselves towards him, and answered, "We were his humble servants; and accounted for great honour and singular humanity towards us that which was already done; but hoped well that the nature of the sickness of our men was not infectious." So he returned; and a while after came the notary to us aboard our ship; holding in his hand a fruit of that country, like an orange, but of colour between orange-tawney and scarlet, which cast a most excellent odour. He used it (as it seemeth) for a preservative against infection. He gave us our oath; "By the name of Jesus and his merits:" and after told us that the next day by six of the clock in the morning we should be sent to, and brought to the Strangers' House, (so he called it,) where we should be accommodated of things both for our whole and for our sick. So he left us; and when we<sup>1</sup> offered him

<sup>1</sup> So ed. 1635. Ed. 1629 has *he*.

some pistolets, he smiling said, "He must not be twice paid for one labour:" meaning (as I take it) that he had salary sufficient of the state for his service. For (as I after learned) they call an officer that taketh rewards, *twice paid*.

The next morning early, there came to us the same officer that came to us at first with his cane, and told us, "He came to conduct us to the Strangers' House; and that he had prevented the hour, because we might have the whole day before us for our business. For," said he, "if you will follow my advice, there shall first go with me some few of you, and see the place, and how it may be made convenient for you; and then you may send for your sick, and the rest of your number which ye will bring on land." We thanked him, and said, "That this care which he took of desolate strangers God would reward." And so six of us went on land with him: and when we were on land, he went before us and turned to us, and said,<sup>1</sup> "He was but our servant and our guide." He led us through three fair streets; and all the way we went there were gathered some people on both sides standing in a row; but in so civil a fashion, as if it had been not to wonder at us<sup>2</sup> but to welcome us; and divers of them, as we passed by them, put their arms a little abroad; which is their gesture when they bid any welcome. The Strangers' House is a fair and spacious house, built of brick, of somewhat a bluer colour than our brick; and with handsome windows, some of glass, some of a kind of cambric oiled. He brought us first into a fair parlour above stairs, and

<sup>1</sup> *et dixit, per humanè certè, &c.*

<sup>2</sup> *ut viderentur non tam ad otiosum spectaculum convenisse quam &c.*

then asked us, "What number of persons we were? And how many sick?" We answered, "We were in all (sick and whole) one and fifty persons, whereof our sick were seventeen." He desired us to have patience a little, and to stay till he came back to us; which was about an hour after; and then he led us to see the chambers which were provided for us, being in number nineteen: they having cast it (as it seemeth) that four of those chambers, which were better than the rest, might receive four of the principal men of our company, and lodge them alone by themselves; and the other fifteen chambers were to lodge us two and two together. The chambers were handsome and cheerful chambers, and furnished civilly. Then he led us to a long gallery, like a dorture,<sup>1</sup> where he showed us all along the one side (for the other side was but wall and window) seventeen cells, very neat ones, having partitions of cedar wood. Which gallery and cells, being in all forty, (many more than we needed,) were instituted as an infirmary for sick persons. And he told us withal, that as any of our sick waxed well, he might be removed from his cell to a chamber; for which purpose there were set forth ten spare chambers, besides the number we spake of before. This done, he brought us back to the parlour, and lifting up his cane a little, (as they do when they give any charge or command,<sup>2</sup>) said to us, "Ye are to know that the custom of the land requireth, that after this day and to-morrow, (which we give you for removing of your people from your ship,) you are to keep within doors

<sup>1</sup> Dormitory. The Latin translation has, *qualia solent esse dormitoria monachorum.*

<sup>2</sup> *i. e.*, any charge which they have received from superior authority -- (*quod in more illis erat quoties ministri mandata superiorum referunt*).

for three days. But let it not trouble you, nor do not think yourselves restrained, but rather left to your rest and ease. You shall want nothing, and there are six of our people appointed to attend you, for any business you may have abroad." We gave him thanks with all affection and respect, and said, "God surely is manifested in this land." We offered him also twenty pistolets; but he smiled, and only said; "What? twice paid!" And so he left us. Soon after our dinner was served in; which was right good viands, both for bread and meat:<sup>1</sup> better than any collegiate diet that I have known in Europe. We had also drink of three sorts, all wholesome and good; wine of the grape; a drink of grain, such as is with us our ale, but more clear; and a kind of cider made of a fruit of that country; a wonderful pleasing and refreshing drink. Besides, there were brought in to us great store of those scarlet oranges for our sick; which (they said) were an assured remedy for sickness taken at sea. There was given us also a box of small grey or whitish pills, which they wished our sick should take, one of the pills every night before sleep; which (they said) would hasten their recovery. The next day, after that our trouble of carriage and removing of our men and goods out of our ship was somewhat settled and quiet, I thought good to call our company together; and when they were assembled said unto them; "My dear friends, let us know ourselves, and how it standeth with us. We are men cast on land, as Jonas was out of the whale's belly, when we were as buried in the deep: and now we are on land, we are but between

<sup>1</sup> The translation has both for meat and *drink*; *tam respectu ciborum quam potus*: and in the next line but one, *Potus erat trium generum, &c.*

death and life; for we are beyond both the old world and the new; and whether ever we shall see Europe, God only knoweth. It is a kind of miracle hath brought us hither: and it must be little less that shall bring us hence. Therefore in regard of our deliverance past, and our danger present and to come, let us look up to God, and every man reform his own ways. Besides we are come here amongst a Christian people, full of piety and humanity: let us not bring that confusion of face upon ourselves, as to show our vices or unworthiness before them. Yet there is more. For they have by commandment (though in form of courtesy) cloistered us within these walls for three days: who knoweth whether it be not to take some taste of our manners and conditions? and if they find them bad, to banish us straightways; if good, to give us further time. For these men that they have given us for attendance may withal have an eye upon us. Therefore for God's love, and as we love the weal of our souls and bodies, let us so behave ourselves as we may be at peace with God, and may find grace in the eyes of this people." Our company with one voice thanked me for my good admonition, and promised me to live soberly and civilly, and without giving any the least occasion of offence. So we spent our three days joyfully and without care, in expectation what would be done with us when they were expired. During which time, we had every hour joy of the amendment of our sick; who thought themselves cast into some divine pool of healing, they mended so kindly and so fast.

The morrow after our three days were past, there came to us a new man that we had not seen before,

clothed in blue as the former was, save that his turban was white, with a small red cross on the top. He had also a tippet of fine linen. At his coming in, he did bend to us a little, and put his arms abroad. We of our parts saluted him in a very lowly and submissive manner; as looking that from him we should receive sentence of life or death. He desired to speak with some few of us: whereupon six of us only stayed, and the rest avoided the room. He said, "I am by office governor of this House of Strangers, and by vocation I am a Christian priest; and therefore am come to you to offer you my service, both as strangers and chiefly as Christians. Some things I may tell you, which I think you will not be unwilling to hear. The state hath given you licence to stay on land for the space of six weeks; and let it not trouble you if your occasions ask further time, for the law in this point is not precise; and I do not doubt but myself shall be able to obtain for you such further time as may be convenient. Ye shall also understand, that the Strangers' House is at this time rich, and much aforehand; for it hath laid up revenue these thirty-seven years; for so long it is since any stranger arrived in this part: and therefore take ye no care; the state will defray you all the time you stay; neither shall you stay one day the less for that. As for any merchandise ye have brought, ye shall be well used, and have your return either in merchandise or in gold and silver: for to us it is all one. And if you have any other request to make, hide it not. For ye shall find we will not make your countenance to fall by the answer ye shall receive. Only this I must tell you, that none of you must go above a *karan*" (that is with them a mile and

an half) "from the walls of the city, without especial leave." We answered, after we had looked awhile one upon another admiring this gracious and parent-like usage; "That we could not tell what to say: for we wanted words to express our thanks; and his noble free offers left us nothing to ask. It seemed to us that we had before us a picture of our salvation in heaven; for we that were awhile since in the jaws of death, were now brought into a place where we found nothing but consolations. For the commandment laid upon us, we would not fail to obey it, though it was impossible but our hearts should be inflamed to tread further upon this happy and holy ground." We added; "That our tongues should first cleave to the roofs of our mouths, ere we should forget either his reverend person or this whole nation in our prayers." We also most humbly besought him to accept of us as his true servants, by as just a right as ever men on earth were bounden; laying and presenting both our persons and all we had at his feet. He said; "He was a priest, and looked for a priest's reward: which was our brotherly love and the good of our souls and bodies." So he went from us, not without tears of tenderness in his eyes; and left us also confused with joy and kindness, saying amongst ourselves, "That we were come into a land of angels, which did appear to us daily and prevent us with comforts, which we thought not of, much less expected."

The next day, about ten of the clock, the governor came to us again, and after salutations said familiarly, "That he was come to visit us:" and called for a chair, and sat him down: and we, being some ten of us, (the rest were of the meaner sort, or else gone

abroad,) sat down with him. And when we were set, he began thus: "We of this island of Bensalem," (for so they call it in their language,) "have this; that by means of our solitary situation, and of the laws of secrecy which we have for our travellers, and our rare admission of strangers, we know well most part of the habitable world, and are ourselves unknown. Therefore because he that knoweth least is fittest to ask questions, it is more reason, for the entertainment of the time, that ye ask me questions, than that I ask you." We answered; "That we humbly thanked him that he would give us leave so to do: and that we conceived by the taste we had already, that there was no worldly thing on earth more worthy to be known than the state of that happy land. But above all," (we said,) "since that we were met from the several ends of the world, and hoped assuredly that we should meet one day in the kingdom of heaven, (for that we were both parts Christians,) we desired to know (in respect that land was so remote, and so divided by vast and unknown seas, from the land where our Saviour walked on earth,) who was the apostle of that nation, and how it was converted to the faith?" It appeared in his face that he took great contentment in this our question: he said, "Ye knit my heart to you, by asking this question in the first place; for it sheweth that you *first seek the kingdom of heaven*; and I shall gladly and briefly satisfy your demand.

"About twenty years after the ascension of our Saviour, it came to pass that there was seen by the people of Renfusa, (a city upon the eastern coast of our island,) within night, (the night was cloudy and

alm,) as it might be some mile into the sea, a great pillar of light; not sharp, but in form of a column or cylinder, rising from the sea a great way up towards heaven: and on the top of it was seen a large cross of light, more bright and resplendent than the body of the pillar. Upon which so strange a spectacle, the people of the city gathered apace together upon the sands, to wonder; and so after put themselves into a number of small boats, to go nearer to this marvellous sight. But when the boats were come within about sixty yards of the pillar, they found themselves all bound, and could go no further; yet so as they might move to go about, but might not approach nearer: so as the boats stood all as in a theatre, beholding this light as an heavenly sign.<sup>1</sup> It so fell out, that there was in one of the boats one of the wise men of the society of Salomon's House; which house or college (my good brethren) is the very eye of this kingdom; who having awhile attentively and devoutly viewed and contemplated 'this pillar and cross, fell down upon his face; and then raised himself upon his knees, and lifting up his hands to heaven, made his prayers in this manner:

“ Lord God of heaven and earth, thou hast vouchsafed of thy grace to those of our order, to know thy works of creation, and the secrets of them; and to discern (as far as appertaineth to the generations of men) between divine miracles, works of nature, works of art, and impostures and illusions of all sorts.<sup>2</sup> I do here acknowledge and testify before this people, that the thing which we now see before our eyes is thy

<sup>1</sup> *tanquam scenam cœlestem*, in the translation.

<sup>2</sup> *illusiones demonum, cum imposturis omnimodis.*

Finger and a true Miracle ; and forasmuch as we learn in our books that thou never workest miracles but to a divine and excellent end, (for the laws of nature are thine own laws, and thou exceedest them not but upon great cause,) we most humbly beseech thee to prosper this great sign, and to give us the interpretation and use of it in mercy ; which thou dost in some part secretly promise by sending it unto us.’

“ When he had made his prayer, he presently found the boat he was in moveable and unbound ; whereas all the rest remained still fast ; and taking that for an assurance of leave to approach, he caused the boat to be softly and with silence rowed towards the pillar. But ere he came near it, the pillar and cross of light brake up, and cast itself abroad, as it were, into a firmament of many stars ; which also vanished soon after, and there was nothing left to be seen but a small ark or chest of cedar, dry, and not wet at all with water, though it swam. And in the fore-end of it, which was towards him, grew a small green branch of palm ; and when the wise man had taken it with all reverence into his boat, it opened of itself, and there were found in it a Book and a Letter ; both written in fine parchment, and wrapped in sindons of linen. The Book contained all the canonical books of the Old and New Testament, according as you have them, (for we know well what the Churches with you receive) ; and the Apocalypse itself,<sup>1</sup> and some other books of the New Testament which were not at that time written, were nevertheless in the Book. And for the Letter, it was in these words :

<sup>1</sup> The original has a semicolon after “ itself,” which would seem to connect this clause with the last. But the translation (*Apocalypsis ipsa*) shows that it was meant to be the beginning of a new sentence.

“ ‘ I Bartholomew, a servant of the Highest, and Apostle of Jesus Christ, was warned by an angel that appeared to me in a vision of glory, that I should commit this ark to the floods of the sea. Therefore I do testify and declare unto that people where God shall ordain this ark to come to land, that in the same day is come unto them salvation and peace and good-will, from the Father, and from the Lord Jesus.’ ”

“ There was also in both these writings, as well the Book as the Letter, wrought a great miracle, conform to that of the Apostles in the original Gift of Tongues. For there being at that time in this land Hebrews, Persians, and Indians, besides the natives, every one read upon the Book and Letter, as if they had been written in his own language. And thus was this land saved from infidelity (as the remain of the old world was from water) by an ark, through the apostolical and miraculous evangelism of St. Bartholomew.” And here he paused, and a messenger came, and called him from us. So this was all that passed in that conference.

The next day, the same governor came again to us immediately after dinner, and excused himself, saying, “ That the day before he was called from us somewhat abruptly, but now he would make us amends, and spend time with us, if we held his company and conference agreeable.” We answered, “ That we held it so agreeable and pleasing to us, as we forgot both dangers past and fears to come, for the time we heard him speak; and that we thought an hour spent with him, was worth years of our former life.” He bowed himself a little to us, and after we were set again, he said; “ Well, the questions are on your part.” One

of our number said, after a little pause; "That there was a matter we were no less desirous to know, than fearful to ask, lest we might presume too far. But encouraged by his rare humanity towards us, (that could scarce think ourselves strangers, being his vowed and professed servants,) we would take the hardiness to propound it: humbly beseeching him, if he thought it not fit to be answered, that he would pardon it, though he rejected it." We said; "We well observed those his words, which he formerly spake, that this happy island where we now stood was known to few, and yet knew most of the nations of the world; which we found to be true, considering they had the languages of Europe, and knew much of our state and business; and yet we in Europe (notwithstanding all the remote discoveries and navigations of this last age,) never heard any of the least inkling or glimpse of this island. This we found wonderful strange; for that all nations have inter-knowledge<sup>1</sup> one of another either by voyage into foreign parts, or by strangers that come to them: and though the traveller into a foreign country doth commonly know more by the eye, than he that stayeth at home can by relation of the traveller; yet both ways suffice to make a mutual knowledge, in some degree, on both parts. But for this island, we never heard tell of any ship of theirs that had been seen to arrive upon any shore of Europe; no, nor of either the East or West Indies; nor yet of any ship of any other part of the world that had made return from them. And yet the marvel rested not in this. For the situation of it (as his lordship said) in the secret conclave of such a vast sea might cause it. But

<sup>1</sup> *enterknowledge* in the original.

then that they should have knowledge of the languages, books, affairs, of those that lie such a distance from them, it was a thing we could not tell what to make of; for that it seemed to us a condition and propriety of divine powers and beings, to be hidden and unseen to others, and yet to have others open and as in a light to them." At this speech the governor gave a gracious smile, and said; "That we did well to ask pardon for this question we now asked; for that it imported as if we thought this land a land of magicians, that sent forth spirits of the air into all parts, to bring them news and intelligence of other countries." It was answered by us all, in all possible humbleness, but yet with a countenance taking knowledge that we knew that he spake it but merrily, "That we were apt enough to think there was somewhat supernatural in this island; but yet rather as angelical than magical. But to let his lordship know truly what it was that made us tender and doubtful to ask this question, it was not any such conceit, but because we remembered he had given a touch in his former speech, that this land had laws of secrecy touching strangers." To this he said; "You remember it aright; and therefore in that I shall say to you I must reserve some particulars, which it is not lawful for me to reveal;—but there will be enough left to give you satisfaction.

"You shall understand (that which perhaps you will scarce think credible) that about three thousand years ago, or somewhat more, the navigation of the world, (specially for remote voyages,) was greater than at this day. Do not think with yourselves that I know not how much it is increased with you within these six-score years: I know it well: and yet I say greater

then than now; whether it was, that the example of the ark, that saved the remnant of men from the universal deluge, gave men confidence to adventure upon the waters; or what it was; but such is the truth. The Phœnicians, and especially the Tyrians, had great fleets. So had the Carthaginians, their colony, which is yet further west. Toward the east, the shipping of Egypt and of Palestina was likewise great. China also, and the great Atlantis (that you call America), which have now but junks and canoes,<sup>1</sup> abounded then in tall ships. This island (as appeareth by faithful registers of those times) had then fifteen hundred strong ships, of great content. Of all this there is with you sparing memory, or none; but we have large knowledge thereof.

“At that time, this land was known and frequented by the ships and vessels of all the nations before named. And (as it cometh to pass) they had many times men of other countries, that were no sailors, that came with them; as Persians, Chaldeans, Arabians; so as almost all nations of might and fame resorted hither; of whom we have some stirps and little tribes with us at this day. And for our own ships, they went sundry voyages, as well to your Straits, which you call the Pillars of Hercules,<sup>2</sup> as to other parts in the Atlantic and Mediterrane Seas; as to Paguin<sup>3</sup>

<sup>1</sup> *Canoe's* in the original.

<sup>2</sup> Hercules is called by Edrisi Dhoulcarnain. He says he lived in the time of Abraham, and has been confounded with Iscander Dhoulcarnain, or Alexander the two-horned. That the limits beyond which it is impossible to pass were set up by Dhoulcarnain gives the obvious explanation of the passage in Chaucer's *Troilus and Cressida*:—

“I am tyl God me bettre mynde sende,  
At Dulcarnon, right at my wyte's end.”

“qui interpretes mire torsit.” — *R. L. E.*

<sup>3</sup> Peking. It seems as if Bacon supposed that Peking was a sea-port. — *L. E.* [The translation adds *civitatem in Chinâ antiquissimam.*]

(which is the same with Cambaline<sup>1</sup>) and Quinzy,<sup>2</sup> upon the Oriental Seas, as far as to the borders of the East Tartary.

“At the same time, and an age after, or more, the inhabitants of the great Atlantis did flourish.<sup>3</sup> For though the narration and description which is made by a great man with you, that the descendants of Neptune planted there; and of the magnificent temple, palace, city, and hill; and the manifold streams of goodly navigable rivers, (which, as so many chains, environed the same site and temple); and the several degrees of ascent whereby men did climb up to the same, as if it had been a *scala cœli*; be all poetical and fabulous: yet so much is true, that the said country of Atlantis, as well that of Peru, then called Coya, as that of Mexico, then named Tyrambel, were mighty and proud kingdoms in arms, shipping, and riches: so mighty, as at one time (or at least within the space of ten years) they both made two great expeditions; they of Tyrambel through the Atlantic to the Mediterranean Sea; and they of Coya through the South Sea upon this our island. And for the former of these, which was into Europe, the same author amongst you (as it seemeth) had some relation from the Egyptian priest whom he

<sup>1</sup> Cambalu is the reading of the common text of Marco Polo. The word is properly Khambalik. It is the Tartar name for Peking. — *R. L. E.* [It is *Cambalu* in the translation; and in the English Bacon probably wrote *Cambalue*. — *J. S.*]

<sup>2</sup> The Quinsai of Marco Polo, now Hanchowfoo. — *R. L. E.*

<sup>3</sup> See Plato, *Critias*, p. 113., and *Timæus*, p. 25. Everything relating to the story of Atlantis has been collected by Humboldt, *Examen critique de l'Histoire de la Géographie*, &c., i. p. 167. Compare Martin, *Etudes sur le Timée*; and see Gesenius, *Monumenta Phœnicia*, for an account of a spurious Phœnician inscription, purporting to give the history of the destruction of Atlantis. It may be a question whether there be not some affinity between Atlantis and Homer's Phœacia. — *R. L. E.*

citeth. For assuredly such a thing there was. But whether it were the ancient Athenians that had the glory of the repulse and resistance of those forces, I can say nothing: but certain it is, there never came back either ship or man from that voyage. Neither had the other voyage of those of Coya upon us had better fortune, if they had not met with enemies of greater clemency. For the king of this island (by name Altabin) a wise man and a great warrior, knowing well both his own strength and that of his enemies, handled the matter so, as he cut off their land-forces from their ships; and entailed both their navy and their camp with a greater power than theirs, both by sea and land; and compelled them to render themselves without striking stroke: and after they were at his mercy, contenting himself only with their oath that they should no more bear arms against him, dismissed them all in safety. But the Divine Revenge overtook not long after those proud enterprises. For within less than the space of one hundred years, the great Atlantis was utterly lost and destroyed: not by a great earthquake, as your man saith, (for that whole tract is little subject to earthquakes,) but by a particular deluge or inundation; those countries having, at this day, far greater rivers and far higher mountains to pour down waters, than any part of the old world. But it is true that the same inundation was not deep; not past forty foot, in most places, from the ground: so that although it destroyed man and beast generally, yet some few wild inhabitants of the wood<sup>1</sup> escaped. Birds also were saved by flying to the high trees and

<sup>1</sup> The translation says, of the *mountains: silvestres habitatores quidam montium.*

woods. For as for men, although they had buildings in many places higher than the depth of the water, yet that inundation, though it were shallow, had a long continuance; whereby they of the vale that were not drowned, perished for want of food and other things necessary. So as marvel you not at the thin population of America, nor at the rudeness and ignorance of the people; for you must account your inhabitants of America as a young people; younger a thousand years, at the least, than the rest of the world; for that there was so much time between the universal flood and their particular inundation. For the poor remnant of human seed which remained in their mountains peopled the country again slowly, by little and little; and being simple and savage people, (not like Noah and his sons, which was the chief family of the earth,) they were not able to leave letters, arts, and civility to their posterity; and having likewise in their mountainous habitations been used (in respect of the extreme cold of those regions) to clothe themselves with the skins of tigers, bears, and great hairy goats, that they have in those parts; when after they came down into the valley, and found the intolerable heats which are there, and knew no means of lighter apparel, they were forced to begin the custom of going naked, which continueth at this day. Only they take great pride and delight in the feathers of birds, and this also they took from those their ancestors of the mountains, who were invited unto it by the infinite flights of birds that came up to the high grounds, while the waters stood below. So you see, by this main accident of time, we lost our traffic with the Americans, with whom of all others, in regard they

lay nearest to us, we had most commerce. As for the other parts of the world, it is most manifest that in the ages following (whether it were in respect of wars, or by a natural revolution of time,) navigation did every where greatly decay; and specially far voyages (the rather by the use of galleys,<sup>1</sup> and such vessels as could hardly brook the ocean,) were altogether left and omitted. So then, that part of intercourse<sup>2</sup> which could be from other nations to sail to us, you see how it hath long since ceased; except it were by some rare accident, as this of yours. But now of the cessation of that other part of intercourse, which might be by our sailing to other nations, I must yield you some other cause. For I cannot say (if I shall say truly,) but our shipping, for number, strength, mariners, pilots, and all things that appertain to navigation, is as great as ever: and therefore why we should sit at home, I shall now give you an account by itself: and it will draw nearer to give you satisfaction to your principal question.

“There reigned in this island, about nineteen hundred years ago, a King, whose memory of all others we most adore; not superstitiously, but as a divine instrument, though a mortal man; his name was Sól-amona: and we esteem him as the lawgiver of our nation. This king had a *large heart*, inscrutable for good; and was wholly bent to make his kingdom and people happy. He therefore, taking into consideration how sufficient and substantive this land was to maintain itself without any aid at all of the foreigner; being five thousand six hundred miles in circuit, and

<sup>1</sup> *propterea quod triremes . . . in usum venire cœperunt.*

<sup>2</sup> *entercourse* in orig.

of rare fertility of soil in the greatest part thereof, and finding also the shipping of this country might be plentifully set on work, both by fishing and by transportations from port to port, and likewise by sailing unto some small islands that are not far from us, and are under the crown and laws of this state; and recalling into his memory the happy and flourishing estate wherein this land then was, so as it might be a thousand ways altered to the worse, but scarce any one way to the better; thought nothing wanted to his noble and heroical intentions, but only (as far as human foresight might reach) to give perpetuity to that which was in his time so happily established. Therefore amongst his other fundamental laws of this kingdom, he did ordain the interdicts and prohibitions which we have touching entrance of strangers; which at that time (though it was after the calamity of America) was frequent; doubting novelties, and commixture of manners. It is true, the like law against the admission of strangers without licence is an ancient law in the kingdom of China, and yet continued in use. But there it is a poor thing; and hath made them a curious, ignorant, fearful, foolish nation. But our lawgiver made his law of another temper. For first, he hath preserved all points of humanity, in taking order and making provision for the relief of strangers distressed; whereof you have tasted." At which speech (as reason was) we all rose up, and bowed ourselves. He went on. "That king also, still desiring to join humanity and policy together; and thinking it against humanity to detain strangers here against their wills, and against policy that they should return and discover their knowledge of this estate, he took this course: he did ordain

that of the strangers that should be permitted to land, as many (at all times) might depart as would ; but as many as would stay should have very good conditions and means to live from the state. Wherein he saw so far, that now in so many ages since the prohibition, we have memory not of one ship that ever returned ; and but of thirteen persons only, at several times, that chose to return in our bottoms. What those few that returned may have reported abroad I know not. But you must think, whatsoever they have said could be taken where they came but for a dream. Now for our travelling from hence into parts abroad, our Lawgiver thought fit altogether to restrain it. So is it not in China. For the Chinese sail where they will or can ; which sheweth that their law of keeping out strangers is a law of pusillanimity and fear. But this restraint of ours hath one only exception, which is admirable ; preserving the good which cometh by communicating with strangers, and avoiding the hurt ; and I will now open it to you. And here I shall seem a little to digress, but you will by and by find it pertinent. Ye shall understand (my dear friends) that amongst the excellent acts of that king, one above all hath the pre-eminence. It was the erection and institution of an Order or Society which we call *Salomon's House* ; the noblest foundation (as we think) that ever was upon the earth ; and the lanthorn of this kingdom. It is dedicated to the study of the Works and Creatures of God. Some think it beareth the founder's name a little corrupted, as if it should be Solamona's House. But the records write it as it is spoken. So as I take it to be denominate of the King of the Hebrews, which is famous with you, and no stranger to us. For we

have some parts of his works which with you are lost ; namely, that Natural History which he wrote, of all plants, from the *cedar of Libanus*' to the *moss that groweth out of the wall*, and of all things that have life and motion. This maketh me think that our king, finding himself to symbolize in many things with that king of the Hebrews (which lived many years before him), honoured him with the title of this foundation.<sup>1</sup> And I am the rather induced to be of this opinion, for that I find in ancient records this Order or Society is sometimes called Salomon's House, and sometimes the College of the Six Days Works ; whereby I am satisfied that our excellent king had learned from the Hebrews that God had created the world and all that therein is within six days ; and therefore he instituting that House for the finding out of the true nature of all things,<sup>2</sup> (whereby God might have the more glory in the workmanship of them, and men the more fruit in the use of them,) did give it also that second name. But now to come to our present purpose. When the king had forbidden to all his people navigation into any part that was not under his crown, he made nevertheless this ordinance ; That every twelve years there should be set forth out of this kingdom two ships, appointed to

<sup>1</sup> Bacon in speaking of this king who symbolizes with Solomon seems to allude to James I. — *R. L. E.* [If the *New Atlantis* had been written in the earlier part of James's reign, Bacon might have been suspected perhaps of some such allusion. He might have hoped to encourage James to justify the parallel by going and doing likewise. But since James had now reigned above twenty years without doing or attempting to do anything for the furtherance of Natural Philosophy ; without showing any interest in it or any taste or capacity for it ; I cannot understand what the allusion can be or where the resemblance. Nor does it seem necessary to suppose anything of the kind in order to explain why a model-king for wisdom and knowledge should be likened to Solomon. — *J. S.*]

<sup>2</sup> *ad inquisitionem et inventionem naturæ veræ et interioris rerum omnium*

several voyages ; That in either of these ships there should be a mission of three of the Fellows or Brethren of Salomon's House ; whose errand was only to give us knowledge of the affairs and state of those countries to which they were designed, and especially of the sciences, arts, manufactures, and inventions of all the world ; and withal to bring unto us books, instruments, and patterns in every kind ; That the ships, after they had landed the brethren, should return ; and that the brethren should stay abroad till the new mission. These ships are not otherwise fraught, than with store of victuals, and good quantity of treasure to remain with the brethren, for the buying of such things and rewarding of such persons as they should think fit. Now for me to tell you how the vulgar sort of mariners are contained from being discovered at land ; and how they that must be put on shore for any time, colour themselves under the names of other nations ; and to what places these voyages have been designed ; and what places of *rendez-vous* are appointed for the new missions ; and the like circumstances of the practise ; I may not do it : neither is it much to your desire. But thus you see we maintain a trade, not for gold, silver, or jewels ; nor for silks ; nor for spices ; nor any other commodity of matter ; but only for God's first creature, which was *Light* : to have *light* (I say) of the growth of all parts of the world." <sup>1</sup> And when he had said this, he was silent ; and so were we all. For indeed we were all astonished to hear so strange things so probably told. And he, perceiving that we were willing to say somewhat but

<sup>1</sup> i. e., in whatever parts of the world it is to be found. *Luce, inquam, quacunq; tandem terræ regione prorumpente et germinante.*

had it not ready, in great courtesy took us off, and descended to ask us questions of our voyage and fortunes; and in the end concluded, that we might do well to think with ourselves what time of stay we would demand of the state; and bade us not to scant ourselves; for he would procure such time as we desired. Whereupon we all rose up, and presented ourselves to kiss the skirt of his tippet; but he would not suffer us; and so took his leave. But when it came once amongst our people that the state used to offer conditions to strangers that would stay, we had work enough to get any of our men to look to our ship, and to keep them from going presently to the governor to crave conditions. But with much ado we refrained them, till we might agree what course to take.

We took ourselves now for free men, seeing there was no danger of our utter perdition; and lived most joyfully, going abroad and seeing what was to be seen in the city and places adjacent within our tedder; and obtaining acquaintance with many of the city, not of the meanest quality; at whose hands we found such humanity, and such a freedom and desire to take strangers as it were into their bosom, as was enough to make us forget all that was dear to us in our own countries: and continually we met with many things right worthy of observation and relation; as indeed, if there be a mirror in the world worthy to hold men's eyes, it is that country. One day there were two of our company bidden to a Feast of the Family, as they call it. A most natural, pious, and reverend custom it is, shewing that nation to be compounded of all woodness. This is the manner of it. It is granted to

any man that shall live to see thirty persons descended of his body alive together, and all above three years old, to make this feast; which is done at the cost of the state. The Father of the Family, whom they call the *Tirsan*, two days before the feast, taketh to him three of such friends as he liketh to choose; and is assisted also by the governor of the city or place where the feast is celebrated; and all the persons of the family, of both sexes, are summoned to attend him. These two days the *Tirsan* sitteth in consultation concerning the good estate of the family. There, if there be any discord or suits between any of the family, they are compounded and appeased. There, if any of the family be distressed or decayed, order is taken for their relief and competent means to live. There, if any be subject to vice, or take ill courses, they are reprov'd and censured. So likewise direction is given touching marriages, and the courses of life which any of them should take, with divers other the like orders and advices. The governor assisteth, to the end to put in execution by his public authority the decrees and orders of the *Tirsan*, if they should be disobey'd; though that seldom needeth; such reverence and obedience they give to the order of nature. The *Tirsan* doth also then ever choose one man from amongst his sons, to live in house with him: who is called ever after the Son of the Vine. The reason will hereafter appear. On the feast-day, the Father or *Tirsan* cometh forth after divine service into a large room where the feast is celebrated; which room hath an half-pace<sup>1</sup> at the upper end. Against the wall, in the

<sup>1</sup> Half-pace or dais, the part raised by a low step above the rest of the floor. — R. L. E.

middle of the half-pace, is a chair placed for him, with a table and carpet before it. Over the chair is a state,<sup>1</sup> made round or oval, and it is of ivy; an ivy somewhat whiter than ours, like the leaf of a silver asp, but more shining; for it is green all winter. And the state is curiously wrought with silver and silk of divers colours, broiding or binding in the ivy; and is ever of the work of some of the daughters of the family; and veiled over at the top with a fine net of silk and silver. But the substance of it is true ivy; whereof, after it is taken down, the friends of the family are desirous to have some leaf or sprig to keep. The Tirsan cometh forth with all his generation or lineage,<sup>2</sup> the males before him, and the females following him; and if there be a mother from whose body the whole lineage is descended, there is a traverse placed in a loft above on the right hand of the chair, with a privy door, and a carved window of glass, leaded with gold and blue; where she sitteth, but is not seen. When the Tirsan is come forth, he sitteth down in the chair; and all the lineage place themselves against the wall, both at his back and upon the return of the half-pace,<sup>3</sup> in order of their years without difference of sex; and stand upon their feet. When he is set; the room being always full of company, but well kept and without disorder; after some pause there cometh in from the lower end of the room a *Taratan* (which is as much as an herald) and on either side of

<sup>1</sup> i. e. a canopy, *conopeum*.

<sup>2</sup> *linage* in the original; which seems to be the proper form of the word. The *e* may have been introduced originally as a direction for the lengthening of the first syllable; and then the resemblance of the word to such words as *lineal* may have suggested the modern pronunciation.

<sup>3</sup> *juxta parietem, tam a tergo quam a lateribus aulae, super gradum ascendis.*

him two young lads; whereof one carrieth a scroll of their shining yellow parchment; and the other a cluster of grapes of gold, with a long foot or stalk. The herald and children are clothed with mantles of seawater green sattin; but the herald's mantle is streamed with gold, and hath a train. Then the herald with three curtesies, or rather inclinations, cometh up as far as the half-pace; and there first taketh into his hand the scroll. This scroll is the King's Charter, containing gift of revenew, and many privileges, exemptions, and points of honour, granted to the Father of the Family; and is ever styled and directed, *To such an one our well-beloved friend and creditor*: which is a title proper only to this case. For they say the king is debtor to no man, but for propagation of his subjects. The seal set to the king's charter is the king's image, imbossed or moulded in gold; and though such charters be expedited of course, and as of right, yet they are varied by discretion, according to the number and dignity of the family. This charter the herald readeth aloud; and while it is read, the father or Tirsan standeth up, supported by two of his sons, such as he chooseth. Then the herald mounteth the half-pace, and delivereth the charter into his hand: and with that there is an acclamation by all that are present in their language, which is thus much: *Happy are the people of Bensalem*. Then the herald taketh into his hand from the other child the cluster of grapes, which is of gold, both the stalk and the grapes. But the grapes are daintily enamelled; and if the males of the family be the greater number, the grapes are enamelled purple, with a little sun set on the top; if the females, then they are enamelled into a greenish yellow, with a

crescent on the top. The grapes are in number as many as there are descendants of the family. This golden cluster the herald delivereth also to the Tirsan; who presently delivereth it over to that son that he had formerly chosen to be in house with him: who beareth it before his father as an ensign of honour when he goeth in public, ever after; and is thereupon called the Son of the Vine. After this ceremony ended, the father or Tirsan retireth; and after some time cometh forth again to dinner, where he sitteth alone under the state, as before; and none of his descendants sit with him, of what degree or dignity soever, except he hap to be of Salomon's House. He is served only by his own children, such as are male; who perform unto him all service of the table upon the knee; and the women only stand about him, leaning against the wall. The room below the half-pace hath tables on the sides for the guests that are bidden; who are served with great and comely order; and towards the end of dinner (which in the greatest feasts with them lasteth never above an hour and an half) there is an hymn sung, varied according to the invention of him that composeth it, (for they have excellent poesy,) but the subject of it is (always) the praises of Adam and Noah and Abraham; whereof the former two peopled the world, and the last was the Father of the Faithful: concluding ever with a thanksgiving for the nativity of our Saviour, in whose birth the births of all are only blessed. Dinner being done, the Tirsan retireth again; and having withdrawn himself alone into a place where he maketh some private prayers, he cometh forth the third time, to give the blessing; with all his descendants, who stand about him as at the first. Then he

calleth them forth by one and by one, by name, as he pleaseth, though seldom the order of age be inverted. The person that is called (the table being before removed) kneeleth down before the chair, and the father layeth his hand upon his head, or her head, and giveth the blessing in these words: *Son of Bensalem, (or Daughter of Bensalem,) thy father saith it: the man by whom thou hast breath and life speaketh the word: The blessing of the everlasting Father, the Prince of Peace, and the Holy Dove be upon thee, and make the days of thy pilgrimage good and many.* This he saith to every of them; and that done, if there be any of his sons of eminent merit and virtue, (so they be not above two,) he calleth for them again; and saith, laying his arm over their shoulders, they standing; *Sons, it is well ye are born, give God the praise, and persevere to the end.* And withal delivereth to either of them a jewel, made in the figure of an ear of wheat, which they ever after wear in the front of their turban or hat. This done, they fall to music and dances, and other recreations, after their manner, for the rest of the day. This is the full order of that feast.

By that time six or seven days were spent, I was fallen into strait acquaintance with a merchant of that city; whose name was Joabin. He was a Jew, and circumcised: for they have some few stirps of Jews yet remaining among them, whom they leave to their own religion. Which they may the better do, because they are of a far differing disposition from the Jews in other parts. For whereas they hate the name of Christ, and have a secret inbred rancour against the people amongst whom they live: these (contrariwise) give unto our Saviour many high attributes, and love the nation

of Bensalem extremely. Surely this man of whom I speak would ever acknowledge that Christ was born of a Virgin, and that he was more than a man; and he would tell how God made him ruler of the Seraphims which guard his throne; and they call him also the *Milken Way*, and the *Elijah* of the *Messiah*; and many other high names; which though they be inferior to his divine Majesty, yet they are far from the language of other Jews. And for the country of Bensalem, this man would make no end of commending it: being desirous, by tradition among the Jews there, to have it believed that the people thereof were of the generations of Abraham, by another son, whom they call Nachoran; and that Moses by a secret cabala ordained the laws of Bensalem which they now use; and that when the Messiah should come, and sit in his throne at Hierusalem, the king of Bensalem should sit at his feet, whereas other kings should keep a great distance. But yet setting aside these Jewish dreams, the man was a wise man, and learned, and of great policy, and excellently seen in the laws and customs of that nation. Amongst other discourses, one day I told him I was much affected with the relation I had from some of the company, of their custom in holding the Feast of the Family; for that (methought) I had never heard of a solemnity wherein nature did so much preside. And because propagation of families proceedeth from the nuptial copulation, I desired to know of him what laws and customs they had concerning marriage; and whether they kept marriage well; and whether they were tied to one wife? For that where population is so much affected, and such as with them it seemed to be, there is commonly permission of plu-

rality of wives. To this he said, " You have reason for to commend that excellent institution of the Feast of the Family. And indeed we have experience, that those families that are partakers of the blessing of that feast do flourish and prosper ever after in an extraordinary manner. But hear me now, and I will tell you what I know. You shall understand that there is not under the heavens so chaste a nation as this of Bensalem ; nor so free from all pollution or foulness. It is the virgin of the world. I remember I have read in one of your European books, of an holy hermit amongst you that desired to see the Spirit of Fornication ; and there appeared to him a little foul ugly Æthiop.<sup>1</sup> But if he had desired to see the Spirit of Chastity of Bensalem, it would have appeared to him in the likeness of a fair beautiful Cherubin. For there is nothing amongst mortal men more fair and admirable, than the chaste minds of this people. Know therefore, that with them there are no stews, no dissolute houses, no courtesans, nor anything of that kind. Nay they wonder (with detestation) at you in Europe, which permit such things. They say ye have put marriage out of office : for marriage is ordained a remedy for unlawful concupiscence ; and natural concupiscence seemeth as a spur to marriage. But when men have at hand a remedy more agreeable to their corrupt will, marriage is almost expelled. And therefore there are with you seen infinite men that marry not, but chuse rather a libertine and impure single life, than to be yoked in marriage ; and many that do marry, marry late, when the prime and strength of their years is past. And when they do marry, what is marriage to them but a

<sup>1</sup> The Klein Meister of La Motte Fouqué's *Sintram*. — R. L. E.

very bargain ; wherein is sought alliance, or portion, or reputation, with some desire (almost indifferent) of issue ; and not the faithful nuptial union of man and wife, that was first instituted. Neither is it possible that those that have cast away so basely so much of their strength, should greatly esteem children, (being of the same matter,<sup>1</sup>) as chaste men do. So likewise during marriage, is the case much amended, as it ought to be if those things were tolerated only for necessity? No, but they remain still as a very affront to marriage. The haunting of those dissolute places, or resort to courtesans, are no more punished in married men than in bachelors. And the depraved custom of change, and the delight in meretricious embracements, (where sin is turned into art,)<sup>2</sup> maketh marriage a dull thing, and a kind of imposition or tax. They hear you defend these things, as done to avoid greater evils ; as advoutries, deflouring of virgins, unnatural lust, and the like. But they say this is a preposterous wisdom ; and they call it *Lot's offer*, who to save his guests from abusing, offered his daughters : nay they say farther that there is little gained in this ; for that the same vices and appetites do still remain and abound ; unlawful lust being like a furnace, that if you stop the flames altogether, it will quench ; but if you give it any vent, it will rage. As for masculine love, they have no touch of it ;<sup>3</sup> and yet there are not so faithful and inviolate friendships in the world again as are there ; and to speak generally, (as I said before,) I have not

<sup>1</sup> *liberi (pars nostri altera).*

<sup>2</sup> Non v' era giunto ancor Sardanapalo  
A mostra- cio ch' in camera si puote.

DANTE, *Paradiso*, xiv.—R. L. E.

<sup>3</sup> *istos ne fando quidem norunt.*

read of any such chastity in any people as theirs. And their usual saying is, *That whosoever is unchaste cannot reverence himself*; and they say, *That the reverence of a man's self is, next religion, the chiefest bridle of all vices.*" And when he had said this, the good Jew paused a little; whereupon I, far more willing to hear him speak on than to speak myself, yet thinking it decent that upon his pause of speech I should not be altogether silent, said only this; "That I would say to him, as the widow of Sarepta said to Elias; that he was come to bring to memory our sins; and that I confess the righteousness of Bensalem was greater than the righteousness of Europe." At which speech he bowed his head, and went on in this manner: "They have also many wise and excellent laws touching marriage. They allow no polygamy. They have ordained that none do intermarry or contract, until a month be passed from their first interview. Marriage without consent of parents they do not make void, but they mulct it in the inheritors: for the children of such marriages are not admitted to inherit above a third part of their parents' inheritance. I have read in a book of one of your men, of a Feigned Commonwealth, where the married couple are permitted, before they contract, to see one another naked.<sup>1</sup> This they dislike; for they think it a scorn to give a refusal after so familiar knowledge: but because of many hidden defects in men and women's bodies,<sup>2</sup> they have a more civil way; for they have near every town a couple of pools, (which they call *Adam and Eve's pools*,) where it is permitted to one of the friends of the man, and

<sup>1</sup> See More's *Utopia*, book ii. — *R. L. E.*

<sup>2</sup> The translation adds *qui matrimonium postea infelix reddere possint.*

another of the friends of the woman, to see them severally bathe naked."

And as we were thus in conference, there came one that seemed to be a messenger, in a rich huke,<sup>1</sup> that spake with the Jew: whereupon he turned to me and said; "You will pardon me, for I am commanded away in haste." The next morning he came to me again, joyful as it seemed, and said, "There is word come to the governor of the city, that one of the Fathers of Salomon's House will be here this day seven-night: we have seen none of them this dozen years. His coming is in state; but the cause of his coming is secret. I will provide you and your fellows of a good standing to see his entry." I thanked him, and told him, "I was most glad of the news." The day being come, he made his entry. He was a man of middle stature and age, comely of person, and had an aspect as if he pitied men. He was clothed in a robe of fine black cloth, with wide sleeves and a cape. His under garment was of excellent white linen down to the foot, girt with a girdle of the same; and a sindon or tippet of the same about his neck. He had gloves that were curious, and set with stone; and shoes of peach-coloured velvet. His neck was bare to the shoulders. His hat was like a helmet, or Spanish Montera; and his locks curled below it decently: they were of colour brown. His beard was cut round, and of the same colour with his hair, somewhat lighter.<sup>2</sup> He was carried in a rich chariot without wheels, litter-wise; with two horses at either end, richly trapped

<sup>1</sup> *indutus tunicâ pictâ et inauratâ.*

<sup>2</sup> The words "somewhat lighter" are omitted in the translation.

in blue velvet embroidered; and two footmen on each side in the like attire. The chariot was all of cedar gilt, and adorned with crystal; save that the fore-end had pannels of sapphires, set in borders of gold, and the hinder-end the like of emeralds<sup>1</sup> of the Peru colour. There was also a sun of gold, radiant, upon the top, in the midst;<sup>2</sup> and on the top before, a small cherub of gold, with wings displayed. The chariot was covered with cloth of gold tissue upon blue. He had before him fifty attendants, young men all, in white sattin loose coats to the mid-leg; and stockings of white silk; and shoes of blue velvet; and hats of blue velvet; with fine plumes of divers colours, set round like hat-bands. Next before the chariot went two men, bare-headed, in linen garments down the foot, girt, and shoes of blue velvet; who carried the one a crosier, the other a pastoral staff like a sheep-hook; neither of them of metal, but the crosier of balm-wood, the pastoral staff of cedar. Horsemen he had none, neither before nor behind his chariot: as it seemeth, to avoid all tumult and trouble. Behind his chariot went all the officers and principals of the Companies of the City. He sat alone, upon cushions of a kind of excellent plush, blue; and under his foot curious carpets of silk of divers colours, like the Persian, but far finer. He held up his bare hand as he went, as blessing the people, but in silence. The street was wonderfully well kept:<sup>3</sup> so that there was never any army had their men stand in better battle-array, than the people stood. The windows likewise were not crowded, but

<sup>1</sup> *emerauds* in orig.

<sup>2</sup> *Etiam in medio verticis cathedræ, sol erat, ex auro radians.*

<sup>3</sup> *Plateæ ita erant ordinatæ ut via ampla pateret, nullibi interclusa.*

every one stood in them as if they had been placed. When the shew was past, the Jew said to me; "I shall not be able to attend you<sup>1</sup> as I would, in regard of some charge the city hath laid upon me, for the entertaining of this great person." Three days after, the Jew came to me again, and said; "Ye are happy men; for the Father of Salomon's House taketh knowledge of your being here, and commanded me to tell you that he will admit all your company to his presence, and have private conference with one of you that ye shall choose: and for this hath appointed the next day after to-morrow. And because he meaneth to give you his blessing, he hath appointed it in the forenoon." We came at our day and hour, and I was chosen by my fellows for the private access. We found him in a fair chamber, richly hanged, and carpeted under foot, without any degrees to the state. He was set upon a low throne richly adorned, and a rich cloth of state over his head, of blue sattin embroidered. He was alone, save that he had two pages of honour, on either hand one, finely attired in white. His under-garments were the like that we saw him wear in the chariot; but instead of his gown, he had on him a mantle with a cape, of the same fine black, fastened about him. When we came in, as we were taught, we bowed low at our first entrance; and when we were come near his chair, he stood up, holding forth his hand ungloved, and in posture of blessing; and we every one of us stooped down, and kissed the hem of his tippet. That done, the rest departed, and I remained. Then he warned the pages forth of the room, and caused me to sit down beside him, and spake to me thus in the Spanish tongue:

<sup>1</sup> *Per aliquot jam dies detinebor, quò minus, &c.*

“God bless thee, my son; I will give thee the greatest jewel I have. For I will impart unto thee, for the love of God and men, a relation of the true state of Salomon’s House. Son, to make you know the true state of Salomon’s House, I will keep this order. First, I will set forth unto you the end of our foundation. Secondly, the preparations and instruments we have for our works. Thirdly, the several employments and functions whereto our fellows are assigned. And fourthly, the ordinances and rites which we observe.

“The End of our Foundation is the knowledge of Causes, and secret motions of things;<sup>1</sup> and the enlarging of the bounds of Human Empire, to the effecting of all things possible.

“The Preparations and Instruments are these. We have large and deep caves of several depths: the deepest are sunk six hundred fathom; and some of them are digged and made under great hills and mountains: so that if you reckon together the depth of the hill and the depth of the cave, they are (some of them) above three miles deep. For we find that the depth of a hill, and the depth of a cave from the flat, is the same thing; both remote alike from the sun and heaven’s beams, and from the open air. These caves we call the Lower Region. And we use them for all coagulations, indurations, refrigerations, and conservations of bodies. We use them likewise for the imitation of natural mines; and the producing also of new artificial metals, by compositions and materials which we use,

<sup>1</sup> *et motuum, ac virtutum interiorum in Natura.*

<sup>2</sup> *quæ ibi præparamus.*

and lay there for many years. We use them also sometimes, (which may seem strange,) for curing of some diseases, and for prolongation of life in some hermits that choose to live there, well accommodated of all things necessary; and indeed live very long; by whom also we learn many things.

“We have burials in several earths,<sup>1</sup> where we put divers cements, as the Chinese do their porcellain. But we have them in greater variety, and some of them more fine. We have also great variety of composts, and soils,<sup>2</sup> for the making of the earth fruitful.

“We have high towers; the highest about half a mile in height; and some of them likewise set upon high mountains; so that the vantage of the hill with the tower is in the highest of them three miles at least. And these places we call the Upper Region: accounting the air between the high places and the low, as a Middle Region. We use these towers, according to their several heights and situations, for insolation, refrigeration, conservation; and for the view of divers meteors; as winds, rain, snow, hail; and some of the fiery meteors also. And upon them, in some places, are dwellings of hermits, whom we visit sometimes, and instruct what to observe.

“We have great lakes both salt and fresh, whereof we have use for the fish and fowl.<sup>3</sup> We use them also for burials of some natural bodies: for we find a difference in things buried in earth or in air below the earth, and things buried in water. We have also

<sup>1</sup> *Habemus etiam alias sepulturas corporum naturalium et materialium; non in concavo aliquo, sed in ipsa terra contigua, ubi complura cœmenta condimus, &c.*

<sup>2</sup> *stercorationum et fîmorum varietatem magnam, item congestionum et massarum aliarum, &c.*

<sup>3</sup> *aves item palustres et aquaticas, omnis generis.*

pools, of which some do strain fresh water out of salt ; and others by art do turn fresh water into salt. We have also some rocks in the midst of the sea, and some bays<sup>1</sup> upon the shore, for some works wherein is required the air and vapour of the sea. We have likewise violent streams and cataracts, which serve us for many motions :<sup>2</sup> and likewise engines for multiplying and enforcing of winds, to set also on going divers motions.<sup>3</sup>

“ We have also a number of artificial wells and fountains, made in imitation of the natural sources and baths ; as tinted upon vitriol, sulphur, steel, brass, lead, nitre, and other minerals. And again we have little wells for infusions of many things, where the waters take the virtue<sup>4</sup> quicker and better than in vessels or basons. And amongst them we have a water which we call Water of Paradise, being, by that we do to it, made very sovereign for health, and prolongation of life.

“ We have also great and spacious houses, where we imitate and demonstrate<sup>5</sup> meteors ; as snow, hail, rain, some artificial rains of bodies and not of water, thunders, lightnings ;<sup>6</sup> also generations of bodies in air ; as frogs, flies, and divers others.

“ We have also certain chambers, which we call Chambers of Health, where we qualify the air as we think good and proper for the cure of divers diseases, and preservation of health.<sup>7</sup>

<sup>1</sup> *loca quædam aprica.*

<sup>2</sup> *motuum violentorum.*

<sup>3</sup> *quæ ventos excipiant, multiplicent, et roborent.*

<sup>4</sup> *ubi aqua (currrens scilicet) virtutem corporum melius et vivacius, &c.*

<sup>5</sup> *i. e. exhibit: in quibus imitamenta et representationes meteororum exhibentur.*

<sup>6</sup> The translation adds *coruscationum.*

<sup>7</sup> This experiment has been tried, especially by Dr. Beddoes of Clifton

“ We have also fair and large baths, of several mixtures, for the cure of diseases, and the restoring of man’s body from arefaction: and others for the confirming of it in strength of sinews, vital parts, and the very juice and substance of the body.

“ We have also large and various orchards and gardens, wherein we do not so much respect beauty, as variety of ground and soil, proper for divers trees and herbs: and some very spacious, where trees and berries are set whereof we make divers kinds of drinks, besides the vineyards. In these we practise likewise all conclusions of grafting and inoculating, as well of wild-trees as fruit-trees, which produceth many effects. And we make (by art) in the same orchards and gardens, trees and flowers to come earlier or later than their seasons; and to come up and bear more speedily than by their natural course they do. We make them also by art greater much than their nature; and their fruit greater and sweeter and of differing taste, smell, colour, and figure, from their nature. And many of them we so order, as they become of medicinal use.

“ We have also means to make divers plants rise by mixtures of earths without seeds; and likewise to make divers new plants, differing from the vulgar; and to make one tree or plant turn into another.

“ We have also parks and inclosures of all sorts of beasts and birds, which we use not only for view or rareness, but likewise for dissections and trials; that thereby we may take light what may be wrought upon the body of man. Wherein we find many strange ef-

but without any marked result. Some relief has been obtained in cases of phthisis by inhaling oxygenated air. — *R. L. E.*

fects ; as continuing life in them, though divers parts, which you account vital, be perished and taken forth ; resuscitating of some that seem dead in appearance ; and the like. We try also all poisons and other medicines upon them, as well of chirurgery as physic.<sup>1</sup> By art likewise, we make them greater or taller than their kind is ; and contrariwise dwarf them, and stay their growth : we make them more fruitful and bearing than their kind is ; and contrariwise barren and not generative. Also we make them differ in colour, shape, activity, many ways. We find means to make commixtures and copulations of different kinds ; which have produced many new kinds, and them not barren, as the general opinion is. We make a number of kinds of serpents, worms, flies, fishes, of putrefaction ; whereof some are advanced (in effect) to be perfect creatures, like beasts or birds ; and have sexes, and do propagate. Neither do we this by chance, but we know beforehand of what matter and commixture what kind of those creatures will arise.<sup>2</sup>

“ We have also particular pools, where we make trials upon fishes, as we have said before of beasts and birds.

“ We have also places for breed and generation of those kinds of worms and flies which are of special use ; such as are with you your silk-worms and bees.

<sup>1</sup> The translation adds *ut corpori humano melius caveamus.*

<sup>2</sup> This passage is quoted with great approbation by Geoffroi St. Hilaire at the end of a memoir on the results of artificial incubation read before the Academy of Sciences in 1826, and published in the *Annales du Museum* for that year. It may be said that he was the first by whom the scientific importance of monstrosities was fully appreciated, and in answer to the objections which were made to the study of Teratology on the ground of its inutility, he invokes the authority of Bacon. — *R. L. E.*

“I will not hold you long with recounting of our brew-houses, bake-houses, and kitchens, where are made divers drinks, breads, and meats, rare and of special effects. Wines we have of grapes; and drinks of other juice of fruits, of grains, and of roots:<sup>1</sup> and of mixtures with honey, sugar, manna, and fruits dried and decocted. Also of the tears or woundings of trees, and of the pulp of canes. And these drinks are of several ages, some to the age or last of forty years. We have drinks also brewed with several herbs, and roots, and spices; yea with several fleshes, and white meats;<sup>2</sup> whereof some of the drinks are such, as they are in effect meat and drink both:<sup>3</sup> so that divers, especially in age, do desire to live with them, with little or no meat or bread. And above all, we strive to have drinks of extreme thin parts, to insinuate into the body, and yet without all biting, sharpness, or fretting; insomuch as some of them put upon the back of your hand will, with a little stay, pass through to the palm, and yet taste mild to the mouth. We have also waters which we ripen in that fashion, as they become nourishing; so that they are indeed excellent drink; and many will use no other. Breads we have of several grains, roots, and kernels: yea and some of flesh and fish dried; with divers kinds of leavenings and seasonings: so that some do extremely move appetites; some do nourish so, as divers do live of them, without any other meat; who live very long. So for meats, we

<sup>1</sup> *decoctionibus granorum et radicum.*

<sup>2</sup> *quin e. additis quandoque carnibus, ovis, lacticiniis, et aliis esculentis.*

<sup>3</sup> Chocolate, which however was well known in Bacon's time, seems to fulfil this description. It long since gave rise to a doubt whether drinking it amounted to breaking fast. See the treatise of the Jesuit Hurtado, *Utrum potio chocolatica frangat jejuniū Ecclesiæ.*—*R. L. F.*

have some of them so beaten and made tender and mortified, yet without all corrupting, as a weak heat of the stomach will turn them into good chylus, as well as a strong heat would meat otherwise prepared. We have some meats also and breads and drinks, which taken by men enable them to fast long after; and some other, that used make the very flesh of men's bodies sensibly more hard and tough, and their strength far greater than otherwise it would be.

“ We have dispensatories, or shops of medicines. Wherein you may easily think, if we have such variety of plants and living creatures more than you have in Europe, (for we know what you have,) the simples, drugs, and ingredients of medicines, must likewise be in so much the greater variety. We have them likewise of divers ages, and long fermentations. And for their preparations,<sup>1</sup> we have not only all manner of exquisite distillations and separations, and especially by gentle heats and percolations through divers strainers, yea and substances;<sup>2</sup> but also exact forms of composition, whereby they incorporate almost, as they were natural simples.

“ We have also divers mechanical arts, which you have not; and stuffs made by them; as papers, linen, silks, tissues; dainty works of feathers of wonderful lustre; excellent dyes, and many others; and shops likewise,<sup>3</sup> as well for such as are not brought into vulgar use amongst us as for those that are. For you must know that of the things before recited, many of

<sup>1</sup> *medicinarum preparationes.*

<sup>2</sup> *per diversa lintea, lanea, ligna, imò et substantias solidiores.*

<sup>3</sup> *officinas etiam aliquarum artium prædictarum.*

them are grown into use throughout the kingdom ; but yet if they did flow from our invention, we have of them also for patterns and principals.<sup>1</sup>

“ We have also furnaces of great diversities, and that keep great diversity of heats ; fierce and quick ; strong and constant ; soft and mild ; blown, quiet ; dry, moist ; and the like. But above all, we have heats in imitation of the sun’s and heavenly bodies’ heats, that pass divers inequalities and (as it were) orbs, progresses, and returns, whereby we produce admirable effects. Besides, we have heats<sup>2</sup> of dungs, and of bellies and maws of living creatures, and of their bloods and bodies ; and of hays and herbs laid up moist ; of lime unquenched ; and such like. Instruments also which generate heat only by motion.<sup>3</sup> And farther, places for strong insolutions ; and again, places under the earth, which by nature or art yield heat. These divers heats we use, as the nature of the operation which we intend requireth.

“ We have also perspective-houses, where we make demonstrations of all lights and radiations ; and of all colours ; and out of things uncoloured and transparent, we can represent unto you all several colours ; not in rain-bows,<sup>4</sup> as it is in gems and prisms, but of themselves single.<sup>5</sup> We represent also all multiplications of light, which we carry to great distance, and make so sharp as to discern small points and lines ; also all colorations of light : all delusions and deceits of the

<sup>1</sup> eorum quandoque exemplaria, tanquam primigenia, et optimè elaborata, in Domo nostrâ retinemus.

<sup>2</sup> imitationes caloris.

<sup>3</sup> Bacon seems to refer to the result of his investigation into the form of heat, namely that heat is a kind of motion. — R. L. E.

<sup>4</sup> non in formâ iridum gliscentes.

<sup>5</sup> sed per se simplices et constantes.

sight, in figures, magnitudes, motions, colours: all demonstrations of shadows.<sup>1</sup> We find also divers means, yet unknown to you, of producing of light originally from divers bodies. We procure means of seeing objects afar off; as in the heaven and remote places; and represent things near as afar off, and things afar off as near; making feigned distances. We have also helps for the sight, far above spectacles and glasses in use.<sup>2</sup> We have also glasses and means<sup>3</sup> to see small and minute bodies perfectly and distinctly; as the shapes and colours of small flies and worms, grains and flaws in gems, which cannot otherwise be seen; observations in urine<sup>4</sup> and blood, not otherwise to be seen.<sup>5</sup> We make artificial rain-bows, halos, and circles about light.<sup>6</sup> We represent also all manner of reflexions, refractions, and multiplications of visual beams of objects.

“ We have also precious stones of all kinds, many of them of great beauty, and to you unknown; crystals likewise; and glasses of divers kinds; and amongst them some of metals vitrified, and other materials besides those of which you make glass. Also a num-

<sup>1</sup> *umbrarum et imaginum in aëre volitantium.*

<sup>2</sup> *quæ bisoculis vestris et speculis, usu longe præstant.*

<sup>3</sup> *artificia.*

<sup>4</sup> It has been proposed to facilitate the examination of diabetic urine by an apparatus in which the amount of sugar present in it is to be measured by its effect on the plane of polarisation of polarised light transmitted through it.—*R. L. E.*

<sup>5</sup> Nothing that has been accomplished with the microscope would have interested Bacon more than the discoveries of Schleiden and Schwann, because nothing has brought us so near the *latens processus* by which the tissues of organic life are formed. It is remarkable that when Schleiden and as he conceived destroyed the analogy between the developments of vegetable and animal life, by showing that all vegetable tissues are developed by cells, Schwann should have re-established it more clearly than before by showing that this is true of all animal tissues also.—*R. L. E.*

<sup>6</sup> *halones, circulos, vibrationes et trepidationes luminis.*

ber of fossils, and imperfect minerals, which you have not. Likewise loadstones of prodigious virtue; and other rare stones, both natural and artificial.

“ We have also sound-houses, where we practise and demonstrate all sounds, and their generation. We have harmonies which you have not, of quarter-sounds, and lesser slides of sounds.<sup>1</sup> Divers instruments of music likewise to you unknown, some sweeter than any you have; together with bells and rings that are dainty and sweet. We represent small sounds as great and deep; likewise great sounds extenuate and sharp; we make divers tremblings and warblings of sounds, which in their original are entire. We represent and imitate all articulate sounds and letters, and the voices and notes of beasts and birds. We have certain helps which set to the ear do further the hearing greatly. We have also divers strange and artificial echos, reflecting the voice many times, and as it were tossing it: and some that give back the voice louder than it came; some shriller, and some deeper; yea, some rendering the voice differing in the letters or articulate sound from that they receive. We have also means to convey sounds in trunks and pipes, in strange lines and distances.<sup>2</sup>

“ We have also perfume-houses; wherewith we join also practices of taste. We multiply smells, which may seem strange. We imitate smells, making all smells to breathe out of other mixtures than those that give them.<sup>3</sup> We make divers imitations of taste

<sup>1</sup> *miscentes non tantum Beta illud acutum et molle, ut vos, sed quadrantes sonorum; et sonos tremulos aliquos dulcissimos.*

<sup>2</sup> [*ad magnam distantiam, et in lineis tortuosis.*] This is now done very effectually by means of gutta percha tubing.—*R. L. E.*

<sup>3</sup> This power of imitating smells is one of the recent achievements of

likewise, so that they will deceive any man's taste. And in this house we contain also a confiture-house; where we make all sweet-meats, dry and moist,<sup>1</sup> and divers pleasant wines, milks, broths, and sallets, in far greater variety than you have. .

“ We have also engine-houses, where are prepared engines and instruments for all sorts of motions. There we imitate and practise to make swifter motions than any you have, either out of your muskets or any engine that you have; and to make them and multiply them more easily, and with small force,<sup>2</sup> by wheels and other means: and to make them stronger, and more violent than yours are; exceeding your greatest cannons and basilisks. We represent also ordnance and instruments of war, and engines of all kinds: and likewise new inixtures and compositions of gun-powder, wildfires burning in water, and unquenchable. Also fire-works of all variety both for pleasure and use. We imitate also flights of birds, we have some degrees of flying in the air;<sup>3</sup> we have ships and boats for going under water,<sup>4</sup> and brooking

chemistry. From fusil oil, a product of the distillation of spirits from potatoes, itself exceedingly offensive, may be got oil of apples, oil of pears, oil of grapes, and oil of cognac. The oil of pine-apples and that of bitter almonds enable confectioners to imitate perfectly the scent and flavour of pine-apples and bitter almonds respectively, and both, like the perfumes already mentioned, are got from very offensive substances. — *R. L. E.*

<sup>1</sup> The translation adds *imò et condimus ea cum rebus aliis dulcibus, gratissimis, præter saccharum et mel.*

<sup>2</sup> *motus reddere faciliores et intentiores, eos multiplicando per rotas et alios modos.*

<sup>3</sup> *gradus quosdam habemus et commoditates vecturæ per aërem instar animalium alatorum.*

<sup>4</sup> A boat for going under water was one of Drebbel's inventions exhibited in 1620. Bacon in the *De Augmentis* refers to another namely Drebbel's method of producing cold. — *R. L. E.*

of seas; also swimming-girdles and supporters. We have divers curious clocks, and other like motions of return,<sup>1</sup> and some perpetual motions. We imitate also motions of living creatures, by images of men, beasts, birds, fishes, and serpents. We have also a great number of other various<sup>2</sup> motions, strange for equality, fineness, and subtilty.

“ We have also a mathematical house, where are represented all instruments, as well of geometry as astronomy, exquisitely made.

“ We have also houses of deceits of the senses; where we represent all manner of feats of juggling, false apparitions, impostures, and illusions; and their fallacies. And surely you will easily believe that we that have so many things truly natural which induce admiration, could in a world of particulars deceive the senses, if we would disguise those things and labour to make them seem more miraculous. But we do hate all impostures and lies: insomuch as we have severely forbidden it to all our fellows, under pain of ignominy and fines, that they do not shew any natural work or thing, adorned or swelling;<sup>3</sup> but only pure as it is, and without all affectation of strangeness.

“ These are (my son) the riches of Salomon’s House.

“ For the several employments and offices of our fellows; we have twelve that sail into foreign countries, under the names of other nations, (for our own we conceal;) who bring us the books, and abstracts,

<sup>1</sup> *et alios motus aëris et aquarum, in orbem et per vices revertentes.*

<sup>2</sup> The word “various,” which seems to be redundant, is omitted in the translation.

<sup>3</sup> *artificioso apparatu ementitum.*

and patterns of experiments of all other parts.<sup>1</sup> These we call Merchants of Light.

“ We have three that collect the experiments which are in all books. These we call Depredators.

“ We have three that collect the experiments of all mechanical arts ; and also of liberal sciences ; and also of practices which are not brought into arts. These we call Mystery-men.<sup>2</sup>

“ We have three that try new experiments, such as themselves think good. These we call Pioners or Miners.

“ We have three that draw the experiments of the former four into titles and tables, to give the better light for the drawing of observations and axioms out of them. These we call Compilers.<sup>3</sup>

“ We have three that bend themselves, looking into the experiments of their fellows, and cast about how to draw out of them things of use and practice for man’s life, and knowledge<sup>4</sup> as well for works as for plain demonstration of causes, means of natural divinations, and the easy and clear discovery of the virtues and parts of bodies.<sup>5</sup> These we call Dowry-men or Benefactors.<sup>6</sup>

“ Then after divers meetings and consults of our

<sup>1</sup> *qui libros, et materias et exemplaria experimentorum ad nos perferunt.*

<sup>2</sup> In the translation they are called *Venatores*, hunters; a name, however, which does not seem to distinguish their peculiar office so accurately as “mystery-men,” that is, men whose business was to inquire after mysteries, *i. e.* crafts.

<sup>3</sup> These represent the formation of the tables *comparentiæ*, *absentiæ* in *proximo*, and *graduum*. See *Novum Organum*, ii. § 11—13. — *R. L. E.* For “compilers,” the translation has *divisores*, distributors.

<sup>4</sup> *necnon quæ inserviant scientiis, non solum quoad opera, sed, &c.*

<sup>5</sup> *quæ sint in corporibus singulis partes latentes, quæ virtutes.*

<sup>6</sup> These represent the *Vindemiatio prima*. See *Nov. Org.* ii. § 20. — *R. L. E.*

whole number, to consider of the former labours and collections,<sup>1</sup> we have three that take care, out of them, to direct new experiments, of a higher light, more penetrating into nature than the former. These we call Lamps.

“ We have three others that do execute the experiments so directed, and report them. These we call Inoculators.

“ Lastly, we have three that raise the former discoveries by experiments into greater observations, axioms, and aphorisms.<sup>2</sup> These we call Interpreters of Nature.

“ We have also, as you must think, novices and apprentices, that the succession of the former employed men do not fail; besides a great number of servants and attendants, men and women. And this we do also: we have consultations, which of the inventions and experiences which we have discovered shall be published, and which not: and take all an oath of secrecy, for the concealing of those which we think fit to keep secret: though some of those we do reveal sometimes to the state, and some not.<sup>3</sup>

“ For our ordinances and rites: we have two very long and fair galleries: in one of these we place patterns and samples of all manner of the more rare and excellent inventions: in the other we place the statua's of all principal inventors. There we have the statua

<sup>1</sup> *qui labores et collectiones priores penitus introspiciunt et quasi ruminantur.*

<sup>2</sup> The translation adds that this was only done after consultation with the whole body. *Quod faciunt non nisi consultatione et colloquiis prius habitis cum sociis universis.*

<sup>3</sup> *Etsi nonnulla ex iis, cum consensu, interdum Regi aut Senatui revelemus: illa autem omnino intra notitiam nostram cohibemus.*

of your Columbus, that discovered the West Indies : also the inventor of ships : your monk that was the inventor of ordnance and of gunpowder : the inventor of music : the inventor of letters : the inventor of printing : the inventor of observations of astronomy : the inventor of works in metal : the inventor of glass : the inventor of silk of the worm : the inventor of wine : the inventor of corn and bread : the inventor of sugars : and all these by more certain tradition than you have. Then have we divers inventors of our own, of excellent works ; which since you have not seen, it were too long to make descriptions of them ; and besides, in the right understanding of those descriptions you might easily err. For upon every invention of value, we erect a statua to the inventor, and give him a liberal and honourable reward. These statua's are some of brass ; some of marble and touch-stone ; some of cedar and other special woods gilt and adorned : some of iron ; some of silver ; some of gold.

“ We have certain hymns and services, which we say daily, of laud and thanks to God for his marvellous works : and forms of prayers, imploring his aid and blessing for the illumination of our labours, and the turning of them into good and holy uses.

“ Lastly, we have circuits or visits of divers principal cities of the kingdom ; where, as it cometh to pass, we do publish such new profitable inventions as we think good. And we do also declare natural divinations<sup>1</sup> of diseases, plagues, swarms of hurtful creatures, scarcity, tempests, earthquakes, great inundations, comets, temperature of the year, and divers other things.

<sup>1</sup> *Prædicimus etiam antequam advemant (id quod ad Naturales Divinationes pertinet) morbos epidemicos, &c.*

and we give counsel thereupon what the people shall do for the prevention and remedy of them."

And when he had said this, he stood up; and I, as I had been taught, kneeled down; and he laid his right hand upon my head, and said; "God bless thee, my son, and God bless this relation which I have made. I give thee leave to publish it for the good of other nations; for we here are in God's bosom, a land unknown." And so he left me; having assigned a value of about two thousand ducats, for a bounty to me and my fellows. For they give great largesses where they come upon all occasions.

[THE REST WAS NOT PERFECTED.]

KO HUNG ON THE GOLD MEDICINE AND ON THE  
YELLOW AND THE WHITE

THE FOURTH AND SIXTEENTH CHAPTERS OF PAO-P'U-TZŪ

Translated from the Chinese

BY LU-CH'ANG WU

with an Introduction, etc.

BY TENNEY L. DAVIS

Received August 6, 1935.

Presented March 13, 1935.

## INTRODUCTION

*Pao-p'u-tzū*, of which two of the most interesting chapters are now made available for the first time in a European language, is probably the widest known and highest regarded of the ancient Chinese treatises on alchemy. It has been preserved for us as part of the Taoist canon. It shows us the art matured by five or six centuries of practice, having its traditional heroes and an extensive literature, its technique and philosophy now clearly fixed, its objectives and pretensions established. This art the author examines in a hard-headed manner and expounds in language which is remarkably free from subterfuge.

*Ko Hung* (about 281-361 A.D.) was one of the outstanding scholars of the *Chin* dynasty, a Taoist philosopher and writer on medical, alchemical, literary, and historical subjects. He defended the Taoist doctrines at a time when they had not yet gained wide currency, and propagated them before Taoism had assumed a churchly organization. He believed in magic but probably no more so than his contemporaries. He was credulous but had the admirable credulity of an inquiring experimentalist who was well aware of the powers and possibilities of nature.

Alchemy arose in China during the third or fourth century B.C., apparently a spontaneous and indigenous growth out of Taoist mysticism.<sup>1</sup> The *Tao* or Way was to be attained by inaction. Those

<sup>1</sup> For a fuller account of the origins and growth of Chinese alchemy and of the alchemists who practiced the art before *Ko Hung* see *Isis*, 18, 210-230 (1932), the Introduction to Wu's translation of the *Ts'ao T'ung Ch'i* of *Wei Po-yang*.

who sought for it, despairing of accomplishing a perfect control of the self, tried physical means of attaining it, deep breathing, abstinence, and the use of medicines of immortality. Those who had attained the *Tao* became *Hsien*, supernatural immortals having eternal youth and other marvelous powers, capable of passing through fire and water without harm, of traversing great distances in a moment of time, of changing their forms at will, etc. On attaining complete inaction, they were capable of all or any action however extraordinary—in accordance with the usual dialectic of mysticism.

The notion of *Hsien* appears to have arisen naturally out of a discussion and elaboration of the philosophy of *Lao-tzū*. It seems to have been the central idea of Chinese alchemy. Recent evidence, in particular that which is supplied by the present translation and by *Wu's* translation of the *T'sun Tung Ch'i*, tends to support the early opinion of Edkins<sup>2</sup> who believed that European alchemy was derived from that of China, that Chinese alchemy reached the Arabs, and thence Europe, through Persia with which country the Chinese had intercourse both before and after its conquest by the Mohammedans. There is no evidence that alchemy existed in Europe, or in Byzantium or Alexandria, before the eighth century or thereabouts when the Arabs began to practice it—and the opinion of Martin<sup>3</sup> and more recently that of Johnson<sup>4</sup> that Chinese alchemy came to Europe through Byzantium and Alexandria cannot be accepted. Indeed the present translation supplies new evidence of the fundamental dissimilarity between the aims of the Chinese alchemists who sought to make real gold and silver artificially and those of the Alexandrian and Byzantine chemists who strove to tincture base metals to the appearance of the noble ones. The present translation also gives a very full picture of the notion of *Hsien*, which notion must surely have been attached to Chinese alchemy when it came to the Arabs. But the notion does not appear in European alchemy at all. Perhaps it failed to appeal to the European alchemists whose Mohammedanism and Christianity promised them an immortality anyway. They sought for an elixir of long life but not for a medicine of immortality, for the best of natural human powers but not for supernatural ones.

Ko Hung.

The notion however seems to have survived in Arab lore. The marvelous powers of the *Hsien* are so like those of the *jinn* of the Arabian Nights that one wonders whether the Arabic work, *jinn*, may not be derived from the Chinese *Hsien*.

*Ko Huang* was a voluminous writer. His most important work, the pseudonymous *Pao-p'u-tzu*,<sup>5</sup> dates from about 317-332 A.D., and consists of seventy chapters or books. The text occupies six volumes or fascicles of a recent edition of the Collected Taoist Classics, and is divided into two parts, each occupying three volumes, the "Outer Chapters," *H'ai-p'ien*, in fifty books, which deal with matters of politics and government from the Confucianist point of view, and the "Inner Chapters," *Yei-p'ien*, in twenty books, which treat of the immortals, alchemy, charms, exorcisms, etc. *Ko Huang* also wrote, evidently somewhat later, the *Shen Hsien Chuan* (Lives of the Immortals), ten books, which describes the lives of eighty-four *Hsien*. He wrote a large collection of medical recipes, *Chiu Kwei Yao Fang*, one hundred books; literary works, legends, funeral orations, poems, etc., one hundred books; fragments relating to his official business, thirty books; and treatises on the classics, historians, and philosophers, three hundred and ten books. The Taoist canon also contains a number of shorter tracts on hygiene, medicine, alchemy, and magic which are ascribed to him, some of them wrongly as Forke<sup>6</sup> believes. The history of the *Chiu* dynasty, which contains his biography, praises his extraordinary learning which was without equal. His writings are deep and very critical, and richer in content than the historical writings of *Sou-wei Ch'ien* and *Pao K'o*.

"Nowhere in *Pao-p'u-tzu's* book," says Waley,<sup>7</sup> "do we find the hierophantic tone that pervades most writings on alchemy both in the East and in the West. He uses a certain number of secret terms. . . . But his attitude is always that of a solidly educated layman examining claims which a narrow-minded orthodoxy had dismissed with contempt. He condemns those who are unwilling to take seriously either 'books that do not proceed from the school of the Duke of *Chou* or facts that Confucius has not tested.' "

<sup>5</sup> This name has been translated *Old Sober-Sides*, but Dr. Wu considers that it has no satirical intent and would better be translated *Solemn-Serious Philosopher*. The gentle smile in the portrait which is reproduced herewith perhaps agrees with its real intent.

<sup>7</sup> A. Waley, *Bulletin of the School of Oriental Studies, London Institution*, Vol. VI, Part 1, 24 pp. (1930).

*Ko Hung* was born at *Chiang-ning-fu* in *Kiangsu*. It is reported that he showed an extraordinary fondness for learning while still a boy but that his family was poor and he was obliged to chop wood in order to earn money for the purchase of writing materials. At some time after 326 A.D., he asked the Emperor *Yüan-ti* to send him to *Kuan-lou* because cinnabar, which he needed for his experiments, could be obtained there from Cochin-China. He set out on the journey but lingered in the neighborhood of Canton where he lived in the *Lo Fu* mountain studying and writing, and where he finally died. The account of *Ko Hung* in the *Lich Hsien Chüan chuan* (Complete Biographies of the Immortals) contains the following passage (trans. Wu) which indicates something of the tradition which later attached itself to him.

"One day *Ko Hung* addressed a message to the Governor of Canton stating that he would shortly start on a long journey in search of worthy teachers with whom to study. The Governor made haste to pay him a farewell visit. On that very day *Ko Hung* sat until noon when he died at the age of eighty-one years. He appeared only to have gone to sleep. When the Governor arrived he was already dead. Although dead, he looked alive and his body and limbs were soft. Upon being placed in the coffin, the body disappeared leaving the clothing behind it.

"In the *T'ang* dynasty, one *Tsui H'ci* met an aged woman beggar at the *Kai Yuan Tsu* monastery in *Nankai* who told him of her ability to cure goiters and gave him the medicinal herb, *I*. He later came to the knowledge that she was *Ko Hung's* wife."

In the chapter on the Gold Medicine *Ko Hung* names twenty-seven mountains which are "fit for profound meditation and the compounding of medicines." Besides these "there are large islands which are next in order as places good for the preparation of the medicine" (he names six), and, since "the famous mountains of the central part of the country are inaccessible," he names eight which are accessible. It may be that he visited some of these places. At any rate he is supposed to have lived and experimented on the hill at the West Lake in Hangchow, for the hill is now known as *Ko's Hill* and is surmounted by a Temple dedicated to him, a Medicine Pavilion, and a Shrine containing a stone tablet on which his portrait is carved. The carved portrait shows the same traits of physiognomy, the same beard, the same lines on the cheeks, and the same painted extra set of eyebrows as the other portrait which we have reproduced herewith.

SILK PANEL REPRESENTING A SCENE AT THE WEST LAKE IN HANGCHOW. THE HILL SHOWN IN THE BACKGROUND (NOW KNOWN AS *Ko's Hill*) IS ONE UPON WHICH *Ko Hung* IS SUPPOSED TO HAVE LIVED AND EXPERIMENTED. A TEMPLE AND A SHRINE ON THE HILL (NOT SHOWN IN THE PICTURE) ARE DEDICATED TO THE MASTER.

It was not customary for a Chinese alchemist to give instruction in the art to a member of his own family. *Ko Hung* therefore did not learn directly from his great-uncle, *Hsien Kung*, but learned from his great-uncle's disciple, *Cheng Chün*. *Pao-p'u-tzũ* states that *Hsien Kung* had been instructed by *Tao Yüan-Fang* who had received books on the Gold Medicine from a spiritual being. He lists the books on alchemy which *Hsien Kung* received from *Tao Yüan-Fang* and those which he himself received from *Cheng Chün*. He describes some of

KO'S HILL. THE TABLET SHRINE ON THE HILLTOP AT THE LEFT, THE MEDICINE PAVILION LOWER DOWN AT THE RIGHT.

the conversations which he had had with *Cheng Chün* concerning the principles of the art, and reports that *Cheng Chün* asserted that he and *Tao Chün* had accomplished a successful compounding. He tells in a circumstantial manner about his own instruction and explains his position in seeking the *Tao* and in writing on alchemy. He has always had a liking for unusual information and for things unorthodox. His Outer Chapters and miscellaneous writings in two hundred volumes he considers quite enough to speak his mind to posterity. In the Inner Chapters there are no rhetorical flourishes. He is sure of good results and of the truthfulness of his teachers. Although he

has not been able to make gold and silver himself, he works hard at his writing for the sake of interesting truth-loving scholars of the future in the study of the *Tao*.

His chapter on the Gold Medicine deals primarily with the preparation of the pill of immortality, and that on the Yellow and White primarily with transmutation—but the two subjects are ultimately the same, for the pill of immortality in certain cases is clearly nothing else but the artificially produced noble metal resulting from the transmutatory process. The Gold Medicine is sometimes the pill of immortality itself, sometimes the product of the transmutation, and sometimes the reagent, the "powder of projection" or the "tincture" as the European alchemists called it, which accomplishes the conversion of the base to the noble metal. In the chapter on the Gold Medicine *Pao-p'u-tzū* describes the preparation of the Nine Furnace-Pot Medicines, any one of which will make the user a *Hsien*, and of a large number of other medicines, of varying powers and efficacy, many of which he ascribes to other workers whom he names. Certain ones convert mercury, copper, and lead to gold, another converts lead to silver and to gold, and one in particular converts mercury into silver of such sort that this silver converts further lead into silver, in which respect it resembles the *ferment* of the Mediaeval alchemists. A certain medicine has the power of imparting immortality to one who eats and drinks out of vessels which are made of it, from which it would appear that the medicine is simply actual gold. The inference is verified by passages in the chapter on the Yellow and the White in which the eating of gold and silver is discussed, kneadable gold, and the relative merits of the gold and silver which are found in nature as compared with those which are made by alchemy. Natural and artificial gold and silver are the same, but the *Tao-shih* are too poor to buy the natural metals and find it more convenient to prepare them.

*Pao-p'u-tzū's* insistence upon the genuineness of the gold and silver of alchemy is especially important because of the light that it throws upon the difference between Chinese alchemy and Alexandrian chemistry. His discussion of make-believes shows that he was aware of the possibility of staining the metals and knew that the changes are only superficial and do not correspond to a real change of substance. Iron takes on the appearance of copper if it smeared with *Ts'ung Ch'ing*, and silver is given the yellow color of gold by the action of egg-white.

*Pao-p'u-tzū* speaks of the general ignorance of the art and of the

pretentiousness of those who are ignorant. He points out that vegetable substances are not suitable materials for the preparation of the medicine, for these, unlike *Tan Sha* (cinnabar), turn to ashes when they are burned. He mentions the necessity for offerings and ceremonials, for isolation from evil and disturbing influences, and for other precautions. He discusses the cost of preparing the medicine and the difficulty of procuring the reagents. He tells anecdotes of certain ones who accomplished, or tried to accomplish, the compounding, and supports his opinions by quotations from earlier sources and by mentioning wonderful things in nature which are well known to be possible. He points out that the secret names by which the substances are designated increase the difficulties, but gives what appear to be very straightforward descriptions of some of the processes. In the chapter on the Yellow and the White in particular, the apparatus and manipulation are sometimes described so clearly that a chemist could carry out the process himself if he knew what reagents to use.

The description of one process deserves special discussion, for it evidently concerns the preparation of stannic sulfide or "mosaic gold" and is perhaps the earliest known description of the preparation of this interesting substance. Mosaic gold exists in flakes or leaflets which have the color and the luster of gold, it does not tarnish, and is used at present for bronzing radiators, gilding picture frames and similar purposes. As *Ko Hung* describes the process, "tin sheets, each measuring six inches square by one and two-tenths inches thick, are covered with a one-tenth inch layer of a mud-like mixture of *Ch'ih Yen* (Red Salt) and *Huei Ch'ih* (potash-water, lime water), ten pounds of tin to every four of *Ch'ih Yen*." They are then heated in a sealed earthenware pot for thirty days with horse manure (probably with a smouldering fire of dried manure). "All the tin becomes ash-like and interspersed with bean-like pieces which are the yellow gold." The large portion of the metallic tin is converted into some ash-like compound or possibly into the ash-like allotropic modification, gray tin. A small portion of the tin is converted into bean-sized aggregates of flaky stannic sulfide. The yield is poor, for the author says that "twenty ounces of gold are obtained from every twenty pounds of tin used."

It seems likely that *Ko Hung* was personally experienced in the chemistry of tin, for the Chinese say that he was the first to make tin foil and that he made magic or spirit money out of it.

The present translation has been prepared from the *Ch'ang Hsün Sün Yüan* (701, 4881, 10024, 13752) edition of *Pao-p'u-tzū*, reprinted

and published by the Commercial Press, Ltd., Shanghai, China. The translator has divided it into paragraphs and these have been numbered for reader reference. It has been supplied with an Abstract and Table of Contents which will enable the student more readily to grasp the trends and ramifications of *Ko Hung's* argument and more quickly to find the passages which relate to particular points. When Chinese words are rendered in Roman letters, we have followed the spellings which are used in Giles' Chinese-English Dictionary, 2d ed., London, 1912. As this does not completely identify the words, we have printed, at the places of the first occurrence of the words in the translation, the numbers which correspond to the ideographs in Giles' Dictionary. Later occurrences are indicated in the Index of Chinese Words.

For financial aid in defraying the expenses of the preparation of the translation, we wish to make grateful acknowledgement of a grant from the Permanent Science Fund of the American Academy of Arts and Sciences.

## ON THE GOLD MEDICINE

THE FOURTH OF THE INNER CHAPTERS OF *Pao-p'ü-tzû*

## TRANSLATION

1. *Pao-p'ü-tzû* (8709, 9512, 12317) says: Thousands of books on the cultivation of the nature of man and on the art of everlasting sight have I perused, and every one of them have I found to have nothing other than the *Huan Tao* (5047, 10618) (Returned Medicine) and *Chin I* (2032, 5509) (Gold Fluid) as its main subjects of discourse. From this it may be concluded that these two things are the supreme achievements of the *Hsien Tao* (4449, 10780) (The Immortals' Way, The Way to Immortality). If the eating of these two things does not transform the eater into a *Hsien* (4449), then there could never have been any *Hsien* in the past.

2. There was a time when the country was in tumult and the people fled for safety in all directions. I for one toured through the lands of *Hsü* (4748), *Yü* (13078), *Ching* (2157), *Hsinü* (4206), *Chiang* (1208), and *Kuang* (6397), where I met hundreds of *Tao-shih* (10780, 9892) (Seekers of the Way). Some of them had been known to me through their high reputations. However, all of them were alike in their superficial understanding and in their ignorance even. Every one possessed several tens of volumes of books, but these had been copied only for keeping's sake and were never thoroughly understood. Ever so often these people would profess to have acquired the art of *Hsing Chi* (4624, 1064) (the art of directing the movement of the ethereal essence in one's own body) and of thriving on a non-cereal diet of medicinal herbs.

3. All the formula books were very much alike. Every one of the *Tao-shih* had a copy of the *Tao Chi Ching* (10780, 787, 2122) (Book of the Secrets of the Tao) and held it to be the most valuable. Yet these people were so ignorant about the book as erroneously to ascribe its authorship to *Yin Hsi* (13270, 4073). So I set them aright by telling them that it was the work of *Wang Tsu* (12493, 12128), a military inspector-general of the *Wei* (12567) (403-241 B.C.) dynasty, who was no ancient but just our own contemporary. *Wang Tsu* knew nothing about the great medicines, and he was merely attempting to direct the *Chi* (ethereal essences in one's body) into the "chamber of achievement" when he wrote the Book of the Secrets of the Tao, declaring it to be the complete revelation of the Tao. This is indeed very misleading.

4. Upon questioning the *Tao-shih* on the *Shên Tao* (9819, 10618)

(Divine Medicine) and the *Chin I* (Gold Fluid) and on the invocation of *T'ien Shên* (11208, 9819) and *Ti Hsien* (10956, 4449) (Heavenly God and Earthly Spirit), I found that they did not seem to know anything about these things. The majority of them were mere charlatans, who lied to the world when they said that they had been living long among the *Hsien*. As a matter of fact none of them really knew the secrets of the *Tao*. Those of them who had heard something about the Gold Medicine seemed to agree in thinking that its secrets were known only to the ancients who had since become *Hsien*. They did not believe that the Medicine could still be prepared. Again, some of them had secured certain useless formulas and superficial treatises—but never the real book. However, all these people invariably declared that they possessed everything about the art of the Medicine.

5. It was *Tao Yüan-Fang* (11753, 13744, 3455) who, in the midst of profound meditation in the *T'ien Chia Shan* (11208, 2533, 9663) (Sky Pillar Mountain), was given volumes of the divine books on the Gold Medicine by some spiritual being. It was then the close of the *Han* (3836) (206 B.C. to 220 A.D.) dynasty when the land was rife with disturbances. So he fled across the river to come south with the idea of practicing the *Tao* in some famous mountain. From him my great uncle, *Hsien Kung* (4449, 6508), received the *T'ai Ch'ing Tao Ching* (10573, 2188, 10618, 2122) (Book on the Supremely Clear Medicine) in three volumes, the *Chia Ting Tao Ching* (2263, 11268, 10618, 2122) (Book on the Nine Furnace-pot Medicine) in one volume, and the *Chin I Tao Ching* (2062, 5509, 10618, 2122) (Book on the Gold Fluid Medicine) in one volume. My great uncle in turn passed the books on to his disciple, *Ch'eng Chün* (724, 3269). *Ch'eng* was too poor to buy the necessary medicines for the compounding. I had been serving him as a disciple for a long time when we went to the *Ma Chi Shan* (7576, 801, 9863) (Horse Footstep Mountain). There, at an altar especially erected for the purpose and with an oath, I received the book, some magical formulas, and the "Unprinted Magical Formulas." This last book was not known to be in existence until *Tao Yüan-Fang* gave it to my great uncle, who gave it to *Ch'eng Chün*, who in turn gave it to me. No other *Tao-shih* ever knew of it.

6. It has been more than twenty years since I got the books. Being poor I could only lament the want of means to make trial of the compounding. Yet there are those who have caskets full of gold and mountain-piles of money and know nothing of this art of immortality. They would not believe it even if they heard about it. How unfor-

tunate for these people! Just as one would feel the insipidity of ordinary food only after having tasted a well-flavored dish and sense the smallness of hillocks only after having seen the *K'un Lun* (6537, 7496) Mountain, so would one look down on the common recipes after having learned of the *Chin Tau* (2032, 10618) (Gold Medicine). But the Great Medicine is difficult to compound properly, and so one sometimes has to fall back on the preparation of lesser medicines which are more easily secured. However, the eating of thousands of ratties of substances other than the Great Medicine is of little beneficial effect and will not bring immortality to the eater. That is why *Lao-tzu* (6783, 12317) remarked that one's efforts would be of no avail unless he succeeded in obtaining the *Hsun Tau* or *Chin I*. Even common cereals are capable of supporting the lives of the people; with them they live, without them, they die. How else could it be but that the Divine Medicine would be ten thousand times as efficacious!

7. The more the Gold Medicine is heated, the more exquisite are the transformations it passes through. Yellow gold will not be changed even after long heating in the fire, nor will it rot after long burial in the earth. The eating of these two medicines will therefore so strengthen one's body that he will not grow old and die. This is a case of deriving strength from an external substance, comparable to the maintenance of a fire by oil and the protection of the leg from rotting in water by a smear of *Tung Ch'ing* (12285, 2184) (Copper Blue). The Gold Medicine which is to be taken internally is even more effective in nourishing and protecting the body than Copper Blue which merely acts on the surface.

8. Numerous are those in the world who do not believe in the *Tao*. There may be a few who do, but they are not so fortunate as to have set eyes on the practice of the Art or even to have heard about it from an accomplished teacher. For the enlightenment of these people I have herewith made a brief transcription of some practical directions for the practice of the Art. The seeker of the *Tao* should not be satisfied with ordinary methods, thinking that they will suffice to bring him immortality.

9. Upon learning the Art one will feel as if he had just come out of a filthy cesspool into the open sea, or left the firefly for the sunlight and moonlight—just as the hearing of peals of thunder makes one feel the insignificance of the roll of the drum, and the sight of a whale makes one feel the smallness of ordinary fish.

10. The attempt at subliming poor medicine is like driving a lunc

donkey in pursuit of fast-blowing wind or sailing a basket-like vessel on the high seas.

11. There are numerous minor methods of various kinds for the compounding of the medicine. The efficacy of the medicine compounded does not depend merely on the recipe followed in its making, but varies as well with the degree of working to which it has been subjected. The order of efficacy of the medicines compounded according to various recipes of different values may be reversed on account of different degrees of working, just as wine obtained from a single processing can not be compared with that obtained from nine.

12. However low in value a minor medicine may be, it is still far superior to the best of vegetable substances. For vegetable substances turn to ashes when burned. But *Tau* (10618) (Medicine), when acted upon by heat, gives quicksilver; and, after passing through other changes, it returns to *Tau Ska* (10618, 9620) (Red Sand, Cinnabar). How greatly different from vegetable matter! This is understood only by the *Shên Hsien* (9819, 4449) (Spiritual Beings) who are far superior to common people.

13. In this world there are few who are well-informed and many who harbor misgivings about the *Tau*. Many do not even know that mercury comes out of *Tau Ska*. When told, they still refuse to believe it, saying that *Tau Ska* is red, and how can it produce a white substance? They also say that *Tau Ska* is a stone, and that stones upon heating invariably turn to ashes, and how can *Tau Ska* be expected to behave otherwise? These are but simple truths and yet they are beyond their comprehension. What wonder then that they should laugh at the *Hsien Tao* when told.

14. For the sake of the teachable ones of posterity, the *Chên Jên* (589, 5624) (Truth Men, Sages) of antiquity transmitted a method by which they might be freed from the misery of death. These are indeed words of truth. Even these are looked upon by people of the world as unfounded. How can the words be unfounded when the nine turns and nine transformations (in the preparation of the Medicine) appear several times in a day exactly in accordance with the prescription? The way by which the *Chên Jên* arrived at the truth is indeed beyond common people's reach!

15. Since my youthful days I have had a liking for the Art. I travelled all distances and braved all hazards in my eager search for the Truth. Whenever I succeeded in obtaining some unusual piece of information, I would feel gladdened at heart despite people's ridicule.

16. Not that I want to be known to the world through a book of

strange thoughts and fanciful imagination, but that for the sake of those among people of the future who will appreciate, I am writing this—knowing that all those of later times will be of inferior calibre. Just as the highest degree of *Yang* (12883) (Positiveness) will not revive what is decayed and the greatest mind will not be able to enlighten the most stupid, so books are comprehensible only to those who understand and things are valuable only to those who can appreciate. Give a bow of decoration to a farmer, and he will use it to chase birds away from his farm; give an emperor's robe to a southern barbarian and he will wear it to carry wood. They are simply ignorant. What else can be expected of them?

17. People of the world idle their time away. They neither apply themselves to literary pursuits nor to works. They waste away their lives in pursuit of fame and profit. They may be busy running after official positions in the capital or they may be indulging in wine, woman, song, or the chess, squandering their valuable time to the detriment of their health. Stunned would they be when told of the supreme *Tao*, and bored to dozing by the sight of writings on the *Tao*. They do not take proper care of their nature-given persons. Instead, they seek for their dissipation, ending in death. They do not go after the art of life-cultivation. Of course, those who do not know and value the *Tao* cannot be expected to force it on these unwilling people.

18. People often say that if immortality were attainable, then the wealthy ones among the wise of antiquity would have attained it. In putting forth the argument, these people do not seem to realize that wealthy people of all ages are alike; being disbelievers and not seeking the *Tao*, they concentrate their attention on their immediate needs. How then can they be expected to attain the *Tao*?

19. Even if one does not believe firmly in the possibility of life extension and of becoming a *Hsien*, what is there to deter him from making a trial of the Art? If only a slight success should come of the trial and he should gain thereby two or three centuries of life, would not this slight extension of one's life be far superior to the fleeting existence of the mass?

20. Of the numerous things in this world, the Art and the *Tao* are the most difficult to comprehend. How then can people of ordinary endowment pass the judgement that there cannot possibly be a way to immortality? If one harbors doubts about the *Tao* merely because of popular disbelief, then he is assuming the mass to be wise people. How numerous then will the wise ones in this world be! Furthermore, those who understand the *Tao* and work for its attainment—are they

not the most stupid, even more stupid than common people? Many fear to attempt to seek for immortality, lest they should fail and expose themselves to ridicule as victims of folly and deception. But supposing that common people are not infallible and that their idea about the *Tao* is one mistake they make among ten thousand sound judgements, will not those who have laughed be laughed at by the ones who succeed despite discouragement and ridicule? Even the sun and the moon cannot shine on everything; how can the people's mind be so omniscient as to be entirely trustworthy?

21. *Pao-p'u-tz'u* says: It is written in the *Huang Ti Chia Ting Tao Ching* (5124, 10942, 2263, 11268, 10618, 2122) (The Yellow Emperor's Book on the Nine Furnace-pot Medicine) that *Huang Ti* was elevated to a *Hsien* after eating the medicine. Although the proper method of breathing and directing the movements of the *Ch'i* (ethereal essence) of the body, and the eating of vegetable medicine, may extend people's life, yet they will not keep people from death. But the eating of the *Shên Tao* (Divine Medicine) confers immortality on the eater, enabling him to last as long as heaven and earth and to ride on clouds and dragons up and down the *T'ai Chiing* (10573, 2188) (Great Clearness).

22. *Huang Ti* transmitted the book to *Hsüan-tz'u* (4790, 12317), cautioning him that the *Tao* was of great moment and should therefore be made known only to the upright and virtuous and not to any undeserving person even if he were wealthy. He who is ready to follow the *Tao* should send gold effigies as a token of homage, and gold fish into the water which flows eastward, and should besmear his mouth with blood as a sign of allegiance to the cause. No one who is not endowed with bones of *Shên Hsien* will be able to perceive the *Tao*.

23. The medicine should be prepared on a famous mountain, in a lonely spot, with only two or three persons present. The compounder should be on a diet for one hundred days previously and should perfect the purification and anointment of the body with the five perfumes. Meanwhile, strict avoidance of proximity to evil things and complete isolation from vulgarity should be observed. Those who are not believers in the *Tao* and would ridicule the undertaking should be kept in ignorance of it; otherwise the preparation will fail. When the medicine is made, not only will the successful manipulator be immortal, but all the rest of his family will become immortal as well. Common people do not use this method of preparing the *Shên Tao*, preferring instead to use materials of vegetable origin, not knowing that these substances, being themselves subject to decay and destruction when placed in the earth or upon heating, cannot prolong people's lives.

24. The nine preparations, which are so essential to the attainment of immortality, are not what persons of common stamp will ever see or hear of. Those people, numbering millions and millions, stupidly seek for riches and honors and these only. Are they not merely walking corpses?

25. Worship is in order when compounding the medicine. There are separate volumes of diagrams and directions for the service of worship.

26. The first medicine is called *Tan Hua* (10618, 5005) (Medicine Flowers). To begin with, *Hsuan Huang* (4790, 5124) (Black and Yellow, Heaven and Earth, etc.) should be gotten ready. A mixture should be made of some tens of catties of each of *Hsiang Huang Shui* (4099, 5124, 10128) (arsenic sulfide water?), *Fan Shi Shui* (3409, 9964, 10128) (alum water?), *Jung Yen* (5746, 13112) (a red or black salt?), *Lu Yen* (7423, 13112) (niter or potash?), *Yü Shih* (13527, 9964) (a white ore of arsenic?), *Mu Li* (8089, 6970) (chalkstone?), *Ch'ih Shih Ch'ih* (1967, 9964, 1792), *Hua Shih* (5022, 9964) (soapstone?), and *Hu Fên* (4930, 3519) (white lead?). The mixture is then sealed with Six-one Mud. The medicine obtained by thirty-six days heating will confer immortality on the eater in seven days. When mixed with black fat and heated in a strong flame, the medicine will soon turn to yellow gold. This may also be obtained by heating two hundred and forty liangs (ounces) of the medicine with one hundred catties of quicksilver. If yellow gold fails to appear, heating should be repeated and then it will certainly be obtained.

27. The second medicine is called *Shên Tau* (Divine Medicine) or *Shên Fu* (9819, 3687) (Divine Charm) and confers immortality on the eater in a hundred days. He will be able to walk in fire and water uninjured. With this medicine smeared on the soles of his feet he will be able to walk on water. The eating of three knifebladesful of the medicine will kill off all sorts of worms in the body to the end that the eater will be free from all diseases.

28. The third medicine is called *Shên Tau* (Divine Medicine). Whoever eats one knifebladesful of it will become an immortal in one hundred days. Even domestic animals will attain immortality by eating it. It has the power to ward off the five kinds of soldiers. A hundred days after the medicine has been eaten, the *Hsien*, the maids-in-waiting of the spiritual realm, the ghosts and spirits of the mountains and rivers will all come in the form of human beings to wait on the person who has eaten it.

29. The fourth medicine is called *Huan Tau* (Returned Medicine).

Immortality will come to the eater in a hundred days after eating. Above him will hover pheasants, peacocks, and red birds, and at his side will be fairies. Yellow gold will be formed immediately by heating a knifeblade-ful of the medicine admixed with a catty of quicksilver. Whoever has his money painted with it will have it back on the same day that he spends it. Words painted with this medicine on the eyes of common people will keep spirits away from them.

30. The fifth medicine is called *Êk Tan* (3343, 10618) (Food Medicine). Immortality will come to its eater in thirty days. Ghosts and spirits will wait on him and fairies will come to his side.

31. The sixth medicine is called *Lien Tan* (7152, 10618) (Refined Medicine). It transforms the eater into an immortal in ten days. Upon heating with quicksilver, it also gives yellow gold.

32. The seventh medicine is called *Jou Tan* (5653, 10618) (Soft Medicine). Whoever eats a knifeblade-ful of it will become an immortal in a hundred days. The eating of this medicine together with *Ch'ueh P'in Chik* (3250, 8850, 1789) (Imperfect Basin Juice) is so efficacious as to restore the reproductive activity of an old man of ninety. When heated with *Chia Kuang* (2032, 6568) (lead?) it will give yellow gold.

33. The eighth medicine is called *Fu Tan* (3691, 10618) (Latent Medicine). It brings immortality to the eater on the very day that he eats it. The keeping of a quantity of the medicine about the size of the kernel of a date fruit will ward off all evil spirits. Doors with words painted in this medicine will keep off all devils, spirits, thieves, robbers, tigers, and wolves.

34. The ninth medicine is called *Hau Tan* (3825, 10618) (Cold Medicine). Whoever eat a knifeblade-ful of it will become an immortal in a hundred days. There will come angels and fairies to wait on him. He will be light of body and will be flying on wings.

35. All these nine medicines need not be eaten. It will be sufficient to eat one of them in order to be a *Hsien*. The choice as to which one among the nine is left to the discretion of the aspirant. Whoever eats any of the medicines may rise on high or stay in this world according to his desire. He becomes invulnerable and is free to move everywhere.

36. *Pao-p'u-tzu* says: There is also the *T'ai Ch'ing Shen Tan* (10573, 2188, 9819, 10618) (Supreme Clear Divine Medicine) which originated with *Yüan Chün* (13744, 3269) who was teacher to *Lu-mo-tz*. Of the nine chapters in the *T'ai Ch'ing Kuan T'ien Ching* (10573, 2188, 6363, 11208, 2122) (Supreme Clear Observe Sky Book) the

first three cannot be taught, the middle three are not deserved by the world and should therefore be destroyed, but the last three in three separate volumes are books on the medicine.

37. *Yüan Chün* is a great spiritual being who can harmonize *Yin-Yang* (13224, 12883) (The Two Contraries, Negative and Positive, Female and Male, Soft and Hard, etc.), command ghosts, spirits, winds, and rain, drive the nine dragons and twelve white tigers, and lord over all the *Hsien*. Even this great one was not born with all his powers but acquired them by following the *Tao* and eating the medicine. How can common people expect to get powers otherwise?

38. Says the Book: Among those who have acquired the *Tao*, the best ones will be raised on high to be officials in the skies, the mediocre will congregate on the *K'un Lun* mountain, while the lowest class will be living in this world as immortals. Common people, disbelieving the *Tao*, do things to court death day and night. How can nature be expected to force them to live when they themselves do not seek to do so? One should guard against telling those who care only for delicious food, fine clothes, pleasing tones, pretty faces, wealth, and rank to satisfy their desires to the fullest measure. They will ridicule the *Tao* and the real books on the medicine. He who thus erringly lets out the secrets of the *Tao* will be afflicted with misfortune. To those who have devout faith in the *Tao* some of the medicine may be given but not the directions for making it.

39. He who has attained the *Tao* will have no use for being a prince. For, once the medicine has been prepared, he will not only become an immortal by eating it but he will also be able to make gold out of it. When it has been prepared, a grand offering of a hundred catties of the medicine should be made to the various gods and spirits. The directions for the ceremony of offering are given in another volume and are different from those for the nine furnace-pot offering.

40. The hundred catties of the medicine for the offering are to be apportioned as follows: twenty for worshipping the skies, five for the Sun and five for the Moon, eight for the Great Dipper, eight for the Supreme Monad, five for the well, five for the oven, twelve for *Ho Po* (3036, 9340), five for *Sü* (9803), five for the Spirit of the Gateway, five for the Street-gateway, and five for *Ch'ing Chün* (2188, 3269). The remaining twelve catties should be put in a good leather wallet to be taken on a propitious day at a busy hour to the market, where the material is quietly and unnoticedly disposed of at various places. The one who performs this should not look back at what he has left behind. Whatever is in excess of the one hundred catties will be

available for spending. Misfortune will befall the maker of the gold unless he makes offerings of it to the spirits before spending any of it.

41. The Book says further: The Way to immortality does not lie in the worshipping of and doing service to the spirits, nor in the art of bending and unbending. What is necessary in order to be a *Shên* (9819) (a god, a diety) is the *Shên Tzu* (Divine Medicine), which is not so easy to know of and still more difficult to make.

42. Recently, *Hsin Yeh Yin Chün* (4574, 12989, 13224, 3269) of the closing years of the *Han* dynasty succeeded in making this *T'ai Ch'ing Tzu* (10573, 2188, 10618) (Supreme Clear Medicine) and with it became an immortal. He was a Confucian of parts, adept at poetical composition and the writing of commentaries on books and on the medicine. From his pen (brush) came also an account of his early experiences in learning the *Tao* from a certain teacher and of forty people whom he personally knew to have been transformed into spiritual beings.

43. The preparation of this Supreme Clear Medicine is more difficult than that of the Nine Furnace-pot Medicine. However, it is the means to make one raised on high in broad daylight. Before starting the fire for the compounding, *Hua Ch'ih* (5005, 1983) (Flower Pond), *Ch'ih Yeu* (1967, 13112) (Red Salt), *Kên Hsueh* (5972, 4845), *Hsüan Pü* (4790, 8556) (Black-White), *Fei Fu* (3483, 3687), and *Sau H'u Shên Shui* (9552, 12098, 9819, 10128) (Three-Five Divine Water) should be made.

44. The eating of the medicine of the first turn will bring immortality in three years, that of the second turn in two years, of the third in one year, of the fourth in one-half year, that of the fifth turn in one hundred days, of the sixth in forty, of the seventh in thirty, of the eighth in ten, and of the ninth in three days.

45. When the medicine of the ninth turn is placed in a Divine Furnace-pot in the sun sometime after the summer solstice until the pot becomes hot, and then a catty of *Chu Êk* (2544, 3333) (Red Substance) is placed under the lid, it will be noticed by a couching observer, after the sun-spirit has shone on it for a short time, that the substances are raised in dazzlingly brilliant divine lights of rainbow colors. That is the Returned Medicine, the eating of a knife-bladeful of which will raise the eater to the skies in broad daylight.

46. The medicine of the ninth turn may be sealed in a kettle and heated by sawdust, gently at first and then strongly. The speed of transformation is variable from the first change to the ninth. The medicine of fewer turns is less efficacious and will confer the state of

*Hsiao* on its eater only after a lapse of time. The medicine of more turns is more powerful and will do the same in less time.

47. There is also the *Chiu Kuang Tau* (2263, 6389, 10618) (Nine Light Medicine) prepared according to the *Chiu Chuan I Fa* (2263, 2711, 5505, 3306) (Marvellous Method of Nine Turns). This is similar to the one just described. In its making the several medicines are fired together so as to turn the five stones, which are, namely, *Tau Sha* (cinnabar), *Hsiung Huang* (4699, 5124) (arsenic sulfide?), *Pai Fan* (8556, 3409) (white alum), *Tseng Ch'ing* (11735, 2184) (a blue compound of copper?), and *Jui Shih* (5723, 9904). Each stone can make five turns of five different colors. The five stones together can give twenty-five different colors. One liang (ounce) of each should be placed in separate vessels.

48. To resuscitate a person who has been dead for less than three days, bathe the body in a mixture of a knifeblade-ful of *Ch'ing Tau* (2184, 10618) (Blue Medicine) and water, and feed him with another knifeblade-ful. Under such treatment he will be immediately raised from the dead.

49. He who has his left hand painted with some of the black medicine admixed with a little water will be able to get whatever he desires.

50. If one desires to disappear at will, to foresee the future, to tell fortunes, to have eyesight covering thousands of miles, and to be immortal, he needs only to partake of a knifeblade-ful of the Yellow Medicine. All these are to be found in the middle volume of the *T'ai Ch'ing Ching* (10573, 2188, 2122) (Supreme Clear Book).

51. *Pao-p'u-tzu* says: There is also the *Wu Ling Tau Ching* (12698, 7222, 10618, 2122) (Book on Five Efficacious Medicines) in one volume, which treats of five methods. The materials to be used are *Tau Sha*, *Hsiung Huang*, *Ts'ü Huang* (12397, 5124) (arsenic sulfide?), *Tseng Ch'ing*, *Liu Huang* (7245, 5124) (sulfur), *Fan Shih* (3409, 9904) (alum?), *Ts'ü Shih* (12407, 9904), *Jung Yen*, and *T'ai I Yu Liang* (10573, 5341, 13615, 7016) (Remains of Provisions of the Supreme Monad). With *Liu I Ni* (7276, 5342, 8197) (Six-one Mud) these are to be compounded in a divine chamber with proper ceremonies, offerings, and worship. The medicine is made in thirty-six days. A *H'u Ti* (12698, 10942) (Five Emperors) charm painted with the medicine in five colors has the power to bring about immortality. However, this is not as efficacious as the medicines prepared according to the Supreme Clear Method or the Nine Furnace-pot Method previously described.

52. The *Min Shan* (7910, 9663) (Min Mountain) Method is due to *Chang Kai Ta* (416, 5784, 10489) to whom it was revealed in the midst of his profound meditation in a stone chamber in the *Min* Mountain. It is as follows: A vessel of *Huang T'ung* (5124, 12285) (Yellow Copper, Brass?) for the reception of water from the moon is covered with quicksilver and the spirit of the sun is allowed to fire its inside. Repeated eating of the medicine thus prepared will bring immortality. This medicine may be further treated with *Hsiang Huang* in a sunlight-concentrator of copper (bronze) under a covering of quicksilver and exposed to sunlight for twenty days. When a pea-size quantity of the medicine thus prepared is swallowed with some water, if a blind man takes it, he will regain his sight in a hundred days; if an invalid, he will recover his health in the same lapse of time; if a hoary head, his hair will turn black again; and if short of teeth, new ones will grow in place of those which had fallen.

53. In the preparation of *Hu-w-eh'eng-tz'ü's* (12790, 762, 12317) medicine, *Huan Sha Hung* (5047, 9624, 5266) (Return Sand Mercury) is placed in an eight-inch copper (bronze?) plate, which rests on three points of an earthenware stove containing burning charcoal. To the contents of the copper plate sulfur is added from time to time so as to maintain a pasty condition. It takes one hundred days to complete the preparation of the medicine, an elixir.

54. *Hsien-wên-tz'ü's* (4546, 7751, 12317) medicine is prepared by having a mixture of one part of *Tao* and three parts of wine exposed to the sun for forty days. On the first day of eating, the three kinds of worms and all maladies are banished. By eating it regularly for three consecutive years one attains the *Tao*. There will come two fairies to wait on him. His will be the power to get whatever he desires. All spirits and dead ones are kept from doing any harm in the presence of this medicine.

55. The *Li Ch'eng Tao* (6054, 762, 10618) is similar to the Nine Furnace-pot *Tao* but is not as efficacious. One way of preparation is to fire *Tz'ü Huang* and *Hsiang Huang* to get copper for casting into a vessel, which is then inverted over some three-year old wine. Red stalagmites of less than an inch in length or five-colored precious stones will appear inside the vessel in a hundred days. These are then removed and placed for some time in the earth to obtain the elixir. By eating this medicine with the sap of *T'w Ssü* (12124, 10259) one gains the power to transform himself into anything he desires. He who swallows the medicine together with some *Chu Ts'ao* (2544, 11634) (Red Herb) is empowered to walk on emptiness. The Red Herb, *shên*

found in caves, is similar to the small date and attains a height of three or four feet when full-grown. Its branches and leaves are all red and its stems are like corals. When tapped, its sap flows out like blood. By adding jade, the eight stones, gold, and silver to the sap, a thick paste is obtained which may readily be made into pills. On standing the thick paste changes to a liquid which is called *Yü Li* (13630, 6950) (Sweet-wine of Jade).

56. Again, there is the *Ch'ü Fu Tan* (3118, 3727, 10618). In the famous *Tan* (medicine, red) rivers, such as the *Tan* river of *Nan Yang* (8128, 12883), there are *Tan* fishes at night-time ten days before the summer solstice, at which time they are found to be swimming along the borders of the waters with their dazzling colors shining through like blazing fire. They should then be caught in nets. However, only a portion of the catch should be taken and the rest should be returned to the water. He who has his feet painted with the blood of such fish is thereby enabled to walk on the surface of water and to live in the deeps.

57. The preparation of the medicine according to *Ch'ih-sung-tzū* (1967, 10449, 12317) is as follows: *Tan*, covered with the sweat of an old mud container made of vegetable fiber, and the juice of "alum peach" are sealed in a waterproof vessel, which is then buried three feet below the surface of the earth for a hundred days. When mixed with the juices pressed from the red seeds of the *Chu* (2606?) tree and eaten, this medicine will bring redness to the features and hair as well as immortality. It is not improbable that the Red Beards among the Yellow *Hsien* were eaters of this medicine.

58. In *Shih Hsien Shên's* (9964, 4440, 9865) preparation, the young unfledged "black birds" are fed with real *Tan* and beef. When grown up, they have red down and feathers. They are then to be killed and crushed together with their feathers. A knifebladeful of this medicine taken internally will bring a long life of five hundred years.

59. The medicine of *K'ung-fêng-tzū* (5908, 3554, 12317) is compounded by mixing *Tan* with "sheep black," crane's eggs, fowl's blood, *T'ien Hsiung* (11208, 4699), and juice of Mount *Shao Shih*. The mixture is then sealed inside the shell of an egg of the *Ku* (6248) (heron) and soaked in *Yün Mu Shui* (13812, 8067, 10128) (mica water?) for a hundred days. A dose of one tenth of a quart of the red liquid thus obtained prolongs life for ten years and a quart of it brings a long life of a thousand years.

60. According to *Ts'ü-wên-tzū* (11917, 12633, 12317), the medicine

obtained by stuffing *Tau* inside the *H'u* (8085) (a kind of duck) effects an extension of life when swallowed occasionally and brings immortality when eaten regularly.

61. *Liu Yüan* (7270, 13744) prepared his medicine by soaking *Tau Sha* in *Hsüan Shui* (4790, 10128) (Black Water, Mystic Water) for a hundred days. It turns purple and will not soil the hands. It is next mixed with *Yün Mu Shui* (mica water?), sealed in a tube, and placed in a well. At the end of a hundred days the mixture is transformed into a red liquid. When taken internally, one tenth of a quart of this medicine enables one to live a thousand years; habitual drinking of it brings immortality.

62. In preparing his medicine, *Lo-ch'ang-tzū* (7331, 450, 12317) placed some *Tseng Ch'ing*, *Ch'ien Tau* (1733, 10618) (Lead Red), quicksilver, and *Tau Sha* in a copper vessel. This is then sealed with dry tile and white soapstone (slate?) and heated in white sand for eighty days. By swallowing a pea-size quantity of this medicine, one will attain the state of a *Hsien* in three years.

63. In *Li H'üan's* (6884, 12633) preparation *Tau* is wrapped in raw silk and boiled in bamboo sap to get the Red Springwater. This is then floated on water and cooked. A potion of one tenth of a quart of a mixture of this medicine with *Hsüan Shui* will bring about the state of *Hsien* in a year.

64. The preparation of the medicine according to *Yin-tzū* (13270, 12317): Have a mixture of *Yün Mu Shui* (mica water?) sealed in a vessel to be buried in a Gold Flower Pond for a year. A catty of this medicine ingested in knifebladeful doses confers on the eater a long life of five hundred years.

65. The compounding of the *T'ai I Chao Hun P'o Tau* (10573, 5341, 466, 5244, 9420, 10618) (The Supreme Monad's Medicine for the Summoning of the Spirit) is similar to that of the *Chiu Kung Tau* (The Nine Light Medicine) in the use of the five stones and the sealing of the vessel with Six-one Mud. When swallowed with a *Liu Huang* (sulfur) pill and some water, this medicine has the power of reviving persons who have been dead for three days or less. Life comes back to these persons instantly. Those who have been revived in this manner invariably tell the story that they followed the beckoning of a messenger on their return to this world.

66. The *Ts'ai Nü Tau* (11504, 8419, 10618) is prepared by cooking *Tau* with hare's blood and honey for a hundred days. He who swallows pills of this medicine of the size of a dryandra seed, one pill at a time and three times a day for a hundred days, will have two fairies at his service.

67. To prepare the medicine of *Chi-ch'iu-tzū* (904, 2310, 12317), clear and colorless wine, sesame oil, sweet-wine of a hundred blossoms, and dragon fat, enclosed with *Liu I Ni* (Six-one Mud), are heated for ten days by a flameless fire of husks. The ingestion of this medicine in pea-size doses will bring a long life of five hundred years.

68. In compounding *Mo-tzū Tan* (8022, 12317, 10618), mercury and Five Stone Fluid are cooked for ten days in a copper vessel with stirring by an iron ladle. A knifebladesful of the Returned Medicine thus obtained is sufficiently potent as a panacea. Habitual ingestion brings immortality.

69. When lead, mercury, *Tseng Ch'ing*, and water are sealed together and cooked in red millet seeds for eighty days the *Chang-tzū Ho Tan* (416, 12317, 3945, 10618) is obtained. Regular ingestion of pea-size pills made of this medicine and some date meal for a hundred days brings a long life of five hundred years.

70. The elixir of *Ch'i Li* (998, 6870) is a five-colored medicine compounded by cooking the five-stones, snow, *Tau Sha*, and mercury in a large copper vessel for a hundred days.

71. By firing together a hundred knifebladesful of the *Ch'i Li* medicine and a hundred catties of lead, white silver will be obtained. Upon firing it with *Hsiang Huang* for a hundred days, yellow gold is formed which, if too hard, may be softened by boiling with lard, and if too soft, may be hardened by boiling with some white plums.

72. The *Yü Kwei Tan* (13630, 6435, 10618) is made in the following manner: *Tan* is moistened with saliva and placed between two layers of a mixture of *Tseng Ch'ing* and sulfur powder in a bamboo pipe which is heated in a sand bath for fifty days. He who has taken this medicine internally for a hundred days will have fairies and spirits (such as those who have control over the elements, etc.) at his service and he will be a seer.

73. In making the *Chou Hou Tan* (2474, 4025, 10618) saliva and *Tan* are mixed, sealed in dry tile, and cooked for eighty days. A pea-size quantity of the substance obtained is then stirred in the sun so that the light coming from it mixes with the sunlight. A pea-size amount of this medicine is enough to bring about immortality. When fired in copper of *Tan Yang* (10618, 12883), this medicine is transformed into gold.

74. The medicine of *Li Kung* (6884, 6568) is prepared by mixing *Chên Tan* (589, 10618) (Real Medicine) with one quart each of the waters of the five-stones so as to form a thick paste. After firing in a caldron for thirty-six days, *Shih Liu Huang I* (9964, 7245, 5124,

5509) (Stone Sulfur Liquor) is added and mixed. Ten years' regular ingestion of the medicine thus prepared will enable a man to last as long as the sky and the earth.

75. To compound the medicine of *Liu Shêng* (7270, 8065), *Tau* admixed with the juices of the *Ti Ch'u* (10956, 2649) herb, the *Ch'u* (2627) tree, and chrysanthemum flowers is heated for thirty days and then ground to a powder. A year's eating of this medicine will bring a long life of five hundred years. If the eater be an old man, he will be rejuvenated beyond recognition; if a youth, he will not grow old.

76. The medicine of *H'ang Chün* (12493, 3269) is made as follows: *Pa Ska* (8510, 9624) and mercury are sealed in eggs, which are then brooded by a hen. Ageing and decay of the human body will be avoided by eating three such eggs on a propitious day. Children should not be allowed to swallow them, else they will be stunted in their bodily development. The same result obtains with new-born chickens, dogs, and all other fowls and animals.

77. The preparation of the medicine of *Ch'ên Shêng* (658, 9865) consists of sealing some white honey and *Tau* in a copper vessel, which is then placed in the water of a well for a year. The eating of this medicine protects one from hunger for a year. The consumption of a catty of the medicine makes one live a hundred years.

78. The medicine of *Han Chung Chung* (3827, 2900, 2894) is made by cooking honey and *Tau* in a sealed vessel. He who eats it will have his life prolonged, the strength of his eyesight improved, and no shadow cast from his person when standing in the sun. Besides the methods of preparation of the medicine just described, there are still others, which, however, need not be discussed here.

79. *Pao-p'u-tzũ* says: *Chün I* (Gold Fluid) is what *T'ai I* (10573, 5341) (the Supreme Monad) swallowed and was thereby transformed into a *Hsien*. Its efficacy is no less than that of the nine medicines. In its making one pound (old weight) of yellow gold is sealed in a vessel together with *Hsüan Ming Lung Kao* (4790, 7946, 7479, 5936) (Dark Clear Dragon Grease), *T'ai I Hsün Shou Chung Shik* (10573, 5341, 4864, 10014, 2875, 9964) (Stone in the Head of the Supreme Monad), *Ping Shik* (9277, 9964) (Ice-Stone), *Tzũ Yu Nü* (12329, 13423, 8419) (Purple Itinerant Damsel) *Hsüan Shui I* (4790, 10128, 5509) (Dark Water Fluid), *Chiu Hua Shik* (2032, 5001, 9964) (Gold Petrified Stone), and *Tau Ska*. The mixture changes into a fluid in a hundred days. According to the *Chên Ching* (589, 2122) (Real Book), the swallowing of the Gold Fluid causes the whole body to assume a gold color. *Lao-tzũ* transmitted the secret to *Yüan Chün*, saying

that the *Tuo* was of great import and that, since it came to light only once in about a hundred years, he should preserve the secret well in a stone chamber inside a special building by the side of an eastward-flowing stream on the side of a celebrated mountain. The process occupies a hundred days, during which time the compounder should be dieting and be isolated from the mass. A dose of a liang (ounce) of the medicine will transform one into a *Hsien*, who however shall remain in this mundane world and shall be known as a *Ti Shui Hsien* (10956, 10128, 4449) (An Immortal of the Earth and Waters). In order to be raised to the skies, one must abstain from eating cereals for a year before swallowing the medicine. One-half liang of the medicine will bring immortality and immunity from all evils and maladies. He will be able to raise a family and to rank in officialdom to the full of his desires. Those who desire to ascend to the skies should diet and should swallow an ounce of the medicine.

80. The method of *Chia I Wei Wei Hsi Chü Sheng Fa* (2032, 5709, 12521, 12582, 4073, 3003, 9876, 3366): After cooking for thirty days, a mixture of *Chia I* (Gold Fluid) and quicksilver is placed in a yellow earthen jar, which is then sealed with Six-one Mud and strongly heated for sixty hours. Thereupon the medicine is obtained. The swallowing of a pea-size quantity of the medicine is enough to make a *Hsien* out of any person. Silver is obtained by sprinkling a knife-bladeful of this medicine onto a catty of quicksilver. When a catty of the medicine is placed over a fire and fanned, red gold is obtained, which will flow and is called *Tau Chiu* (10618, 2032) (Medicine Gold). Swords besmeared with this medicine have the power of checking enemies at a distance of ten thousand miles. By eating and drinking out of vessels made of this medicine, one will attain immortality. The medicine may be exposed to the sun and moon to obtain a liquid which is also an elixir. When a mixture of the Gold Fluid and Yellow Earth is strongly heated in a jar made of Six-one Mud, it is entirely changed into serviceable yellow gold.

81. When the latter is again heated *Tau* is obtained, a pea-size dose of which is potent enough to make one a *Ti Hsien* (Earthy Spirit, an Immortal of the Earth) in celebrated mountains and great rivers. Silver is obtained when a knife-bladeful of this medicine is sprinkled onto quicksilver. When an ounce of this silver is mixed with a catty of lead the entire mass is changed into silver. He who desires to get the classic on the Gold Fluid and the magic chant must throw eight ounces of gold into an eastward flowing river and must take an oath by smearing his lips with blood. No success will come

to him who obtains the secrets in an irregular way. Even to those who are professedly the most credulous, only the medicine should be given but not the classic which deals with its making. The indiscreet giving of the classic will bring misfortune both to the giver and to the recipient. For the gods watch over us closely without our knowledge.

82. *Pao-p'u-tzû* says: True it is that the nine medicines are the best of *Hsien* medicines. Yet the materials for their compounding are quite numerous. They are easily procurable only in large cities which have good facilities for communication, but are not to be obtained at other places. Furthermore, in the compounding of the medicines, the fires should be tended for tens of days and nights with industrious application and close adjustment, which is a great difficulty. The compounding of the Gold Fluid is much easier. There the only thing which is difficult is to get the gold. One pound in the old measure is equivalent to two in our contemporary measure. Such a quantity of gold would cost only some three hundred thousand cash. The other auxiliary materials are easy to procure. In the compounding, no fire is required. All that needs to be done is to have the mixture in a *Hua Ch'ih* (Flower Pond) for the necessary number of days. A total expenditure of four hundred thousand cash will make an amount large enough to transform eight persons into *Hsien*. Just as no wine is formed by the fermentation of small quantities of rice, so small quantities of materials will not be able to interact to give the medicine.

83. *Pao-p'u-tzû* says: Again there is the *Êrh Huang Chiu* (3343, 5124, 2032) (Pool of Yellow Gold) which, although not as good as Yellow Gold, is yet by far better than other medicines. Gold may be refined by the use of pig's skin and hide fat, or by treatment with the bark of the *Ch'u* herb, or by having it pulled out into sheets, or by transforming it all at once into a fluid. Again *Hsiung Huang* and *Tz'û Huang* may be used to treat the gold to yield something stretchable like skin. All these are but methods of the *Ti Hsien* (Immortal of the Earth).

84. Both silver and large pearls of the oyster can be made into water, which is a medicine that will not keep and will bring immortality only through frequent ingestion. So it is not as good as the Gold Fluid.

85. *Pao-p'u-tzû* says: In compounding the Gold Fluid and the Nine Medicines, it is necessary not only to spend money but also to carry out the work in celebrated mountains in complete isolation from

the work-a-day world. That is why few persons are successful in it. The printed word is sure to spread. Since such secrets should be guarded from the mass, so books on the *Tao* should never deal with the Gold Medicine.

86. In compounding the medicine the chief thing to be guarded against is the ridicule of the disbeliever. For such derision is sure to prevent the success of the compounding. According to the words of *Ch'eng Chiu*, he who attempts the compounding of this medicine must make offerings to the gods, from among whom *T'ai I* (Supreme Monad), *Yüan Chün*, *Lao Chün* (6783, 3269), and *Hsüan Nü* (4790, 8419) will come to watch over the operations. If the compounder should let stupid people of the world know of his doings by not working in a secluded place, the gods would withhold their blessings, whereupon the evil *Ch'i* (ethereal essence) would enter to spoil the medicine. In order to be successful the compounder must work in a famous mountain retreat in isolation from the mass. He should practice dieting, refraining from the five stimulant foods, namely, *Ts'ung* (12021) (leeks), *Suan* (10381) (garlic), *Chiu* (2279) (scallions), *Liao Hao* (7067, 3871) (smartweed), and *Ch'ieh* (1525) (mustard), and from raw fish, for a hundred days before beginning to work and continued until the medicine is done.

87. *Ch'eng Chiu* says that, according to what he heard from *Lao Chün*, the attempted preparations of the Gold Fluid and the Divine Medicine should never be made in small mountains, where there are no real gods but spirits of trees and stones, aged things of ten thousand years and bloodthirsty demons. These are devils who work not for the good but for the evil of man. They attempt to lead seekers of the *Tao* astray into temptation. The seekers should protect themselves and their retainers against these devils who may do harm to their medicines. In preparing good medicines, medical men of today guard against the sight of chickens, dogs, children, and women, lest the efficacy of their medicines be destroyed by the evil sight of these things. Likewise, dyers guard their goods from the sight of the evil-eyed, lest the beautiful tints be spoiled. What wonder then that the great medicines of the gods should be closely guarded? That is the reason why seekers of the *Tao* since ancient times do their compounding not in ordinary but in famous mountains.

88. According to the *Hsüan Ching* (4449, 2122) (Book of Immortals), the mountains fit for profound meditation and the compounding of medicines are as follows: *Hua Shan* (5005, 9663) (*Hua* Mountain), *T'ai Shan* (10596, 9663), *Hu Shan* (3979, 9663), *H'eng*

*Shan* (3019, 9663), *Sung Shan* (10458, 9663), *Shao Shih Shan* (9746, 9974, 9663), *Ch'ang Shan* (450, 9663), *T'ai Pai Shan* (10573, 8556, 9663), *Chung Nam Shan* (2894, 8128, 9663), *Nü Chi Shan* (8419, 837, 9663), *Ti Fei Shan* (10956, 3497, 9663), *Wang Wu Shan* (12493, 12737, 9663), *Pao Tu Shan* (8709, 12065, 9663), *Au Ch'iu Shan* (44, 2310, 9663), *Ch'ien Shan* (1739, 9663), *Ch'ing Ch'ung Shan* (2184, 763, 9663), *O Mei Shan* (8430, 7714, 9663), *Sui Shan* (10392, 9663), *Fün T'ai Shan* (13812, 10577, 9663), *Lo Fu Shan* (7291, 3646, 9663), *Yang Chia Shan* (12883, 1154, 9663), *Huang Chiu Shan* (5124, 2032, 9663), *Pieh Yen Shan* (9154, 11826, 9663), *Ta T'ien T'ai Shan* (10470, 11208, 10583, 9663), *Hsiao T'ien T'ai Shan* (4294, 11208, 10583, 9663), *Kai Chu Shan* (5784, 2616, 9663), *Kuo Ts'ung Shan* (6288, 11596, 9663). In these mountains there are true gods and perhaps *Ti Hsien* (Immortals of the Earth). On them grows the *Chih Ts'ao* (1788, 11634) (Herb of Longevity). These mountains are good, not only for compounding medicines, but also as refuges from military and other dangers. Those who have attained the *Tao* will be helped to success by the gods in their attempts at compounding the medicines.

89. Besides the mountains before-mentioned, there are large islands which are next in order as places good for the preparation of the medicines, namely, *Tung W'ang Chou* (12248, 12667, 2445), *Tau Chou* (10641, 2445), and *Chu Yü* (2006, 13523) in the district of *Hui Chi* (5184, 884), *Yang Lü Chou* (12842, 7320, 2445), *T'ai Kwang Chou* (10306, 6380, 2445), and *Yü Chou* (13535, 2445) in the district of *Hsi Chou* (4748, 2444).

90. The famous mountains of the central part of the country are inaccessible. The accessible ones are *Ho Shan*, *Au Ch'ang Shan* (44,450, 9663), and *T'ai Pai Shan* which are in the district of *Au Yang* (44, 12883), and *Ssu Wang Shan* (10291, 12509, 9663), *Ta T'ien T'ai Shan*, *Hsiao T'ien T'ai Shan*, *Kai Chu Shan*, and *Kuo Ts'ung Shan* which are in the district of *Hui Chi*.

91. *Pao-p'u-tz'u* says: Although I come from a family of high officials, I have no ability to manage affairs of state. Yet I could have attained fame and high official rank if I had followed the footsteps of my kinsmen who, although far less accomplished than I, have risen high in officialdom. For the sake of writing and compounding the Divine Medicines for the attainment of immortality in far-away mountains, I have left behind me my people and worldly honors. People of the world look askance on my abandonment of officialdom and on my isolation from the mass to take up the labor of farming. Some even say that I am out of my mind. But it should

be remembered that the *Tao* and the affairs of the world are incompatible. How could I seek for the *Tao* without abandoning worldly affairs? When sure of his convictions, one acts accordingly with determination, unaffected by praise or by blame, by encouragement or by dissuasion from others. I write of my intentions so as to make them known to men of the same mind of the future. Men of determination who come after me will have to make sacrifices similar to mine.

92. The *Hsiao Shên Tou Fang* (4294, 9819, 10618, 3435) (Formula of the Lesser Divine Medicine) is as follows: Three catties of Real *Tao* and six catties of white honey are mixed and cooked in the sun until the mass can be made into pills. Within a year after consuming a dose of some ten pills of the size of sesame seeds, gray hair will turn black, fallen teeth will be replaced by new ones, and robustness will spread all over one's appearance. Frequent swallowing of the pills will bring rejuvenation and immortality.

93. The *Hsiao Tou Fa* (4294, 10618, 3396) (Method of the Lesser Medicine): One catty of *Tao*, after proper grinding and sieving, is thoroughly mixed with three quarts of bitter wine and two quarts of lacquer. The intimate mixture is heated over a gentle fire until it can be made into pills. The swallowing, daily for thirty days, of three pills of this medicine of the size of sesame seeds will cure the hundred sicknesses and dispel the three demons (one in the brain, one in the heart, and one in the abdomen; they cause the diseases in people). He who continues swallowing the medicine for a hundred days will have strong bones and sinews. He who does it for a thousand days will have his name engrossed on the list of the immortals and will last as long as heaven and earth. Form and complexion change irregularly. The sun and the moon become full by turns. He will not cast any shadow in the sun, for he will give off a special light.

94. The *Hsiao Êrh Huang Chin Fa* (4294, 3343, 5124, 2032, 3396) (Method of the Lesser Food of Yellow Gold): Refined gold is placed in clear wine and boiled until, when squeezed in the hand, it comes through between the fingers like mud. If the mixture does not boil, or if it does not come through between the fingers, the gold should be cut into smaller pieces and then boiled again with wine. He who swallows one shot-size pill of the medicine, or two small ones of half that size, daily for thirty days will be cared for by the gods and fairies. Silver may be used instead of gold in the preparation of the medicine. He who eats these two medicines will attain buoyancy of movement if he lives in a stone chamber in a famous mountain, and

he will be an immortal of the earth if he stays among the mass. This secret should not be divulged without discretion.

95. The *Liang-i-tzŭ Êrh Hsiao Huang Chin Fa* (7010, 5455, 12317, 3343, 4297, 5124, 2032, 3366) (Method of the Food of Reduced Yellow Gold of *Liang-i-tzŭ*): Three catties of hog's skin and adhering fat, one quart of clear bitter wine, and five ounces of yellow gold are heated in a vessel in an earthen oven. The gold will make a hundred entrances and a hundred exits from the fat. So will the wine. A dose of one catty of the medicine will bring immortality; one-half catty, two thousand years of life; and five liangs (ounces), twelve hundred years of life. There is no limit to the quantity of the medicine to be eaten, but propitious days should be chosen for its eating. The secret should not be divulged to others, else the medicine cannot be prepared successfully.

## ON THE YELLOW AND THE WHITE

THE SIXTEENTH OF THE INNER CHAPTERS OF *Pao-p'u-tzū*

## TRANSLATION

1. *Pao-p'u-tzū* says: *The Shên Hsien Ching* (9819, 4449, 2122) (Book of Spiritual Beings, Book of Deities and Immortals) dealing with *Huang P'ai* (5124, 8556) (The Yellow and the White) comprises twenty-five volumes of over a thousand sections. The Yellow is gold and the White is silver. Unwilling to mention them outright, the ancients spoke of these substances enigmatically so as to keep the valuable *Tao* in secrecy. Sometimes they entitled their writings *K'eng Hsien* (6001, 4564), which also means gold. Most of the writings are difficult to comprehend, while only a very small part of them is definitely understandable. Common people seem to think that the *Tao* is merely fictitious. Such misgivings are the same thing as disbelief in *Shên Hsien*.

2. Sometime ago, as a disciple of *Ch'eng Chün*, I received the *Chiu Tan Chün* (2263, 10618, 2122) (Book of Nine Medicines), the *Chiu Yin I Ching* (2032, 13252, 5509, 2122) (Book of Gold and Silver Fluid), and the *Huang P'ai Chung Ching* (5124, 8556, 2875, 2122) (Middle Book of the Yellow and the White) in five volumes.

3. *Ch'eng Chün* said that he and *Tso Chün* (11753, 3269) had attempted the compounding with success in *T'ung Shau* (12285, 9063) (Copper Mountain) on the *Lu Chiang* (7396, 1208) (Lu River). The diligence and hardships sustained from dieting, purification, and abstinences are no different from those incidental to the compounding of *Chiu Tan* and *Shên Hsien Yao* (9819, 4449, 12058) (Divine Medicine, Medicine of Spiritual Beings).

4. Most people ridicule me for my liking for things unorthodox. They take me to be queer for attempting to understand the incomprehensible. But why should I do so? Am I writing on these things just for the sake of leaving some works behind me when I am gone? But that is unnecessary, for my Outer Chapters and miscellaneous writings in two hundred volumes are quite enough to speak my mind to posterity. Moreover, in the Inner Chapters there are no rhetorical flourishes but mere plain outspoken words. I am also aware of the fact that the treatment of such matters will be looked upon by people of the world as being far-fetched. It is not comparable in the winning of popular appreciation to a treatment of the tangible affairs of the vulgar world. The reason why I do not refrain from writing on the subject, knowing that it will not be accorded proper reception by the

world, is that I am sure of good results and of the truthfulness of my teachers.

5. On account of the poor facilities for communication in the land, and of my poverty, misfortune, and lack of means, I have not secured the necessary medicines for the compounding. Yet here I am telling people that I know how to make gold and silver while I myself remain poverty-stricken. Is this not like the case of a man who sells medicines for curing lameness while he himself cannot walk? How can people be expected to be convinced? However, such arguments are not infallible, and we may grant exceptions in certain cases. I work hard at weaving in black and white simply for the sake of interesting curious and truth-loving scholars of the future in the study of the *Tao*.

6. The art of transformation is indeed omnipotent. People's persons are ordinarily observable, yet there are means for their concealment. Ghosts and spirits are not usually to be seen, yet they may be caused to appear. Many are those who cannot execute such performances.

7. Water and fire, which are in the sky, may be gotten by means of the *Yang Shui* (12883, 10416) (a light-concentrator of a copper alloy). *Ch'ien* (1733) (lead), which is white, can be reddened into *Tau* (red, redness, medicine). *Tau*, which is red, can be whitened into *Ch'ien*. Clouds, rain, frost, and snow, which are ethereal-essences of the sky, can be exactly duplicated from medicines.

8. The flying, the running, and the crawling beings are all of definite forms. Yet all of a sudden they may discard their original forms and be changed into other things. Man is the noblest of all creations; yet cases are not a few wherein he is transformed into a crane, a stone, a tiger, a monkey, a turtle, or even into sand. As to the formation of abysses from high mountains and the making of peaks out of deep valleys—such are but changes of the great earth. Transformation is inherent in the nature of heaven and earth. Why then should we think that gold and silver cannot be made from other things? For, are the fire obtained by the *Yang Shui* and the water gotten from the *Fang Chu* (3435, 2571) (a shelled creature) any different from ordinary fire and water? Dragons formed from snakes and grease made from *Mao Ts'ou* (7689, —) (a kind of vegetable growth) are no different from natural dragons and grease. The causes of all these lie in the responsive inspiration and incorporation of the spirit of creation. One cannot know the ends of such transformations unless he has thoroughly comprehended the reason and

nature of things. Nor can he tell of the phenomena unless he can trace matters to their beginnings and ends.

9. Narrow-minded and ignorant people take the profound to be uncouth, and relegate marvels to the realm of fiction. To these people, anything that has not been spoken of by *Chou Kung* (2450, 6568) or Confucius, or is not to be found in the Classics, is untrue. Is this not narrow-mindedness and ignorance?

10. People of the world think that the *Tao* does not exist just because *Liu Hsiang* (7270, 4283) did not succeed in attaining it. One may as well maintain, because of a crop failure from drought or from flood, that no harvest is possible from the cultivation of cereals.

11. Magistrate *Wu Ta Wên* (12748, 10470, 12633) of *Ch'ing Tu* (762, 12050), a learned and cultivated man, related that as disciple of *Li Kên* (6884, 5974), the *Tao-shih* (Seeker of the Way, Man of the Art), he saw him heating a mixture of *Ch'ien* (lead) and *Hsi* (tin). To this was added a big pea-size quantity of medicine. Upon stirring with an iron ladle and cooling, silver was obtained. Having gotten the secret formula, *Wu Ta Wên* attempted the compounding himself. However, being an official in active service, he could not perform the one hundred day dieting and purification necessary for his success—and so ended in failure. And so he exclaimed that this world was not worth living in!

12. *Huan Chün Shou* (5075, 3209, 9663) relates the following: *Ch'eng H'ei* (757, 12528) of the *Han* dynasty had a liking for the art of the Yellow and White. He married a lady from a *Tao-shih* family. Once *H'ei* was commanded to serve his sovereign as a retainer on a trip. However he lacked appropriate attire for the occasion and was therefore deeply grieved. Thereupon his wife came to his help by uttering the incantation, "Pray send forth two measures of silk." Forthwith appeared the desired fabric.

13. One day *H'ei* was attempting the compounding of the medicine according to the *Chên Ch'ung Huang Pao* (630, 2875, 5269, 8720) (The Great Treasure in the Pillow-Chest), a formula-book of *Huai-san-tz'ü* (5034, 8128, 12317), and was without success when his wife approached him and found him fanning a fire under a pot of quicksilver. She said, "Let me try my hand at it." With these words she sprinkled into the pot a small quantity of some medicine from a wallet. After a short while, silver was obtained. Highly astounded *H'ei* demanded of his wife why hadn't she enlightened him on the *Tao*. She replied that the *Tao* was to be attained only by those who are especially blessed. Failing in his attempt to extract the desired information

from his wife at the price of luxurious food and clothing, he tried by the advice of a friend to force her to yield the secret under the whip. Still the obdurate wife held her own, declaring that the *Tao* was to be revealed only to the appropriate persons. If they were the proper persons, the *Tao* would be revealed to them by the accomplished even if they were absolute strangers. If they were not of the right kind, they would not obtain the secrets of the *Tao* from the accomplished even by inflicting the penalty of piecemeal dissection of his body. But *Wei* kept on with his coercion until his wife ran about in madness with her body covered with mud and finally died.

14. As an instance from recent times we may consider the case of *Hua Ling Sui* (5005, 7199, 10271), a talented, learned, and well-informed scholar who had been skeptical about things not found in the classics. However he once came across a *Tao-shih* who professed to have knowledge of the method of the Yellow and the White. He asked the *Tao-shih* to make good his words by deeds, which were as follows: *Ch'ien* (lead) was treated in an iron vessel with a certain powdered medicine and silver was obtained. The silver was further treated with some other medicine and gold was made. *Hua* also learned from the *Tao-shih* the art of penetrating-sight. After less than a hundred days practice he was able while lying in bed to have a very clear view of the skies and the surroundings of his house as if there had been no intervening roof and walls. He was able to hold conversation with his dead concubine as if she were alive. He heard the deities, to whom he had paid homage, returning courtesy to him when his bed seemed to be astir with some noise. And so *Hua* exclaimed that there was no limit to the possibilities of things in this world. Things not recorded in the classics should not be arbitrarily dismissed as untrue. It was natural for *Hua* who had not learnt of the Art to be astonished by such things.

15. The conditions for compounding the Yellow and the White are similar to those for compounding the *Shih Tao* (Divine Medicine). More than a hundred days of dieting and purification are required. The formula-books should be thoroughly understood and then the suitable formulas should be chosen for execution. The compounding is beyond the vulgar, the uncleanly, and the untalented who aspire to magical proficiency. The methods should be learnt directly from the accomplished. The compounding should be done in clean places in mountainous recesses so as to keep vulgar fools in ignorance. *Liu Hsiang* tried the compounding in the palace with the help of courtiers. In that case the conditions of dieting, purification, and isolation were not fulfilled. How then could he be successful?

16. According to the *Huan Tan Hsin Ch'uan* (5075, 10681, 4574, 3183): During his premiership *Shih Hsin Chien* (9893, 4562, 1671) was supplied with officials, attendants, and slaves to facilitate his attempt at gold-making. He met with no success. The failure was ascribed to his own inability. Having no use for more money, the Empress did not care much about the compounding at first. But she became eager for it when told of its power of life extension. And so she made him a *Lang* (an official rank), allowed him to live in the north palace, and treated him as a special delegate. How could the divine medicine be prepared in a palace by persons so numerous, vulgar, and improper!

17. Even ordinary dyers at work avoid the sight of people lest their dyeings be spoiled. How much more fastidious must we be while performing the art of the Yellow and the White!

18. In doing things, be they small or great, it is necessary to get at the essentials. Otherwise, even such trivial things as the making of simple food can not be carried out with success—not to speak of greater things.

19. Once I queried *Ch'ang Ch'ün* saying, "*Lao Ch'ün* has put forth the maxim that no high value ought to be placed on precious things which are difficult to obtain. Now in time of peace and plenty gold is allowed to waste in the mountains and jades in the valleys. Why then should sages of old so value gold and silver as to leave behind them formulas for their making?" To this *Ch'ang Ch'ün* replied, "*Lao Ch'ün* was referring on the one hand to those who in their desperate effort to obtain gold to gratify their pleasure of appreciation and wasteful decoration and even to attain longevity would scan sands, break stones, tear down mountains, dry up deep waters, defy long distances and precipices and drowning, and go to other excesses to the detriment of people's useful work, and on the other hand to those profiteering businessmen who in their hot pursuit of wealth for the indulgence of their senses would do away with the virtues of faithfulness and fair play and risk their lives over waters and precipices. It is another story with the *Ch'iu Jen* (Men of Truth, Men Proficient in the Art, Sages). For they make gold with the purpose, not of getting rich, but of becoming *Hsien* by eating it. Therefore it is written in the Book, 'Gold can be made wherewith people can be raised above this worldly life.' Silver may be eaten for similar ends but is not as effective as gold."

20. Then I asked further, "Why should we not eat the gold and silver which are already in existence instead of taking the trouble to make them? What are made will not be real gold and silver but just make-believes."

21. Said *Ch'eng Ch'iu* in reply, "The gold and silver which are found in the world are suitable for the purpose. But *Tao-shih* are all poor; witness the adage that *Hsien* are never stout and *Tao-shih* never rich. *Tao-shih* usually go in groups of five or ten, counting the teacher and his disciples. Poor as they are, how can they be expected to get the necessary gold and silver? Furthermore they cannot cover the great distances to gather the gold and silver which occur in nature. The only thing left for them to do is to make the metals themselves.

22. "In that they are the essences of the medicines, the gold and silver made are superior to those found in nature.

23. "Says the *Hsien Ching* (Book of Immortals); The refined spirit of *Tau* changes into gold. This is the theory of the formation of gold from *Tau*. This is why gold is usually to be found underneath where *Tau* occurs.

24. "The gold obtained by successful compounding is uniform inside and out. It may be put through a hundred workings without suffering any change. Therefore it was written in the formulas for its making that it may be made into nails. That shows its strength. Such results come of responsive infusion of the *Tao* of nature. Why should such deeds be called make-believes?

25. "Make-believes should be like the besmearing of iron with *Tai'ng Ch'ing* whereby the metal takes on a reddish sheen simulating copper, and the action of egg-white on silver to obtain a yellow coloring resembling gold. In all these cases there are merely external changes but no internal transmutations.

26. "The fungus *Chih* (1788) (Plant of Longevity) is a natural growth. But according to the *Hsien Ching* it may be cultivated by means of the five stones and the five plants. The resulting plant will be exactly like that found in nature in the power of giving long life when eaten. The case is similar to the making of gold. The *Ch'ên* (656) (shellfish, clam) resulting from the transformation of the *Chih* (1870) (the ringed pheasant) and the *Ko* (6058) (a frog, also bivalves of various kinds) from fowls are no different from those found in nature.

27. "Therefore the *Hsien Ching* says, 'When the flowing pearl is going through the nine turns the father does not speak to the son. They come into harmonious relations when the Yellow and the White are obtained.' And, 'Those *Tao-shih* are great who attain the state of *Hsien* through the eating of the gold obtained from *Chu Sâ* (2544, 9620) (Red Sand). They are the middle class who attain immortality by eating the *Chih* and by proper direction of the movement of the

*Chi* (ethereal essence) in their bodies. They are the inferiors who attain long lives of a thousand years or less through eating vegetable and plant matter.' Again, 'It is in the nature of things that gold and silver can be made. It is within the ability of people to learn to attain immortality.'"

28. The *Yü T'ieh Chi* (13630, 11122, 923) (The Jade Tablet Records) says, "All the people in this wide, wide world are potentialities for making into immortals. Failure comes from hesitation. The gold obtained by the condensation of silver may be made into nails."

29. The *P'ung Chu Ching* (12285, 2533, 2122) (The Copper Pillar Book) says, "*Tau Sha* can be made into gold. *Ho Chi* (3936, 574) (River Chariot) can be made into silver. The making can be done readily and the resulting substances are real. Once an adept in the Art a person will be able to become a *Hsien*."

30. *Huang-shan-tz'u* (5124, 9663, 12317) says, "There is gold in nature. But that I can make too. Two Yellow and one Red, an unmistakable certainty."

31. Say the inscriptions on the Tortoise Shells, "My life is within my own control and not heaven's. The gold obtained from the Returned Medicine will bring about a long life of thousands upon thousands of years."

32. Certainly the ancients cannot be telling us untruths when they agree so well.

33. *Jung Yen* (a red or black salt?) and *Lu Yen* (niter or potash?) which are such cheap things in time of peace are now unobtainable at any price whatever. *Chiang Li* (1264, 6870) and *Shih Tau* (9064, 10629) cannot be obtained even at a price of thousands of cash per pound. Under such conditions those who know the methods are just as badly off as those who do not. What a deplorable situation!

34. Those who know the methods are usually too poor to get the means of compounding. Rich people do not know the processes. They may not believe in the Art if they happen to know of it. Granting a fair degree of faith, they will not usually part with any portion of their great accumulation of gold and silver to buy the necessary medicines for the compounding—for such action would be like releasing birds already in the cage in chase of those flying at large. Even if they are sure of profit in the enterprise, the hardships to be endured in dieting and in purification of the body will still be too much for them.

35. It is not wise to make attempts at compounding without learning the methods directly from famous teachers. Ordinary

medical recipes are obviously simple. Yet secrecy is thrown over the efficacious recipes which are in common use. In those formulas there appear such names of substances as *Hou Kung Yu Nü*, *Pi Tsé Chih Chiao*, *Fêng Chün Ni Wan*, *Mu Kwei Tzû*, *Chün Shang Chih*, *Fei Chün Ken*, *Fu Lung Kan*, *Pai Ma Han*, *Fu Yün Tzû*, *Lung Tzû Tan I*, *Yeh Kuang Ku*, *Pai Hua Li*, and *Tung Tsou Tsui*. The substances referred to are commonplaces which nevertheless cannot be identified without knowledge of the code concerned. Similar considerations obtain even to a much more intensified degree in the Art of the Yellow and the White.

36. Those who are adepts in the Art keep it a secret not merely because of its high value. Once the *Tao* is attained, immediately there comes immortality which is the highest achievement of the *Tao*. That is why it was so highly esteemed by the ancients.

37. The medicines mentioned in the formula-books may be common medicines under different disguise. For instance, *Hô Shang Chai Nü* (3936, 9729, —, 8419) (Maiden on the River) (Mercury?) has no reference to a woman, nor *Ling Yang Tzû Ming* (7228, 12883, 12317, 7946) to a man, nor *Yü Yü Liang* (13618, 13615, 7016) (Remnants of the Rations of Emperor Yü) to rice, nor *Yao Chiang* (12907, 1210) (Fluid of Emperor Yao) to water.

38. People usually misinterpret formulas, mistaking *Lung Tan* (7479, 10629) (Dragon's Gall), *Hu Chang* (4920, 421) (Tiger's Palms), *Chi T'o* (810, 11441) (Chicken's Head), *Ya Ché* (12826, —) (Duck's Feet), *Ma T'i* (7576, 11016) (Horse's Hoofs), *Ch'üan Hsüeh* (3192, 4847) (Dog's Blood), *Shu W'ei* (10072, 12001) (Rat's Tail), and *Niu Hsi* (8346, 4140) (Ox's Knees) for animal substances, mistaking *Ch'üeh Pei* (3250, 8782) (Broken Cup), *Fu P'au* (3723, 8850) (Inverted Basin), *Fu Li* (3739, —) (Axes), *Tu Chi* (10470, 928) (Big Lance), *Kwei Chien* (6430, 1617) (Ghost's Arrows), and *T'ien Ku* (11208, 6148) (Sky Hooks) for iron and earthenware, and misinterpreting *Hu Wang Shih Ché* (4030, 12493, 9896, 542) (Delegate from the King of the Tartars), *I Ku Hsin Fu* (5355, 6209, 4574, 3749) (Bride-leaning-on-the-mother-in-law), *Yeh Wên Jên* (12989, 12633, 5624) (Rural Literati), *Shou T'ien Kung* (10012, 11236, 6568) (Old Man in Charge of a Field), *Tai Wên Yü* (10567, 12633, 13638), and *Hsü Ch'ang Ch'ing* (4748, 450, 2198) as the names of persons. Even common plants are sometimes not recognizable. Who can be expected to understand the mysterious formulas? It is not surprising that *Liu Hsiang* did not succeed in obtaining gold. When the essence of the Art is apprehended, no great talent will be needed but mere

common people will be successful in making the medicine. *Liu Hsiang* was no mere common person; he failed simply because he did not know how to decipher the code of names.

39. Some concise and effective formulas are given below for the benefit of fellow aspirants of the future. Five pounds or more of *Wu Tu Hsiang Huang* (12744, 12050, 4699, 5124), which is red as a cock's comb, lustrous, and free from admixed stone, is powdered, mixed with *Niu Tan* (8346, 10629) (Ox's Gall) and heated to dryness. The bottom of a one-bushel red-earthen pot is covered alternately, first with a three-tenths inch layer of powdered *Jung Yen* and *Shih Tan* (Stone Gall), then a half-inch layer of the powdered *Hsiang Huang*, and then another layer of *Jung Yen* and *Shih Tan*, and so on until all of the material has been exhausted. On top of this a two-inch layer of date-stone-sized pieces of burning charcoal is placed. Another pot is then inverted over it. The two pots are covered and sealed with mud over the entire outside, until the mud is three inches thick, to insure freedom from leakage. After drying in the shade for a month, the sealed vessels are heated with horse manure for three days and nights. After cooling, the vessels are opened, and the copper is pounded out which will flow like molten copper and iron. The copper is then cast into hollow cylinders, into which *Tau Sha Shui* (10018, 9020, 10128) (Medicine Sand Water) is put. After heating with horse manure for thirty day, gold is obtained. The gold is cast into hollow cylinders into which *Tau Sha* is put. After heating with horse manure for thirty days, the contents are taken out. Upon powdering a mixture of two parts of this with one of raw *Tau Sha* (Red Sand, Medicine Sand, Cinnabar)—mercury is quicksilver—coagulation immediately occurs into gold which is lustrous and beautifully colored and is fit for making nails.

40. Method of Making *Tau Sha Shui*. To a pound of *Tau Sha* in a raw bamboo pipe, two ounces of *Shih Tan* and two of *Hsiao Shih* (4297, 9964) (niter?) are added. The ends are then covered and sealed with *Ku H'au* (6234, 12490) (Bone Pills). When the sealings have become dry, the sealed pipe is placed in good bitter wine and buried three feet below the surface of the earth. In thirty days time a red water of bitter taste is obtained.

41. According to the *Tso Huang Chin Fa* (11741, 5124, 2032, 3366) (Method of Gold Making) received by *Chin Lo Hsien Sheng* (2032, 7343, 4440, 9865) from *Ch'ing-lin-tz'u* (2184, 7157, 12317), tin sheets, each measuring six inches square by one and two-tenths inches thick, are covered with a one-tenth inch layer of a mud-like mixture

of *Ch'ih Yen* (Red Salt) and *Hui Ch'ih* (5155, 1789) (potash-water, lime-water), ten pounds of tin to every four of *Ch'ih Yen*. They are then placed in a red-earthen pot and properly sealed. After heating for thirty days with horse manure, all the tin becomes ash-like and interspersed with bean-like pieces which are the yellow gold. The gold may also be obtained by ten refinings by the action of burning charcoal. Twenty ounces of gold are obtained from every twenty pounds of tin used. Only the earthen pots of *Ch'ang Sha* (450, 9624), *Kuei Yang* (6435, 12883), *Yu Chang* (13678, 300), and *Nau Hoi* (8128, 3767) are effective for the compounding. Such pots are abundant in those places since they are made there for use in cooking.

42. Method of Making *Ch'ih Yen* (Red Salt). One pound each of *Han Shui Shih* (3825, 10128, 9964) (Cold Water Stone), *Han Yu Li* (3825, 13617, 6879), and *Pai Fau* (White Alum) are prepared. These, together with one pound of *Hau Yen* (3825, 13112) (Cold Salt), are heated in an iron vessel by means of charcoal, when reduction to a red color occurs. The material is ready to use.

43. The Method of Gold Making as taught to *Lu Li Hsien Shêng* (—, 6870, 4440, 9865) by *Chi-ch'iu-tzû* is as follows: Two measures of *Fau Shih Shui* (Alum Water) are placed in an iron vessel and heated to boiling with charcoal. Some mercury is then added and stirred thoroughly until it has undergone six or seven boilings. Upon pouring the material on the ground, silver is obtained.

44. One measure of *Tau Sha Shui*, one of *Tsêng Ch'ing Shui* (11735, 2184, 10128), and two of *Hsiung Huang Shui* (Male Yellow Water, arsenic sulfide water?) are gently heated to boiling in a *Li* (—) vessel. After thorough stirring and further heating to boiling, some of the silver obtained above is added. Heating is continued until the mixture has undergone six or seven boilings. Upon pouring on the ground, the substance *Shang Sê Tzû Mo Chia* (9729, 9602, 12329, 7974, 2032) (Best Color Purple Mill Gold) is obtained.

45. Method of Making *Hsiung Huang Shui*. A mixture of one pound of *Hsiung Huang* and two ounces of *Hsiao Shih* is placed in a bamboo pipe. The ends are covered, sealed with *Ch'i Ku Wan* (1023, 6234, 12490) (Lacquer Bone Pills), and placed in good strong vinegar (or in good bitter wine according to some versions). After burial, two feet below the surface of the earth, for thirty days, *Hsiung Huang Shui* is obtained.

46. *Tsêng Ch'ing Shui* and *Fau Shih Shui* are made in the same manner, the only difference being in the contents of the bamboo pipe.

47. **The Children's Method of Making Gold.** A large iron cylinder, one foot and two inches both in diameter and in height, and a small iron cylinder, six inches in diameter, are used. One pound of good powdered *Ch'ih Shih Chih* (talc?), one of *Hsiao Shih* (niter?), one of *Yü Ma* (13812, 8007) (Mica?), one-half of *Liu Huang* (Sulfur), four ounces of *K'ung Ch'ing* (6595, 2184) (a blue copper compound?), and one of *Ning Shui Shih* (8339, 10128, 9064) (a mica like mineral) are intimately ground together and passed through fine-meshed sieves. The paste obtained by mixing with vinegar is used to make a lining two-tenths of an inch thick on the inside of the small cylinder.

48. A mixture of one pound of mercury, one-half of *Tau Sha*, and one-half of *Liang Fei* (7017, 3459) is stirred thoroughly until the mercury has disappeared. It is then placed in the small cylinder, overlaid with *Yü Ma*, and covered with an iron lid. The *Liang Fei* is obtained as follows: To ten pounds of *Ch'ien* (lead) heated in an open iron pot over a furnace three ounces of mercury are added. The portion which comes out during the early stages of the operation is scooped off with an iron ladle and is called *Liang Fei*.

49. Molten lead is introduced into the large iron cylinder on a stove. The small cylinder with its contents is then placed in the large cylinder, its top one half-inch below that of the large one. Heat is applied to keep the lead molten. Strong heating is continued for three days and nights, when *Tzū Fên* (12329, 3519) (Purple Powder) will be obtained.

50. Silver is obtained by heating together mercury and *Tzū Fên* until they have attained very close relations and then pouring the material into water.

51. **Method of *Hsü-Ch'ing-tzū*.** In this method an iron vessel nine inches long and five inches in diameter is used. Its insides are lined with a paste made of a mixture of three pounds of ground *Hsiung Huang* and an equal quantity of the soil of earthworms and ants until the inside diameter of the vessel becomes three inches and the indented opening four inches. Two measures of *Tau Sha Shui* are added. The vessel with its contents is then placed over a fire of horse manure until exceedingly dry.

52. The dried material is next placed in a copper vessel, tightly covered with a copper lid built over with yellow sand and earthworm-soil to prevent leakage, and this is placed in a furnace containing a three-inch layer of charcoal until its mouth becomes reddened. Upon cooling all of the *Hsiung Huang* is found to have adhered to the copper vessel. This process is repeated with the remaining dry material

until it is exhausted. It will then be found that three pounds of the spirit of *Hsiung Huang* has separated and adhered to the vessel.

53. The substance thus obtained may be mixed with an equal quantity of yellow sand to be made into furnaces of various sizes for use in gold making. One of these furnaces is heated to redness in a charcoal fire. Mercury is added. When the mercury begins to stir, lead is poured in. Yellowness is then observed to start and spread from all sides toward the middle. Upon pouring on the ground, gold is obtained. The usefulness of the furnaces will be exhausted after they have served for the making of one thousand and five hundred pounds of medicine.

54. Upon treatment with *Ma Ching* (8089, 2157) wood and *Ch'ih Hsi Chiu* (1967, 10070, 2260) (a kind of alcoholic liquor) for a hundred days, the gold softens and becomes kneadable. The eating of one pound of this medicine in pills of the size of small beans, one pill at a time, three times a day, will kill off all the three worms and drive away all the hundred diseases. If the eater be a blind man, he will see; if a deaf man, he will hear; and if an old person, he will be rejuvenated to the state of thirty years of age. The eater will not be scorched by fire and will be invulnerable to all evils, poisons, bleak winds, and excessive heat and dampness.

55. The ingestion of three pounds will enable a person to walk on the surface of water. The hundred spirits of the mountains and waters will come to wait on him. He will live as long as heaven and earth.

56. By rubbing the eyes with a pill boiled in *Chu Hsueh* (2611, 4847) (Blood-like Sap of the *Chu* Plant) and *Chu Ts'oo* (Red Plant), one will be able to see ghosts and things under the ground and to write in the dark.

57. When a pill that is painted with the blood of a white goat is thrown into water, fishes and dragons will come forth to be caught.

58. A pill painted with the blood of a black goat, when hung over the gateway of a village, will protect the entire village from epidemics. If it is smeared on the foreheads of cattle, sheep, or any of the six domestic animals, they will be protected against diseases and against tigers and leopards.

59. When a pill painted with tiger's spleen and snake's fat is dropped into an enemy's camp at the beginning of a month, the hostile forces will be thrown into confusion, fighting among themselves.

60. A pill is painted with an ox's blood. Throw it into a well, and the water will boil. Throw it into a flowing stream, and the water will reverse its course for a distance of a hundred steps.

61. When a pill that has been painted with a white dog's blood is put in a dark place in a community temple, the ghosts of the temple will come forth ready to serve.

62. Let a pill be painted with hare's blood. Put it in a dark place and fairies numbering sixty or seventy will be at one's service.

63. On putting a pill painted with *Li Yü Tsa* (6883, 13510, (10629) (the carp's gall) into water, the water will go asunder making a gap of ten feet for breathing space. The carrying of such a pill will prevent one's clothes from being wetted in the rain.

64. By swallowing a pill that has been boiled with *Tz'ü Hsien* (12329, 4541) one will be free from hunger for a hundred days.

65. By carrying in one's hair a pill that has been boiled with *Tz'ü Shih* (12406, 9964) one will be invulnerable in fighting against outlaws. All missiles directed at him will be reversed.

66. Compound *Liu Ting* (7276, 11253), *Liu Jen* (7276, 5610), and *Shang T'u* (9729, 12099) into a pill. When it is placed between the nose and the upper lip one's person will vanish from view. Spit a pill at a fire in a northerly direction and the fire will die out. Throw a pill at a tree in a westerly direction at the *Sshü Yu* (9816, 13398) hours on *K'eng Hsü* days and the tree will wither on the very day. With cautious steps one may come up to tigers, wolves, snakes, and venomous snakes to kill them immediately by throwing a pill at each.

67. Inks prepared from such pills will penetrate stone, gold, and wood. The indentations will be too deep to be erased.

68. A person who has been dead for not more than a day may be revived by washing a pill down his throat and spraying his face with water of *Yüeh Chien Shung* (13768, 1592, 9729).

69. By putting in his fingernail a pill that has been painted with wolf's and crane's blood, one can bring about changes in things by pointing his fingers at them and at the same time uttering verbal orders. The movement of mountains and trees may be apparent to everybody when as a matter of fact no motion occurs.

70. As in the case of the making of the nine medicines, services of worship should be properly performed to *T'ai I* (Supreme Monad), *Hsüan Nü*, and *Lao-tz'ü* in the making of the Yellow and the White. There should be constant burning of the five incenses. When gold is successfully compounded, three pounds of it should first be thrown into deep water and ten pounds of it in a marketplace before any of it is used for other purposes.

## ABSTRACT AND TABLE OF CONTENTS

## CHAPTER IV. ON THE GOLD MEDICINE

1. Thousands of books agree that *Huan Tan* (Returned Medicine) and *Chia I* (Gold Fluid) are the means of becoming *Haicu*.
- 2, 3. The general ignorance of the art.
4. The pretentiousness of the ignorant.
5. How *Pao-p'u-tzū* received knowledge of the art—from *Ch'ing Chūn* who received it from *Pao-p'u-tzū's* great uncle, *Hsien Kung*, who received it from *Tao Yüan-Fang* who received it from a spiritual being.
6. *Chia Tan* (Gold Medicine) compared with medicines of less efficacy. Gold Fluid and Returned Medicine recommended by *Jao-tzū*.
7. The effect of the two medicines, a result of deriving strength from an external substance.
8. For the few who believe in the *Tao*, practical directions for the practice of the art are given.
9. The improved state of mind which comes from learning the art.
10. The futility of working with poor materials.
11. More depends upon the degree of working than upon the particular recipe.
12. Even a minor medicine is far superior to vegetable substances. Vegetable substances, unlike *Tan Shu*, turn to ashes when they are burned.
13. Many do not even know that mercury comes out of *Tan Shu*.
14. The *Ch'ên Jen* of antiquity transmitted a sure method of attaining immortality.
15. *Pao-p'u-tzū* has always attached a high value to the truth and to unusual information.
16. The present writing is for the truly appreciative ones of later times.
17. People of the world fritter away their time and energy.
18. Wealthy people also are superficial.
19. The prize is worth the trial.
20. Popular judgement of the *Tao* cannot be trusted.
21. *Huang Ti* gained immortality by means of the medicine. Vegetable medicines and deep breathing confer long life, but *Shü's Tan* confers immortality.
22. *Huang Ti* transmitted the book to *Hsüan-tzū*, giving him advice on the pursuit of the *Tao*.

23. Conditions which ought to be observed in preparing the medicine. Vegetable materials are not suitable.
24. The nine preparations are unknown to unfortunate millions.
25. Certain ceremonies of worship are also requisite.
26. The first medicine, *Tan Hua*. Directions for its preparation. It confers immortality in seven days and converts quicksilver into gold.
27. The second medicine, *Shên Tan* or *Shên Fu*, confers immortality in a hundred days and has other magical powers.
28. The third medicine, *Shên Tan*, confers immortality in a hundred days and has other magical powers.
29. The fourth medicine, *Huan Tan*, confers immortality in a hundred days, converts quicksilver to gold, and has other magical powers.
30. The fifth medicine, *Êrh Tan*, confers immortality in thirty days and has other magical powers.
31. The sixth medicine, *Lien Tan*, confers immortality in ten days and converts quicksilver into gold.
32. The seventh medicine, *Jau Tan*, confers immortality in a hundred days, restores the reproductive faculty, and converts lead (?) into gold.
33. The eighth medicine, *Fu Tan*, confers immortality on the day that it is eaten, and wards off evil.
34. The ninth medicine, *Hau Tan*, confers immortality in a hundred days and has other magical powers.
35. Any one of the nine medicines is sufficient to make the eater a *Hsien*.
36. There is also the *T'ai Ch'ing Shên Tan* which originated with *Yüan Chün*, teacher of *Lao-tzŭ*. The last three chapters of the *T'ai Ch'ing Kuan T'ien Ching* treat of the medicine.
37. Even *Yüan Chün* acquired his great powers by following the *Tao* and by eating the medicine.
38. Warning against disclosing the secrets of the *Tao*.
39. When the medicine has been made, a sacrificial offering of a hundred catties should be made.
40. Directions for making the offering.
41. *Shên Tan* is alone necessary for immortality.
42. *Hsien Yeh Yü Chün* succeeded in making the *T'ai Ch'ing Tan* and became an immortal by means of it.
43. The *T'ai Ch'ing Tan* is more difficult to prepare than the Nine Furnace-pot Medicine. Its special powers, and the method of its preparation.
44. The more "turns," the more powerful the medicine. The

word which is here translated "turns" evidently signifies some repeatable process, like sublimation or distillation, by which the medicine is rendered purer and more potent.

45. The medicine of the ninth turn, sublimed with *Chu Êrk* by the heat of the sun, yields a Returned Medicine which will raise the user to the skies in broad daylight.

46. The efficacy depends upon the number of the turns.

47. *Chiu Kuang Tan*. Method of preparation. Five turns of five different colors.

48. *Ch'ing Tan*, the Blue Medicine, raises the dead.

49. Magical power of the Black Medicine.

50. Magical Power of the Yellow Medicine.

51. The materials needful for the preparation of the medicine by the method of the *Wu Ling Tan Ching* are enumerated. The medicine has the power to bring about immortality but is not as efficacious as those made according to the already described Supreme Clear Method and Nine Furnace-pot Method.

52. The *Min Shan* method of *Chang Kai Ta* described. The medicine restores sight, hair, teeth, etc., and by repeated eating confers immortality.

53. *Wu-ch'ing-tzã's* medicine; its preparation.

54. *Hsien-wên-tzã's* medicine; its preparation and magical effects. One attains the *Tao* by eating it regularly for three consecutive years.

55. The *Li Ch'ing Tan*; its preparation and effects; its use in conjunction with the Red Herb.

56. The *Ch'ü Fu Tan*, made from *Tau* fishes, imparts certain magical powers.

57. Preparation of the medicine according to *Ch'ih-sung-tzã*. It imparts redness to the features and hair, and confers immortality.

58. Preparation of *Shih Hsien Shêng's* medicine; it contains animal ingredients and confers long life.

59. Preparation of the medicine of *K'ang-fêng-tzã*; it contains animal ingredients and confers long life.

60. *Ts'ü-wên-tzã's* medicine; its preparation described. It extends life and confers immortality.

61. The method of *Liu Yüan*. One tenth of a quart of the medicine enables one to live a thousand years, habitual drinking of it brings immortality.

62. Description of *Lo-ch'ang-tzã's* procedure. The medicine makes a *Hsien* in three years.

63. *Li Wen's* preparation described; it makes a *Hsien* in a year.
64. *Yiu-tzu's* preparation described; it confers long life.
65. Preparation of the *Tai I Chao P'o Tan*; it revives the dead.
66. *Ts'ai Nü Tan*, made from *Tan* and animal products, gives the user the services of two fairies.
67. *Chi-eh'iu-tzu's* preparation described; it confers long life.
68. *Mo-tzu's* preparation described; it confers immortality.
69. Method of preparing *Chang Tzû Ho Tan*, a medicine which brings long life.
70. Preparation of the elixir of *Ch'i Li*.
71. *Ch'i Li* medicine converts lead into silver and *Hsiung Huang* into gold.
72. *Yü Kwei Tan*; its preparation and effects.
73. Preparation of *Chou Hou Tan*; it confers immortality and converts copper into gold.
74. Preparation of *Li Kung's* medicine; it will enable a man to last as long as the sky and the earth.
75. Preparation of *Liu Shêng's* medicine; it imparts long life and restores youth.
76. Preparation of *Wang Chün's* medicine; it prevents ageing and decay of the body.
77. Preparation of *Ch'ên Shêng's* medicine; it protects from hunger and confers long life.
78. Preparation of the medicine of *Han Chung Chung*; it prolongs life, improves the eyesight, etc.
79. *Chin I* (Gold Fluid) is as efficacious as the nine medicines. *Jao-tzu* transmitted the secret of it to *Yüan Chün*. The process, which occupies one hundred days, should be carried out in private. The effects of the medicine in making *Hsien*. Desirability of abstinence from cereals.
80. A medicine prepared from Gold Fluid and quicksilver makes a *Hsien* out of any person. It converts mercury into silver, and has other marvelous properties. By eating and drinking out of vessels made of this medicine, one will attain immortality. Gold Fluid converts yellow earth into serviceable yellow gold.
81. This gold, again heated, yields a medicine which will make one an earthly immortal and will convert mercury into silver, and this silver will further convert lead into silver. Method of procuring the classic on the Gold Fluid. The classic must not be given indiscreetly.
82. The nine medicines are best but the materials are not easy to

procure and the process is difficult. The compounding of the Gold Fluid is much easier. A total expenditure of 400,000 cash will make a quantity of it large enough to transform eight persons into *Haicu*. Large amounts of material are necessary for successful operation.

83. There is also the *Êrh Huang Chin* (Food of Yellow Gold) which is not as good as Yellow Gold but is far better than other medicines. Several methods of refining gold.

84. An inferior medicine, which brings immortality only through frequent ingestion, may be made from silver and large pearls of the oyster.

85. Not only money but isolation in a celebrated mountain is necessary for success in compounding the Gold Fluid and the nine medicines. The secret must not be printed in books on the *Tao*.

86. The compounder of the medicine must guard against ridicule, must make offerings to the gods, must work in a secluded place in a famous mountain, and should diet, refraining from stimulant food and raw fish, from one hundred days before beginning the work until the medicine is done.

87. The seeker should not work in a small mountain, but in a famous one, and should guard against devils, chickens, dogs, children, and women.

88. A list of twenty-seven mountains recommended by the Book of the Immortals.

89. A list of six large islands which are next in order as places good for the preparation of the medicine.

90. Eight accessible mountains in the central part of the country.

91. *Pao-p'u-tzû* explains his position in seeking the *Tao* and in writing about it.

92. Formula of the Lesser Divine Medicine which brings rejuvenation and immortality.

93. Method of the Lesser Medicine which will cure the hundred sicknesses and dispel the three demons, confer immortality and impart magical properties.

94. Method of the Lesser Food of Yellow Gold. The medicine, made from gold (or silver) and wine confers magical powers and makes a man an immortal of the earth.

95. Method of the Food of Reduced Yellow Gold of *Liung-i-tzû*. The medicine, made from hog's skin and fat, bitter wine, and gold, confers longevity and immortality. The secret should not be divulged, else the medicine cannot be prepared successfully.

## ABSTRACT AND TABLE OF CONTENTS

## CHAPTER XVI. ON THE YELLOW AND THE WHITE.

1. The writings on the art of transmutation. They are difficult to understand and are not believed by the common people.
2. *Pao-p'ü-tzū* received three books from *Chêng Chün*.
3. *Chêng Chün* claimed that he had accomplished a successful transmutation with *Tao Chün*. The same diligence and hardships are necessary as in the compounding of the Gold Medicine.
4. The author explains his position in writing on these matters. In the Inner Chapters there are no rhetorical flourishes but mere plain outspoken words. He is sure of good results and of the truthfulness of his teachers.
5. Although he has not made gold and silver himself, he writes simply for the sake of interesting truth-loving scholars of the future in the study of the *Tao*.
6. Strange things can be accomplished, but there are many who cannot accomplish them.
7. Several strange things. Lead, which is white, can be reddened into *Tau*, and *Tau*, which is red, can be whitened into lead, etc.
8. Transformations are common in nature—why not into gold and silver? But they are difficult to understand unless matters are traced to their beginnings and ends.
9. Narrow-minded and ignorant people are incredulous.
10. The fact that *Liu Hsiang* did not attain the *Tao* does not prove that it is unattainable.
11. *W'ü Yu W'ü* reported that *Lü K'ou* converted a mixture of lead and tin into silver but was unable himself to repeat the process with success because he could not fulfil the conditions.
12. The wife of *Ch'eng W'ei* by an incantation summoned forth two measures of silk.
13. A story from the *Chên Chung Hung Pao* (The Great Treasure in the Pillow-Chest) of *Huai-nan-tzū* (a work which is not now known to exist). The wife of *W'ei* converted mercury into silver, but suffered severe punishment and finally death rather than reveal the secret to her husband whom she considered unworthy.
14. *Hua Ling Sū* in recent times witnessed the conversion of lead into silver and of the silver into gold. From a *Tao-shih* he learned the art of penetrating-sight.
15. The conditions for compounding the Yellow and the White are similar to those for compounding the *Shên Tau*. *Liu Hsiang* was unable to accomplish it in a palace.

16. *Shih Hsia Chien* was of course unable to carry out the operation successfully in a palace surrounded by attendants and slaves.

17. The seeker must be more fastidious than ordinary dyers who avoid the sight of people lest their dyeings be spoiled.

18. The seeker must get at the essentials.

19. Report of the author's conversation with *Chêng Chün*. The *Chên Jen* make gold for the purpose of becoming *Hsien* by eating it. Silver may be eaten for the same purpose but is not as good as gold.

20. The author asks him why natural gold and silver may not be eaten for the same purpose, and suggests that the gold and silver which are made may be make-believes.

21. *Chêng Chün* replies that ordinary gold and silver are suitable but *Tao-shih* are poor and have no choice except to make the metals for themselves.

22. The superiority of the gold and silver which are made.

23. Theory of the formation of gold from *Tau*.

24. The gold obtained by successful compounding is uniform throughout; it may be worked without change and may be made into nails. Why should it be called make-believe?

25. Examples of make-believe: reddening of iron by means of a copper salt, tarnishing of silver by means of egg-white to give it the appearance of gold—merely external changes.

26. Like the making of gold is the cultivation of the fungus, *Chih*, etc. The cultivated plant is exactly like that found in nature.

27. A quotation from the Book of Immortals. Three classes of *Hsien*, the highest is attained by eating gold made from *Chu Sha* (Red Sand). The making of gold and silver and the attaining of immortality are natural processes.

28. A quotation from the Jade Tablet Records in confirmation of these opinions.

29. Quotation from the Copper Pillar Book. Materials for making gold and silver, the authenticity of the products.

30. Quotation from *Huang-shau-tzū*.

31. Quotation from the Tortoise Shell Inscriptions.

32. The unanimity of the ancients indicates their truthfulness.

33. The present prices of reagents are deplorably high.

34. Rich people are unwilling to risk their wealth on the process and to undergo the hardships which are necessary.

35. It is unwise to make attempts without learning the methods first from famous teachers. Ordinary medical recipes are difficult because of the secret names. Examples. The art of the Yellow and the White is much more difficult for the same reason.

36. Immortality is the highest achievement of the *Tao*.
37. Common medicines are designated in the formula-books by unfamiliar names. Examples.
38. Further examples, names which are easily misunderstood or readily misinterpreted. *Liu Hsiang* failed because he did not know how to decipher the code of names.
39. Description of apparatus and process for procuring copper, for converting this into gold, and for converting *Tau Sha* into gold.
40. Method of making *Tau Sha Shui*.
41. Method, derived from *Ch'ing-liu-tz'u*, of converting tin into gold, a method which possibly yields stannic sulfide or "mosaic gold." Process described in considerable detail.
42. Method of making *Ch'ih Yen*.
43. *Chi-ch'iu-tz'u*'s method of preparing silver from mercury.
44. Preparation of Best Color Purple Mill Gold from this silver.
45. Method of making *Hsiung Huang Shui*.
46. Method of making *T'ung Ch'ing Shui* and *Fau Shih Shui*.
- 47-50. The Children's Method of making gold. Apparatus described. *Liang Fei*, prepared from lead and mercury, is converted into *Tz'u Fen* (Purple Powder) by heating with mercury and *Tau Sha*, and this with more mercury yields silver.
- 51-53. Method of *H'ui-ch'ang-tz'u*. Apparatus described. Gold from mercury and lead by the action of the spirit of *Hsiung Huang*. The furnaces are exhausted after having served for the making of 1500 pounds of medicine.
54. Kneadable gold. The effect of the pills after one pound has been taken.
55. Effect of the ingestion of three pounds.
- 56-65. Magical effects of various preparations of the pill.
66. Preparation of another pill which confers invisibility and has other magical powers.
67. Indelible ink.
68. Reviving the dead.
69. Magical control over natural objects, which control however is only apparent.
70. In making the Yellow and the White, services of worship are necessary (*c. f.* IV, 86). The five incenses should be burned constantly. When the gold is successfully compounded, three pounds of it should first be thrown into deep water (*c. f.* IV, 22) and ten pounds of it in a marketplace (*c. f.* IV, 40) before any of it is used for other purposes.

## INDEX OF CHINESE WORDS

(Roman Numerals refer to chapters, Arabic numerals to paragraphs.)

# On the Philosophers' Stone

From A.E. Waite's *Collectanea Chemica*, London, 1893.

---

## **CHAPTER I. The Introduction.**

Because many have written of the Philosopher's Stone without any knowledge of the art; and the few books extant, written by our learned predecessors and true masters hereupon, are either lost or concealed in the collections of such (however despised) as are lovers and seekers of natural secrets, we have taken a resolution to communicate our knowledge in this matter, to the intent that those who are convinced the Philosophical Work is no fiction, but grounded in the possibility of Nature, may be faithfully directed in their studies, and have an undoubted criterion to distinguish between such authors as are genuine sons of science and those who are spurious, as writing by hearsay only.

We shall not on this occasion give a summary of their names who are undoubted masters in the art, but shall take occasion to introduce them, as it may be necessary, in the following chapters; and as their sense is often concealed under a studied ambiguity of expression, we shall, out of the gift which the Almighty hath dispensed to us, declare plainly, and without any reserve, the first matter of the Philosopher's Stone, the manner of proceeding through the whole process, both in the Vegetable and Metallic Tinctures, beginning with the Vegetable process first, as the most easy and simple, yet well worthy the attention of all ingenious persons, particularly the practical chemists and preparers of medicines.

## CHAPTER II.

### Of the Vegetable Tincture, or the Process called the Lesser Circulation.

Very few of the true philosophers have touched upon this subject, for it seemed trifling in respect to the great work, as the process in metals is generally termed; but there is a modern publication in English, a small thin duodecimo, without any author's name, having for its title: *Aphorismi, seu Circulus majus et Circulus minus*, wherein the whole process is plainly laid down.

This book is written by an undoubted master in the art; and no treatise, ancient or modern, is so explicit in the directions for conducting the great work. The directions are very short, but much to the purpose, provided the reader has an idea what part of the work is alluded to. The author, agreeable to his title, delivers his doctrine by way of aphorisms. But to return from this digression.

We proposed in this chapter to lay open the vegetable process, as a clue to the more important work in the mineral kingdom. A certain person, who is now living, and advertises balsam of honey, tincture of sage, etc, has turned his studies this way; and from his great abilities as a professed physician and botanist, has convinced all unprejudiced persons that noble tinctures may be extracted from vegetables. We hope this gentleman will not despise our free communication, both to him and the public, if we show the insufficiency of his method, though it is ingenious, while we establish the rationale of ours on the never-failing ground of truth and philosophy.

He observes, with a precision which can only result from numerous trials, that different herbs impart their tinctures in such proportions of alcohol as he has found out. It is allowed that the volatile spirit and balsamic sulphur are thus extracted; but there are the essential, or fixed, salt and sulphur of the herb yet left in the process. These require another management to extract, which he is either ignorant of, or is so disingenuous as to conceal from the public; but that so noble a secret may lie open to all for a general advantage, here follows a plain account of the vegetable work.

Take any herb which is potent in medicine, and either extract the tincture with spirit of wine, or distil in the common way; reserve the distilled water, or tincture, when separated from the feces, for use. Then take the feces, or *Caput Mortuum*, and calcine it to a calx. Grind this to powder.

That done, take the water, or tincture, and mix them together; distil again, and calcine, forcing the moisture over by a retort, in a wary process, calcining and cohobating the spirit on the salt till it attains a perfect whiteness and oily nature, like the finest alkali, commonly called Flemish.

As your salt requires it in the process, have in readiness more of the extracted tincture, or distilled spirit, that you may not work it, viz., the salt, too dry; and yet proceed cautiously, not adding too much of the moisture, so that the dealbating, or whitening, may keep visibly heightening at every repetition of the process. Frequent experiments may enable you to push it on to a redness, but a fine yellow is the best of all; for the process tends, in its perfection at this period, to a state of dryness, and must be

managed with a strong fire. By following these directions, you have here the two tinctures in the Vegetable Kingdom, answering to the white and red tinctures in the mineral.

### CHAPTER III.

#### **Of the Uses of the Vegetable Tinctures, with some general remarks on their great efficacy in medicine.**

You have, by carefully following our directions above, procured the tinctures, white or yellow, in the Vegetable Kingdom. The yellow is more efficacious if the work is well performed; either of them, by being exposed in the air, will soon run into a thick, essential oil, smelling very strong of the plant, and the virtues of any quantity may be concentrated by often repeating the circulation. But you have no need of this, unless for curiosity, there being in your tinctures a real permanent power to extract the essential virtues of any herb you may require on immersion only, where the essential salt and volatile spirit, together with the sulphureous oil, are all conjoined, floating on the top of your tincture, and the terrestrial feces precipitated to the bottom; not as in distillation, or extraction of the tincture with alcohol, while the stalk and texture of the plant are entire; no, this Vegetable Tincture devours the whole substance of the plant, and precipitates only the earthy particles acquired in its vegetation, which no degree of calcination could push to an alkali, without its essential salt.

Such is the virtue of our Vegetable Tincture; and if the operation be never so often repeated with different herbs, it loses nothing of its virtue, or quantity or quality, casting up the virtues of whatever herb is immersed, and precipitating the earth as before when both are easily separated and the medicine preserved for use.

Let a medicine, thus prepared, be examined, and the principles by which it is extracted, with the general methods of preparation; if the distilled water for instance, of any aromatical or balsamic herb, be took, common experience will convince us that nothing but its volatile parts come over the head; but take the Caput Mortuum, and it will calcine after this process, and afford an alkali, which proves itself to be an essential salt by its pungency, and will, in the air, run to an oil, which is its essential sulphur. If you take the tincture extracted with alcohol, it is the same, only the more resinous parts of some herbs may enrich the extract, and the volatile sulphur giving the color and scent, be retained, which escapes in distillation; but the potent virtue or soul of the herb, if we may be allowed the expression, goes to the dunghill. It is the same if the expressed juice of the herb is used; and if taken in powder, or substance, as it is sometimes prescribed, but little of its virtue, beyond its nourishing quality, can be communicated to the patient, except as a bitter or a vermifuge, in which cases, perhaps, it is best by way of infusion.

Let none despise the operation above laid down, because it is not to be found in the ordinary books of chemistry; but consider the possibility of Nature, who brings about wonderful effects by the most simple causes: neither let any imagine this process so easy as to perform it without some trials, patiently attending to her operations and endeavoring to account for any deficiency in the course of his work. For this reason it will be proper that the artist forms to himself an idea what the intention is to procure, how far Nature has prepared his matter to work upon, in what state she has left it, and how far it may be exalted above the ordinary point of virtue, which it could attain in the crude air, and this by the Philosophic Art assisting Nature, as a handmaid, with an administration of due heat, which is nutritive and not corrosive.

A recapitulation of the foregoing process, with some remarks on the different stages, will be sufficient here to explain our meaning above, and prepare the reader for what follows concerning the metallic tincture, or Stone of the Philosophers.

The virtues of herbs and simples are confessedly great and manifold; among these, some are poisonous and narcotic, yet of great use in medicine; none of them but want some preparation or correction. Now the common ways of doing this are defective; neither preserving the virtue entire, nor furnishing any menstruum capable of doing it with expedition and certainty. Alcohol, as was before observed, will extract a tincture and distillation a spirit. We reject neither of these methods in our work, as they are useful to decompose the subject; but we are not content with a part of its virtues.

To speak philosophically, we would have its soul, which is in its Essential Salt, and its spirit, which is in the Inflammable Sulphur. The body in which these resided we are not concerned for; it is mere earth, and must return from whence it came: whereas the soul and spirit are paradisiacal, if the artist can free them from their earthy prison without loss; but this can only be done by death. Understand us aright.

Philosophically speaking, no more is meant than decomposition of the subject into its first principles, as the uniting them more permanently with an increase of virtue is most emphatically called a resurrection and regeneration. Now this decomposing is to be done with judgment, so as not to corrode or destroy, but divide the matter into its integral parts. At this period of the work the artist will consider what is further intended, keeping Nature in view, who, if she is properly assisted in her operations, produces from the dissolution of any subject something more excellent, as in a grain of corn, or any vegetable seed, which by cultivation may be pushed to a surprising produce; but then it must die first, as our Blessed Saviour very emphatically observes: and let this saying dwell upon the artist's imagination, that he may know what he generally intends; for the whole philosophical work, both in vegetables and minerals, is only a mortifying of the subject, and reviving it again to a more excellent life.

Now if the intention in the foregoing process was to increase simply any vegetable in its kind, the destruction and revivification must follow the ordinary course of vegetation by the medium of seed; and Nature can only be assisted by fertilizing the soil, together with a proper distribution of heat and moisture. Yet there are not wanting authors, and particularly Paracelsus, who boldly describe processes wherein the vital quality of the seed has been destroyed by calcination, and yet brought to life again at the pleasure of an artist. Such reveries are a scandal to philosophy, and a snare to the superficial reader, who is generally more struck with impossibilities, roundly asserted, than the modesty of true artists. These confess their operations are within the bounds of Nature, whose limits they cannot surpass.

The reader, then, will consider that our intention here is not to increase the seminal quality, but to concenter, in a little compass, the medicinal virtues of a herb. Nature is desirous of this in all her productions, but can only rise to such a point of perfection, in her ordinary course, through the crudity of the air and fixing power of the elements. Now if we take the vegetables at that point of perfection to which she has pushed them, and farther assist her in decomposing, purifying, uniting, and reviving the subject, we obtain, what she could not otherwise produce, a real permanent tincture, the quintessence, as it is called, or such a harmonious mixture of the four elementary

qualities as constitutes a fifth, from thenceforth indissoluble, and not to be debased with any impurity.

But the virtue of this Vegetable Tincture is capable of improvement ad infinitum, in its own kind, by adding more of its spirit or extracted tincture, and repeating the circulation, which is every time more speedily finished, as there is a magnetical quality in the fixed salt, and essential oil, which assimilates to itself all the real virtues of what is added, only rejecting the feculent, earthy qualities; so that in a grain of the tincture much virtue may be concentrated, not at all corrosive or ardent, but friendly to the animal life, and most powerful as a medicine for disorders which the herb is appropriated to cure. Nay, something of this nature was still sought for by the distillers of ardent spirits, when phlegm has been drawn away from the volatile sulphur, till it becomes proof spirit, as it is termed, which will burn dry, a plain indication that it contained nothing essential in it from the subject out of which it was extracted: for that which is essential cannot be destroyed by the fire, but is reddened to an alkaline salt, having in its center an Incombustible Sulphur, which, on exposing to the air, manifests itself both to the sight and touch. Now, if this Salt and Sulphur are purified, and the distilled spirit, or extracted tincture, added, Nature finds a subject wherein she can carry her operations to the highest limit, if an artist furnishes her with proper vessels, and a degree of heat suitable to her intentions.

## **CHAPTER IV. Of the Metallic Tincture.**

When we undertook a description of the vegetable process, it was chiefly with a view to familiarize the reader to a general idea of the Philosophic Work in metals, as both proceed upon the same principles, only the mercuries of metals are more difficult to extract, and stronger degrees of heat are required, as well as more of the artist's time and patience; neither can he succeed in the operation without frequent trials, and a constant consideration within his mind as to what is within the possibility of Nature.

For this purpose it is necessary to know the composition of metals, that he may know how to decompose and reduce them to their first principles, which is treated of very mysteriously by the philosophers, and purposely concealed, as the right key to unlock all the secrets of Nature. We shall be more explicit on this head, for the time draws near when, as Sendivogius has observed, the confection of the Stone will be discovered as plainly as the making of cheese from rennet. But we warn the reader not to imitate Midas in the fable, by seeking the noble tincture in metals out of covetousness; for the true wise men seek only a medicine for human infirmities, and esteem gold but as it furnishes them with the means of independence and the exercise of universal beneficence. They communicate their talents, without vain glory or ostentation, to such as are worthy searchers of Nature, but concealing their names as much as possible, while living, as well as their knowledge of the mystery from the world.

We shall herein follow their example, and yet write more plainly of the Metallic Process than any of them has hitherto done, knowing that the providence of the Most High will effectually guard this Arcanum from falling into the hands of covetous gold seekers and knavish pretenders to the Art of Transmutation; because the first sort of men will, from their impatience, soon leave the simplicity of Nature for processes of more subtlety invented by the latter, and adapted to such avaricious views as the other have formed, who, judging of things by their own griping dispositions, know not the noble liberality of Nature, but imagine some gold must be advanced before she will replenish their heaps. This is well foreseen by those smoke sellers, who receive what they can catch, as if they were her proper agents; and, having no conscience to put a stop to their imposition, the deception is kept up till all vanishes in smoke.

Let it be observed, then, that all who have written on the art, from undoubted principles, assert that the genuine process is not expensive; time and fuel, with manual labour, being all allowed for. Besides, the matter to be wrought upon is easy to procure by the consent of all. A small quantity of gold and silver is, indeed, necessary when the stone is made, as a medium for its tinging either in the white or red tinctures, which such pretenders have urged from books of philosophers as a plausible pretence to rob the avaricious both of their time and money; but their pretences are so gross that none can be sufferers in this respect, if they have not justly deserved it.

The reader may then rest assured that this process is not expensive, and reject all authors or practitioners who advance anything contrary to this established verity, remembering the simplicity of Nature in her operations, observing her frugal method

in the production, and consummate wisdom in the dissolution of things; always endeavoring at something perfect in a new production. And because we are here proposing to help her in a metallic process, as before in the vegetable, let us consider a little how she forms the metals, in what state she has left them, and what need there is of the artist's skill to assist her in pushing them to that degree of perfection they are capable of attaining.

All true philosophers agree that the First Matter of metals is a moist vapor, raised by the action of the central fire in the bowels of the earth, which, circulating through its pores, meets with the crude air, and is coagulated by it into an unctuous water, adhering to the earth, which serves it for a receptacle, where it is joined to a sulphur more or less pure, and a salt more or less fixing, which it attracts from the air, and, receiving a certain degree of concoction from the central and solar heat, is formed into stones and rocks, minerals, and metals. These were all formed of the same moist vapor originally, but are thus varied from the different impregnations of the sperm, the quality of salt and sulphur with which it is fixed, and the purity of the earth which serves it for a matrix; for whatever portion of this moist vapor is taking along its impurities, is soon deprived of heat, both solar and central, and the grosser parts, forming a mucilaginous substance, furnish the matter of common rocks and stones. But when this moist vapor is sublimed, very slowly, through a fine earth, not partaking of a sulphureous unctuously, pebbles are formed; for the sperm of these beautiful, variegated stones, with marbles, alabasters, etc., separates this depurated vapor, both for their first formation and continual growth. Gems are in like manner formed of this moist vapor when it meets with pure salt water, with which it is fixed in a cold place. But if it is sublimed leisurely through places which are hot and pure, where the fatness of sulphur adheres to it, this vapor, which the philosophers call their Mercury, is joined to that fatness and becomes an unctuous matter, which coming afterwards to other places, cleansed by the afore-named vapors, where the earth is subtle, pure, and moist, fills the pores of it, and so gold is made.

But if the unctuous matter comes into places cold and impure, lead, or Saturn, is produced; if the earth be cold and pure, mixed with sulphur, the result is copper. Silver also is formed of this vapor, where it abounds in purity, but mixed with a lesser degree of sulphur and not sufficiently concocted. In tin, or Jupiter, as it is called, it abounds, but in less purity. In Mars, or iron, it is in a lesser proportion impure, and mixed with an adjust sulphur.

Hence it appears that the First Matter of metals is one thing, and not many, homogeneous, but altered by the diversity of places and sulphurs with which it is combined. The philosophers frequently describe this matter.

Sendivogius calls it heavenly water, not wetting the hands; not vulgar, but almost like rain water. When Hermes calls it a bird without wings, figuring thereby its vaporous nature, is it well described. When he calls the sun its father and the moon its mother, he signifies that it is produced by the action of heat upon moisture. When he says the wind carries it in its belly, he only means that the air is its receptacle. When he affirms that which is inferior is like that which is superior, he teaches that the same vapor on the surface of the earth furnishes the matter of rain and dew, wherewith all things are nourished in the vegetable and animal kingdoms. This now is what the philosophers call their Mercury and affirm it to be found in all things, as it is in fact. This makes

some suppose it to be in the human body, others in the dunghill, which has often bewildered such as are fond of philosophical subtleties, and fly from one thing to another, without any fixed theory about what they would seek, expecting to find in the Vegetable or Animal Kingdoms the utmost perfection of the Mineral. To this mistake of theirs, without doubt, the philosophers have contributed with an intention of hiding their First Matter from the unworthy; in which they were, perhaps, more cautious than is necessary, for Sendivogius declares that occasionally, in discourse, he had intimated the art plainly word by word to some who accounted themselves very accurate philosophers; but they conceived such subtle notions, far beyond the simplicity of Nature, that they could not, to any purpose, understand his meaning. Wherefore, he professes little fear of its being discovered but to those who have it according to the good pleasure and providence of the Most High.

This benevolent disposition has induced him to declare more openly the First Matter, and fix the artist in his search of it to the mineral kingdom; for, quoting Albertus Magnus, who wrote that, in his time, grains of gold were found betwixt the teeth of a dead man in his grave, he observes that Albertus could not account for this miracle, but judged it to be by reason of the mineral virtue in man, being confirmed by that saying of Morien: "And this matter, O King, is extracted from thee." But this is erroneous, for Morien understood those things philosophically, the mineral virtue residing in its own kingdom, distinct from the animal. It is true, indeed, in the animal kingdom mercury, or humidity, is as the matter, and sulphur, or marrow in the bones, as the virtue; but the animal is not mineral, and vice versa. If the virtue of the animal sulphur were not in man, the blood, or mercury, could not be coagulated into flesh and bones; so if there were not a vegetable sulphur in the vegetable kingdom, it could not coagulate water, or the vegetable mercury, into herbs, etc. The same is to be understood in the mineral kingdom.

These three kingdoms do not, indeed, differ in their virtue, nor the three sulphurs, as every sulphur has a power to coagulate its own mercury; and every mercury has a power of being coagulated by its own proper sulphur, and by no other which is a stranger to it.

Now the reason why gold was found betwixt the teeth of a dead man is this: because in his lifetime mercury had been administered to him, either by unction, turbid, or some other way; and it is the nature of this metal to ascend to the mouth, forming itself an outlet there, to be evacuated with the spittle. If, then, in the time of such treatment, the sick man died, the mercury, not finding an egress, remained in his mouth between his teeth, and the carcass becoming a natural matrix to ripen the mercury, it was shut up for a long time, till it was congealed into gold by its own proper sulphur, being purified by the corrosive phlegm of the man's body; but this would never have happened if mineral mercury had not been administered to him.

## CHAPTER V. Of the Second Matter, or Seed in Metals.

All philosophers affirm, with one consent, that metals have a seed by which they are increased, and that this seminal quality is the same in all of them; but it is perfectly ripened in gold only, where the bond of union is so fixed that it is most difficult to decompose the subject, and procure it for the Philosophical Work. But some, who were adepts in the art, have by painful processes taken gold for their male, and the mercury, which they knew how to extract from the less compacted metals, for a female: not as an easier process, but to find out the possibility of making the stone this way; and have succeeded, giving this method more openly to conceal the true confection, which is most easy and simple. We shall, therefore, set before the reader a landmark, to keep him from tripping on this difficulty, by considering what is the seed wherein the metals are increased, that the artist may be no longer at a loss where to seek for it, keeping in view the writings of our learned predecessors on this subject.

The seed of metals is what the Sons of Wisdom have called their mercury, to distinguish it from quicksilver, which it nearly resembles, being the radical moisture of metals. This, when judiciously extracted, without corrosives, or fluxing, contains in it a seminal quality whose perfect ripeness is only in gold; in the other metals it is crude, like fruits which are yet green, not being sufficiently digested by the heat of the sun and action of the elements. We observed that the radical moisture contains the seed, which is true: yet it is not the seed, but the sperm only, in which the vital principle floats, being invisible to the eye. But the mind perceives it, and in a true artist, as a central point of condensed air, wherein Nature, according to the will of God, has included the first principles of life in everything, as well animal and vegetable as mineral; for in animals the sperm may be seen, but not the included principle of impregnation: this is a centered point, to which the sperm serves only as a vehicle, till, by the action and ferment of the matrix, the point wherein Nature has included a vital principle expands itself, and then it is perceivable in the rudiments of an animal. So in any seculent fruit (as, for instance, in an apple), the pulp or sperm is much more in proportion than the seed included; and even that which appears to be seed is only a finer concoction of sperm, including the vital stamina; as also in a grain of wheat the flour is only the sperm, the point of vegetation is an included air, which is kept by its sperm from the extremes of cold and heat, till it finds a proper matrix, where the husk being softened with moisture, and warmed by the heat, the surrounding sperm putrefies, making the seed, or centered air, to expand and to burst the husk carrying along in its motion a milky substance, assimilated to itself from the putrefied sperm. This the condensing quality of the air includes in a film and hardens into a germ, all according to the purpose of Nature.

"If this whole process of Nature, most wonderful in her operations, was not constantly repeated before our eyes, the simple process of vegetation would be equally problematical with that of the philosophers; yet how can the metals increase, nay, how can anything be multiplied without seed? The true artists never pretend to multiply metals without it, and can it be denied that Nature still follows her first appointment? She always fructifies the seed when it is put into a proper matrix. Does not she obey an ingenious artist, who knows her operations, with her possibilities, and attempts

nothing beyond them? A husbandman meliorates his ground with compost, burns the weeds, and makes use of other operations. He steeps his seed in various preparations, only taking care not to destroy its vital principle; indeed, it never comes into his head to roast it, or to boil it, in which he shows more knowledge of Nature than some would-be philosophers do. Nature, like a liberal mother, rewards him with a more plentiful harvest, in proportion as he has meliorated her seed and furnished a more suitable matrix for its increase.

"The intelligent gardener goes farther; he knows how to shorten the process of vegetation, or retard it. He gathers roses, cuts salads, and pulls green peas in winter. Are the curious inclined to admire plants and fruit of other climates? He can produce them in his stoves to perfection. Nature follows his directions unconstrained, always willing to obtain her end, viz., the perfection of her offspring.

"Open your eyes here, yet studious searchers of Nature! Is she so liberal in her perishing productions, how much more in those which are permanent, and can subsist in the fire? Attend, then, to her operations; if you procure the metallic seed, and ripen that by art which she is many ages in perfecting, it cannot fail but she will regard you with an increase proportioned to the excellency of your subject.

"The reader will be apt to exclaim here: "Very fine! All this is well; but how shall the seed of metals be procured, and whence comes it that so few know how to gather it?" To this it is answered that the philosophers have hitherto industriously kept that a profound secret; some out of selfish disposition, though otherwise good men. Others, who wished only for worthy persons to whom they might impart it, could not write of it openly, because covetousness and vanity have been governing principles in the world: and, being wise men, they knew that it was not the will of the most High to inflame and cherish such odious tempers, the genuine offspring of pride and self-love, but to banish them out of the earth, wherefore they have been withheld hitherto. But we, finding no restraint on our mind in that respect, shall declare what we know: and the rather because we judge the time is come to demolish the golden calf, so long had in veneration by all ranks of men, insomuch that worth is estimated by the money a man possesses; and such is the inequality of possessions that mankind are almost reducible to the rich, who are rioting in extravagance, and the poor, who are in extreme want, smarting under the iron hand of oppression. Now the measure of inequality among the rich hastens to its limit, and the cry of the poor is come before the Lord: "Who will give them to eat till they shall be satisfied?"

Hereafter the rich shall see the vanity of their possessions when compared with the treasures communicated by this secret; for the riches it bestows are a blessing from God, and not the squeezing of oppression. Besides, its chief excellence consists in making a medicine capable of healing all diseases to which the human body is liable, and prolonging life to the utmost limits ordained by the Creator of all things.

There want not other reasons for the manifestation of the process; for skepticism has gone hand in hand with luxury and oppression, insomuch that the fundamental truths of all revealed religion are disputed. These were always held in veneration by the possessors of this art, as may be seen from what they have left upon record in their books: and, indeed, the first principles of revealed religion are demonstrated from the whole process, for the seed of metals is shown in corruption, and raised in

incorruption; it is sown a natural body, and raised a spiritual body; it is known to partake of the curse which came upon the earth for man's sake, having in its composition a deadly poison, which can only be separated by regeneration in water and fire; it can, when it is thoroughly purified and exalted, immediately tinge imperfect metals and raise them to a state of perfection, being in this respect a lively emblem of that seed of the woman, the Serpent Bruiser, who, through His sufferings and death, hath entered into glory, having thenceforth power and authority to redeem, purify, and glorify all those who come unto Him as a mediator between God and mankind.

Such being our motives, we can no longer be silent concerning the seed of metals, but declare that it is contained in the ores of metals, as wheat is in the grain; and the sottish folly of alchemists has hindered them from adverting to this, so that they have always sought it in the vulgar metals, which are factitious and not a natural production, therein acting as foolishly as if a man should sow bread and expect corn from it, or from an egg which is boiled hope to produce a chicken. Nay, though the philosophers have said many times the vulgar metals are dead, not excepting gold, which passes the fire, they could never imagine a thing so simple as that the seed of metals was contained in their ores, where alone it ought to be expected; so bewildered is human ingenuity, when it leaves the beaten track of truth and Nature, to entangle itself in a multiplicity of fine-spun inventions.

The searcher of Nature will rejoice greatly in this discovery, as grounded in reason and sound philosophy, but to fools it would be in vain, should even wisdom herself cry out in the streets. Wherefore, leaving such persons to hug themselves in their own imaginary importance, we shall go on to observe that the ores of metals are our First Matter, or sperm, wherein the seed is contained, and the key of this art consists in a right dissolution of the ores into a water, which the philosophers call their mercury, or water of life, and an earthy substance, which they have denominated their sulphur.

The first is called their woman, wife, Luna, and other names, signifying that it is the feminine quality in their seed; and the other they have designated their man, husband, Sol, etc., to point out its masculine quality.

In the separation and due conjunction of these with heat, and careful management, there is generated a noble offspring, which they have for its excellency called the quintessence or a subject wherein the four elements are so completely harmonized as to produce a fifth subsisting in the fire, without waste of substance, or diminution of its virtue, wherefore they have given it the titles of Salamander, Phoenix, and Son of the Sun.

## CHAPTER VI. Of the Dissolution and Extraction of the Seed in Metals.

The true Sons of Science have always accounted the dissolution of metals as the master key to this art, and have been particular in giving directions concerning it, only keeping their readers in the dark as to the subject, whether ores, or factitious metals, were to be chosen: nay, when they say most to the purpose, then they make mention of metals rather than the ores, with an intention to perplex those whom they thought unworthy of the art.

Thus the author of the "Philosophical Duet," or a dialogue between the stone, gold, and mercury, says:

"By the omnipotent God, and on the salvation of my soul, I here declare to you earnest seekers, in pity to your earnest searching, the whole Philosophical Work, which is only taken from one subject and perfected in one thing. For we take this copper, and destroy it crude and gross body; we draw out its pure spirit, and after we have purified the earthy parts, we join them together, thus making a Medicine of a Poison.

It is remarkable that he avoids mentioning the ore, but calls his subject copper, which is what they call a metal of the vulgar, being indeed factitious, and not fit for the confection of our Stone, having lost its seminal quality in the fire; but in other respects it is the plainest discovery extant, and is accounted to be so by Sendivogius.

Yet the reader is not to suppose that the ore of copper is to be chosen in consequence of that assertion, as preferable to others. No, the mercury, which is the metallic seed, is attainable from all, and is easier to be extracted from lead, which is confirmed by the true adepts, advising us to seek for the noble child where it lies in a despised form, shut up under the seal of Saturn; and, indeed, let it be supposed, for an illustration of this subject, that any one would propose to make malt, he may effect his purpose in the other grains, but barley is generally chosen, because its germ is made to sprout by a less tedious process, which is to all intents and purposes what we want in the extraction of our mercury: neither are the proceeding different in both cases, if regard is had to the fixity of ores, and the ease with which barley gives forth its seminal virtue from the slight cohesion of its parts.

Let the artist remark how a maltster manages his grain by wetting, to loosen the cohesion of its parts, and leaves the rest to Nature, knowing that she will soon furnish the necessary heat for his purpose, if he does not suffer it to escape by mismanagement in his laying of his heap too thin, or raising the fermentation too high by a contrary proceeding, as it is well known actual fire may be kindled from the fermentation of vegetable juices when crude; and ripe corn, under such treatment, would soon be fit for nothing but hogs, or the dunghill. Now the intention is to raise such a fermentation only as will draw out the vegetable mercury without spoiling it, either for the earth, if it was cast there to fructify, or the kiln, if it is to be fixed at that precise point, by exhaling the Adventitious moisture, and thus preserving the whole strength of its seminal quality for the purposes of brewing, or making malt spirits.

Suppose, then, an artist would extract a mineral mercury from the ores, and chooses an ore for his subject. He can only assist Nature in the process by stirring up a central heat, which she includes in everything not already putrefied, as a root of its life, in which it is increased. The medium by which this central heat is put in motion is known to be putrefaction; but the ores of every kind are found to resist putrefaction in all known processes extant. They may, indeed, when they have been fluxed in the fire, contract a rust from the air, which is a gradual decomposition of their substance, but this is only the natural decay of a dead body, not the putrefaction of its sperm for the purposes of propagation; and we are sensible from the heat of furnaces which is required to flux the ores, and the slowness of their decay when deprived of their seminal qualities, by fluxation, that a heat which would destroy the seed in vegetables may be necessary in the first stages of putrefaction for the ores, as they will bear a red fire without being fluxed or losing anything but their sulphureous and arsenical impurities; in short, a matter in itself as much extraneous to the seed of metals, as the chaff to the wheat; wherefore, a careful separation of these by roasting, or otherwise, is deservedly reckoned among the first operations for the putrefaction of ores, and the rather because that which has been calcined, by having its pores opened, is rendered attractive, both of the air and other menstrooms proper for its decomposition.

Let the artist, therefore, by fire and manual operation, separate the impure qualities from his subject, pounding, washing, and calcining, till no more blackness is communicated to his menstruum, for which pure rain water is sufficient. It will be seen on every repetition of this process, that what fouls the water is extraneous and the ore yet exists in its individual metallic nature, except it is fluxed by a too intense heat, in which case it is no longer fit for our purpose; therefore fresh ore is to be used.

The matter being thus prepared, its central fire will be awakened, if it is treated properly, according to the process for extracting quicksilver from its ores, by keeping it in a close heat, which is continued without admission of the crude air, till the radical moisture is elevated in the form of a vapor, and again condensed into a metallic water, analogous to quicksilver.

This is the true mercury of the Philosophers, and fit for all their operations in the Hermetic Art.

## CHAPTER VII.

### Of the Separation and Further Treatment of our Philosophical Seed.

The Putrefaction of our subject being thus completed, it exists under two forms; the moisture which was extracted, and the residuum, being our Philosophical Earth. The water contains its seminal virtue, and the earth is a proper receptacle, wherein it may fructify. Let the water, then, be separated and kept for use; calcine the earth, for an impurity adheres to it which can only be taken away by fire, and that, too, of the strongest degree; for here there is no danger of destroying the seminal quality, and our earth must be highly purified before it can ripen the seed. This is what Sendivogius means when he says: Burn the sulphur till it becomes Sulphur incombustible. Many lose in the preparation what is of most use in the art; for our mercury is corrected (healed) by the sulphur, else it would be of no use. Let, therefore, the earthy part be well calcined, and return the mercury on the calcined earth; afterwards draw it off by distillation; then calcine, cohere, and distill, repeating the process till the mercury is well corrected by the sulphur, and the sulphur is purified to a whiteness, and goes on to red, a sign of its complete purification, where you have the Philosophical Male and Female ready for conjunction. This must now be managed with judgment, as the noble child may be yet strangled in the birth; but all things are easy to an ingenious artist, who knows the proportion of mixture required and accommodates his operations to the intention of Nature, for which purpose we shall faithfully conduct him according to our ability.

**CHAPTER VIII.**  
**Of the Union or Mystical Marriage in the Philosophical Process.**

The seed and its earth being thus prepared, nothing remains but a judicious conjunction of them together; for it too much moisture prevails, the philosophical egg may burst before it can go through the heat necessary for its hatching. To speak without a figure. Our subject must now be enclosed in a small glass vial, made strong enough to bear a due heat, which is to be raised gradually to the highest degree: the best form for this vessel being that of an oil flask, with a long neck; but these are much too thin in substance for this operation. In such a vessel the mixture is to be sealed hermetically, and digested so long till it is fixed into a dry concretion; but, if, as we observed, the moisture should predominate, there is great danger of the vessel bursting, with a vapor which cannot be centered by the fixing quality in the matter. The intention is, nevertheless, to fix our subject in the heat, and so render its future destruction impossible.

On the other hand, if the dry, fixing quality of the sulphur exceeds so as not to suffer an alternate resolution of its substance into vapors, and a re-manifestation of its fixing quality, by causing the whole to subside in the bottom of the vessel till the matter again liquefies and sublimes (which Ripley has well described), there is danger of the whole vitrifying; and thus you shall have only glass instead of the noble tincture. To avoid these two extremes it is very proper that the purified earth be reduced by manual operation to an impalpable fineness, and then its corrected mercury must be added, incorporating both together till the earth will imbibe no more. This operation will require time, with some degree of the artist's patience; for however the humidity may seem disproportionate, on letting it rest awhile, a dryness on the surface of your matter will show that it is capable of imbibing more, so that the operation is to be repeated till it is fully saturated, which may be known from its bearing the air without any remarkable change of surface from dry to humid; or, on the contrary, if so, the conjunction is well made, which is farther confirmed if a small portion be spread upon a thin plate of iron, heated till it flows gently like wax, casting forth the moisture with heat and again absorbing it when cold, so as to return to the former consistence; but if a clamminess ensues it is a sign you have exceeded in the quantity of humidity, which must be extracted by distilling again and repeating the process till it is right.

Your sulphur and mercury being thus united, put them into a glass vial, before described, in such a quantity as to take up one-third of its contents, leaving two-thirds, including the neck, for the circulation of your matter.

Secure the neck of your vial with a temporary luting at the first, and give a gentle heat, observing whether it sublimes and fixes alternately. If it easily sublimes and shows a disposition, at intervals, to subside at the bottom of the vessel, all is well conducted hitherto; for the moisture will first be predominant, which the sulphur can only perfectly absorb as the heat is increased for the perfect ripening of our Paradisiacal Fruit. Therefore, if it manifests a too early disposition for fixing, add more of the corrected mercury till Luna rises resplendent in her season; she will give place to the Sun in his turn. This would be the language of an adept on this occasion, only suggesting that the female quality in our prepared seed is first active, while the

male is passive, and that it is afterwards passive while the male is active, such being the case in all vegetation; for every germ which is the first rudiments of a herb or tree, is predominant in moisture, and then only becomes fixed when it is fully concocted in the seed.

**CHAPTER IX.**  
**Of the Further Treatment and Ripening of our Seed.**

This is deservedly called the Great Work of the Philosophers; and the artist having done his part hitherto, must seal up his glass hermetically, an operation which every maker of barometers knows how to perform.

The glass is then to be put into a furnace with a proper nest contrived for its reception, so as to give a continual heat from the first to the fourth degree, and to afford the artist an opportunity, from time to time, of inspecting every change which his matter assumes during the process, without danger of damping the heat and putting a stop to its perfect circulation. A heat of the first degree is sufficient at the first, for some months, in which method much time may be lost by a young practitioner, till he knows how to handle his matter from experience; but then he is not so liable to be disappointed with the bursting of his vessel or the matter vitrifying.

Thus you have arrived at the desired seed-time in our Philosophical Work, which, though it may appear in the artist's power to ripen, depends no less on the Divine blessing than the harvest, which a painful husbandman has not the presumption to expect otherwise than from God's beneficence.

There are many requisites to entitle anyone to the possession of our philosophical harvest, and the true laborers in it have sought for such persons to whom they might communicate it, by evident testimony of the senses, after which they account the confection of our Stone an easy process, manageable by women and children; but without such a communication, there is a necessity that those who would undertake it are endowed by Nature with an ingenious mind, patient to observe and accurate to investigate her ordinary appearances which, from their commonness, are less noticed than such phenomena as are more curious though of less importance; yet these for the most part employ the precious time of those egregious triflers, the modern virtuosi. These smatterers in discovery of a shell or butterfly differently streaked from those of the same kind: and all the while water, air, earth, fire, with their continual changes and resolutions into one another, by the medium of our atmosphere, through the efficacy of the central and solar heat, are unstudied by these would-be philosophers; so that a sensible rustic has more real knowledge, in this respect, than a collector of natural rarities, and makes a much wiser use of the experiences he has acquired.

**CHAPTER X.**  
**Of the Further Process to the Ripening of our Noble Seed.**

Supposing such dispositions in the artist as have been previously laid down, and the work well performed hitherto, for his direction herein we shall describe the changes which our subject undergoes during the second part of the process, commonly called the Great Work of the Philosophers.

Our vessel being warily heated at the first for fear of its cracking, an ebullition of the contained matter is brought on, so that the moisture is alternately circulated in white fumes above, and condensed below, which may continue for a month or two, nay longer, increasing the heat gradually to another degree, as your matter discovers a disposition for fixing, by the vapor continuing at longer intervals condensed, and rising in a lesser quantity, of an ash color, or other dark shades, which it will assume as a medium to perfect blackness, the first desirable stage in our harvest. Other colors may be exhibited in this part of the work without danger, if they pass transiently; but if a faint redness, like that of the corn poppy, continues, the matter is in danger of vitrifying, either from an impatient urging of the fire, or the moisture not being sufficiently predominant. An ingenious artist can remedy this by opening his vessel and adding more of the corrected mercury, sealing it up as before; but a novice would do much better to prevent it by governing his fire according to the appearances of his matter, with judgment and patience, increasing it if the moisture manifests its predominancy too long, and slacking if the dry prevails, till such time as the vapors become dark; and after they have continued for some time at rest, a pellicle or film on the matter shows its disposition for fixing, retaining the vapor captive for some time, till it breaks through at different places on its surface (much like the bituminous substance of coal in a soldering fire), with darker clouds, but quickly dissipated, and growing less in quantity, till the whole substance resembles molten pitch, or the aforesaid bituminous substance, bubbling less and less, resting in one entire black substance at the bottom of your glass. This is called the blackness of black, the head of the crow, etc., and is esteemed a desirable stage in our philosophical generation, being the perfect putrefaction of our seed, which will ere long show its vital principle by a glorious manifestation of Seminal Virtue.

**CHAPTER XI**  
**A Further Description of the Process.**

When the putrefaction of our seed has been thus completed, the fire may be increased till glorious colors appear, which the Sons of Art have called Cauda Pavonis, or the Peacock's Tail. These colors come and go, as heat is administered approaching to the third degree, till all is of a beautiful green, and as it ripens assumes a perfect whiteness, which is the White Tincture, transmuting the inferior metals into silver, and very powerful as a medicine. But as the artist well knows it is capable of a higher concoction, he goes on increasing his fire till it assumes a yellow, then an orange or citron color; and then boldly gives a heat of the fourth degree, till it acquires a redness like blood taken from a sound person, which is a manifest sign of its thorough concoction and fitness for the uses intended.

## **CHAPTER XII.** **Of the Stone and its Uses.**

Having thus completed the operation, let the vessel cool, and on opening it you will perceive your matter to be fixed into a ponderous mass, thoroughly of a scarlet color, which is easily reducible to powder by scraping, or otherwise, and in being heated in the fire flows like wax, without smoking, flaming, or loss of substance, returning when cold to its former fixity, heavier than gold, bulk for bulk, yet easy to be dissolved in any liquid, in which a few grains being taken its operation most wonderfully pervades the human body, to the extirpation of all disorders, prolonging life by its use to its utmost period; and hence it has obtained the appellation of "Panacea,"

or a Universal Remedy. Therefore, be thankful to the Most High for the possession of such an inestimable jewel, and account the possession of it not as the result of your own ingenuity, but a gift bestowed, of God's mere bounty, for the relief of human infirmities, in which your neighbor ought to share jointly with you, without any grudging or sinister views, according to the charge delivered to the Apostles: Freely have you received, freely communicate, remembering at the same time not to cast your pearls before swine; in a word, to withhold the manifestations of Nature you are enabled to exhibit, by the possession of our Stone, from the vicious and unworthy.

### **CHAPTER XIII.** **Of the Transmutation.**

It is much to be lamented that the seekers of natural knowledge in this art propose, principally, the Science of Transmutation as their ultimate view, and overlooking the chief excellency of our Stone as a medicine.

Notwithstanding this grovelling spirit, we shall commit the issue to His Providence, and declare the Transmutation (which, indeed, the philosophers do) openly, after which we shall describe the further circulation of our Stone for an increase of its virtues, and then make an end of our treatise.

When the artist would transmute any metal- for instance, lead- let a quantity be melted in a clean crucible, to which let a few grains of gold in filings be cast; and when the whole is melted, let him have in readiness a little of the powder, which will easily scrape off from his "stone," the quantity inconsiderable, and cast it on the metal while in fusion.

Immediately there will arise a thick fume, which carries off with it the impurities contained in the lead, with a crackling noise, and leaves the substance of the lead transmuted into most pure gold, without any kind of sophistication; the small quantity of gold added, previous to projection, serves only as a medium to facilitate the transmutation, and the quantity of your tincture is best ascertained by experience, as its virtue is proportioned to the number of circulations you have given after the first has been completed.

For instance: when you have finished the stone, dissolve it in our mercury again, wherein you have previously dissolved a few grains of pure gold. This operation is done without trouble, both substances readily liquefying. Put it into your vessel, as before, and go through the process. There is no danger in the management, but breaking your vessel; and every time it is thus treated its virtues are increased, in a ratio of ten to one hundred, a thousand, ten thousand, etc., both in medicinal and transmuting qualities; so that a small quantity may suffice for the purposes of an artist during the remaining term of his life.

# THE AURORA OF THE PHILOSOPHERS.

BY THEOPHRASTUS PARACELSUS.

WHICH HE OTHERWISE CALLS HIS MONARCHIA.<sup>1</sup>

## CHAPTER I.

### CONCERNING THE ORIGIN OF THE PHILOSOPHERS' STONE.

ADAM was the first inventor of arts, because he had knowledge of all things as well after the Fall as before<sup>2</sup>. Thence he predicted the world's destruction by water. From this cause, too, it came about that his successors erected two tables of stone, on which they engraved all natural arts in hieroglyphical characters, in order that their posterity might also become acquainted with this prediction, that so it might be heeded, and provision made in the time of danger. Subsequently, Noah found one of these tables under Mount Araroth, after the Deluge. In this table were described the courses of the upper firmament and of the lower globe, and also of the planets. At length this universal knowledge was divided into several parts, and lessened in its vigour and power. By means of this separation, one man became an astronomer, another a magician, another a cabalist, and a fourth an alchemist. Abraham, that Vulcanic Tubalcain, a consummate astrologer and arithmetician, carried the Art out of the land of Canaan into Egypt, whereupon the Egyptians rose to so great a height and dignity that this wisdom was derived from them by other nations. The patriarch Jacob painted, as it were, the sheep with various colours; and this was done by magic: for in the theology of the Chaldeans, Hebrews, Persians, and Egyptians, they held these arts to be the highest philosophy, to be learnt by their chief nobles and priests. So it was in the time of Moses, when both the priests and also the physicians were chosen from among the Magi – the priests for the judgment of what related to health, especially in the knowledge of leprosy. Moses, likewise, was instructed in the Egyptian schools, at the cost and care of Pharaoh's daughter, so that he excelled in all the wisdom and learning of that people. Thus, too, was it with Daniel, who in his youthful days imbibed the learning of the Chaldeans, so that he became a cabalist. Witness his divine predictions and his exposition of those words, "Mene, Mene, Tecelphares". These words can be understood by the prophetic and cabalistic Art. This cabalistic Art was perfectly familiar to, and in constant use by, Moses and the Prophets. The Prophet Elias foretold many things by his cabalistic numbers. So did the Wise Men of old, by this natural and mystical Art, learn to know God rightly. They abode in His laws, and walked in His statutes with great firmness. It is also evident in the Book of Samuel, that the Berelists did not follow the devil's part, but became, by Divine permission, partakers of visions and veritable apparitions, whereof we shall treat more at large in the Book of Supercelestial Things<sup>3</sup>. This gift is granted by the Lord God to those priests who walk in the Divine precepts. It was a custom among the Persians never to admit any one as king unless he were a Wise Man, pre-eminent in reality as well as in name. This is clear from the customary name of their kings; for they were called Wise Men. Such were those Wise Men and Persian Magi who came from the East to seek out the Lord Jesus, and are called natural priests. The Egyptians, also, having obtained this magic and philosophy from the Chaldeans and Persians, desired that their priests should learn the same wisdom; and they became so fruitful and successful therein that all the neighbouring countries admired them. For this reason Hermes was so truly named Trismegistus, because he was a king, a priest, a prophet, a magician, and a sophist of natural things. Such another was Zoroaster.

## CHAPTER II.

WHEREIN IS DECLARED THAT THE GREEKS DREW A LARGE PART

OF THEIR LEARNING FROM THE EGYPTIANS; AND HOW

IT CAME FROM THEM TO US.

When a son of Noah possessed the third part of the world after the Flood, this Art broke into Chaldaea and Persia, and thence spread into Egypt. The Art having been found out by the superstitious and idolatrous Greeks, some of them who were wiser than the rest betook themselves to the Chaldeans and Egyptians, so that they might draw the same wisdom from their schools. Since, however, the theological study of the law of Moses did not satisfy them, they trusted to their own peculiar genius, and fell away from the right foundation of those natural secrets and arts. This is evident from their fabulous conceptions, and from their errors respecting the doctrine of Moses. It was the custom of the Egyptians to put forward the traditions of that surpassing wisdom only in enigmatical figures and abstruse histories and terms. This was afterwards followed by Homer with marvellous poetical skill; and Pythagoras was also acquainted with it, seeing that he comprised in his writings many things out of the law of Moses and the Old Testament. In like manner, Hippocrates, Thales of Miletus, Anaxagoras, Democritus, and others, did not scruple to fix their minds on the same subject. And yet none of them were practised in the true Astrology, Geometry, Arithmetic, or Medicine, because their pride prevented this, since they would not admit disciples belonging to other nations than their own. Even when they had got some insight from the Chaldeans and Egyptians, they became more arrogant still than they were before by Nature, and without any diffidence propounded the subject substantially indeed, but mixed with subtle fictions or falsehoods; and then they attempted to elaborate a certain kind of philosophy which descended from them to the Latins. These in their turn, being educated herewith, adorned it with their own doctrines, and by these the philosophy was spread over Europe. Many academies were founded for the propagation of their dogmas and rules, so that the young might be instructed; and this system flourishes with the Germans, and other nations, right down to the present day.

## CHAPTER III.

### WHAT WAS TAUGHT IN THE SCHOOLS OF THE EGYPTIANS.

The Chaldeans, Persians, and Egyptians had all of them the same knowledge of the secrets of Nature, and also the same religion. It was only the names that differed. The Chaldeans and Persians called their doctrine Sophia and Magic<sup>4</sup>; and the Egyptians, because of the sacrifice, called their wisdom priestcraft. The magic of the Persians, and the theology of the Egyptians, were both of them taught in the schools of old. Though there were many schools and learned men in Arabia, Africa, and Greece, such as Albumazar, Abenzagel, Geber, Rhasis, and Avicenna among the Arabians; and among the Greeks, Machaon, Podalirius, Pythagoras, Anaxagoras, Democritus, Plato, Aristotle, and Rhodanus; still there were different opinions amongst them as to the wisdom of the Egyptian on points wherein they themselves differed, and whereupon they disagreed with it. For this reason Pythagoras could not be called a wise man, because the Egyptian priestcraft and wisdom were not perfectly taught, although he received therefrom many mysteries and arcana; and that Anaxagoras had received a great many as well, is clear from his discussions on the subject of Sol and its Stone, which he left behind him after his death. Yet he differed in many respects from the Egyptians. Even they would not be called wise men or Magi; but, following Pythagoras, they assumed the name of philosophy: yet they gathered no more than a few gleams like shadows from the magic of the Persians and the Egyptians. But Moses, Abraham, Solomon, Adam, and the wise men that came from the East to Christ, were true Magi, divine sophists and cabalists. Of this art and wisdom the Greeks knew very little or nothing at all; and therefore we shall leave this philosophical wisdom of the Greeks as being a mere speculation, utterly distinct and separate from other true arts and sciences.

## CHAPTER IV.

### WHAT MAGI THE CHALDEANS, PERSIANS, AND EGYPTIANS WERE.

Many persons have endeavoured to investigate and make use of the secret magic of these wise men; but it has not yet been accomplished. Many even of our own age exalt Trithemius, others Bacon and Agrippa, for magic and the cabala<sup>5</sup> – two things apparently quite distinct – not knowing why they do so. Magic, indeed, is an art and faculty whereby the elementary bodies, their fruits, properties, virtues, and hidden operations are comprehended. But the cabala, by a subtle understanding of the Scriptures, seems to trace out the way to God for men, to shew them how they may act with Him, and prophesy from Him; for the cabala is full of divine mysteries, even as Magic is full of natural secrets. It teaches of and foretells from the nature of things to come as well as of things present, since its operation consists in knowing the inner constitution of all creatures, of celestial as well as terrestrial bodies: what is latent within them; what are their occult virtues; for what they were originally designed, and with what properties they are endowed. These and the like subjects are the bonds wherewith things celestial are bound up with things of the earth, as may sometimes be seen in their operation even with the bodily eyes. Such a conjunction of celestial influences, whereby the heavenly virtues acted upon inferior bodies, was formerly called by the Magi a Gamahea<sup>6</sup>, or the marriage of the celestial powers and properties with elementary bodies. Hence ensued the excellent commixtures of all bodies, celestial and terrestrial, namely, of the sun and planets, likewise vegetables, minerals, and animals.

The devil attempted with his whole force and endeavour to darken this light; nor was he wholly frustrated in his hopes, for he deprived all Greece of it, and, in place thereof, introduced among that people human speculations and simple blasphemies against God and against His Son. Magic, it is true, had its origin in the Divine Ternary and arose from the Trinity of God. For God marked all His creatures with this Ternary and engraved its hieroglyph on them with His own finger. Nothing in the nature of things can be assigned or produced that lacks this magistry of the Divine Ternary, or that does not even ocularly prove it. The creature teaches us to understand and see the Creator Himself, as St. Paul testifies to the Romans. This covenant of the Divine Ternary, diffused throughout the whole substance of things, is indissoluble. By this, also, we have the secrets of all Nature from the four elements. For the Ternary, with the magical Quaternary, produces a perfect Septenary, endowed with many arcana and demonstrated by things which are known. When the Quaternary rests in the Ternary, then arises the Light of the World on the horizon of eternity, and by the assistance of God gives us the whole bond. Here also it refers to the virtues and operations of all creatures, and to their use, since they are stamped and marked with their arcana, signs, characters, and figures, so that there is left in them scarcely the smallest occult point which is not made clear on examination. Then when the Quaternary and the Ternary mount to the Denary is accomplished their retrogression or reduction to unity. Herein is comprised all the occult wisdom of things which God has made plainly manifest to men, both by His word and by the creatures of His hands, so that they may have a true knowledge of them. This shall be made more clear in another place.

## CHAPTER V.

### CONCERNING THE CHIEF AND SUPREME ESSENCE OF THINGS.

The Magi in their wisdom asserted that all creatures might be brought to one unified substance, which substance they affirm may, by purifications and purgations, attain to so high a degree of subtlety, such divine nature and occult property, as to work wonderful results. For they considered that by returning to the earth, and by a supreme magical separation, a certain perfect substance would come forth, which is at length, by many industrious and prolonged preparations, exalted and raised up above the range of vegetable substances into mineral, above mineral into metallic, and above perfect metallic substances into a perpetual and divine Quintessence<sup>7</sup>, including in itself the essence of all celestial and terrestrial creatures. The Arabs and Greeks, by the occult characters and hieroglyphic descriptions of the Persians and the Egyptians, attained to secret and abstruse mysteries. When these were obtained and partially understood they saw with their own eyes, in the course of experimenting, many wonderful and strange effects. But since the supercelestial operations lay more deeply hidden than their capacity could penetrate, they did not call this a supercelestial arcanum according to the institution of the Magi, but the arcanum of the Philosophers' Stone according to the counsel and judgment of Pythagoras. Whoever obtained this Stone overshadowed it with various enigmatical figures, deceptive resemblances, comparisons, and fictitious titles, so that its matter might remain occult. Very little or no knowledge of it therefore can be had from them.

## CHAPTER VI.

### CONCERNING THE DIFFERENT ERRORS AS TO ITS DISCOVERY AND KNOWLEDGE.

The philosophers have prefixed most occult names to this matter of the Stone, grounded on mere similitudes. Arnold, observing this, says in his "Rosary" that the greatest difficulty is to find out the material of this Stone; for they have called it vegetable, animal, and mineral, but not according to the literal sense, which is well known to such wise men as have had experience of divine secrets and the miracles of this same Stone. For example, Raymond Lully's "Lunaria" may be cited. This gives flowers of admirable virtues familiar to the philosophers themselves; but it was not the intention of those philosophers that you should think they meant thereby any projection upon metals, or that any such preparations should be made; but the abstruse mind of the philosophers had another intention. In like manner, they called their matter by the name of Martagon, to which they applied an occult alchemical operation; when, notwithstanding that name, it denotes nothing more than a hidden similitude. Moreover, no small error has arisen in the liquid of vegetables, with which a good many have sought to coagulate Mercury<sup>8</sup>, and afterwards to convert it with fixatory waters into Luna, since they supposed that he who in this way could coagulate it without the aid of metals would succeed in becoming the chief master. Now, although the liquids of some vegetables do effect this, yet the result is due merely to the resin, fat, and earthy sulphur with which they abound. This attracts to itself the moisture of the Mercury which rises with the substance in the process of coagulation, but without any advantage resulting. I am well assured that no thick and external Sulphur in vegetables is adapted for a perfect projection in Alchemy, as some have found out to their cost. Certain persons have, it is true, coagulated Mercury with the white and milky juice of tittinal, on account of the intense heat which exists therein; and they have called that liquid "Lac Virginis"; yet this is a false basis. The same may be asserted concerning the juice of celandine, although it colours just as though it were endowed with gold. Hence people conceived a vain idea. At a certain fixed time they rooted up this vegetable, from which they sought for a soul or quintessence, wherefrom they might make a coagulating and transmuting tincture. But hence arose nothing save a foolish error.

## CHAPTER VII.

### CONCERNING THE ERRORS OF THOSE WHO SEEK THE STONE IN VEGETABLES.

Some alchemists have pressed a juice out of celandine, boiled it to thickness, and put it in the sun, so that it might coagulate into a hard mass, which, being afterwards pounded into a fine black powder, should turn Mercury by projection into Sol. This they also found to be in vain. Others mixed Sal Ammoniac with this powder; others the Colcothar of Vitriol, supposing that they would thus arrive at their desired result. They brought it by their solutions into a yellow water, so that the Sal Ammoniac allowed an entrance of the tincture into the substance of the Mercury. Yet again nothing was accomplished. There are some again who, instead of the abovementioned substances, take the juices of persicaria, bufonaria, dracunculus, the leaves of willow, tithymal, cataputia, flammula, and the like, and shut them up in a glass vessel with Mercury for some days, keeping them in ashes. Thus it comes about that the Mercury is turned into ashes, but deceptively and without any result. These people were misled by the vain rumours of the vulgar, who give it out that he who is able to coagulate Mercury without metals has the entire Magistery, as we have said before. Many, too, have extracted salts, oils, and sulphurs artificially out of vegetables, but quite in vain. Out of such salts, oils, and sulphurs no coagulation of Mercury, or perfect projection, or tincture, can be made. But when the philosophers compare their matter to a certain golden tree of seven boughs, they mean that such matter includes all the seven metals in its sperm, and that in it these lie hidden. On this account they called their matter vegetable, because, as in the case of natural trees, they also in their time produce various flowers. So, too, the matter of the Stone shews most beautiful colours in the production of its flowers. The comparison, also, is apt, because a certain matter rises out of the philosophical earth, as if it were a thicket of branches and sprouts: like a sponge growing on the earth. They say, therefore, that the fruit of their tree tends towards heaven. So, then, they put forth that the whole thing hinged upon natural vegetables, though not as to its matter, because their stone contains within itself a body, soul, and spirit, as vegetables do.

## CHAPTER VIII.

### CONCERNING THOSE WHO HAVE SOUGHT THE STONE IN ANIMALS.

They have also, by a name based only on resemblances, called this matter *Lac Virginis*, and the Blessed Blood of Rosy Colour, which, nevertheless, suits only the prophets and sons of God. Hence the sophists<sup>9</sup> gathered that this philosophical matter was in the blood of animals or of man. Sometimes, too, because they are nourished by vegetables, others have sought it in hairs, in salt of urine, in rebis; others in hens' eggs, in milk, and in the calx of egg shells, with all of which they thought they would be able to fix Mercury. Some have extracted salt out of foetid urine, supposing that to be the matter of the Stone. Some persons, again, have considered the little stones found in rebis to be the matter. Others have macerated the membranes of eggs in a sharp lixivium, with which they also mixed calcined egg shells as white as snow. To these they have attributed the arcanum of fixation for the transmutation of Mercury. Others, comparing the white of the egg to silver and the yolk to gold, have chosen it for their matter, mixing with it common salt, sal ammoniac, and burnt tartar. These they shut up in a glass vessel, and purified in a *Balneum Maris* until the white matter became as red as blood. This, again, they distilled into a most offensive liquid, utterly useless for the purpose they had in view. Others have purified the white and yolk of eggs; from which has been generated a basilisk. This they burnt to a deep red powder, and sought to tinge with it, as they learnt from the treatise of Cardinal Gilbert. Many, again, have macerated the galls of oxen, mixed with common salt, and distilled this into a liquid, with which they moistened the cementary powders, supposing that, by means of this Magistry, they would tinge their metals. This they called by the name of "a part with a part", and thence came – just nothing. Others have attempted to transmute tutia by the addition of dragon's blood and other substances, and also to change copper and electrum into gold. Others, according to the Venetian Art, as they call it, take twenty lizard-like animals, more or less, shut them up in a vessel, and make them mad with hunger, so that they may devour one another until only one of them survives. This one is then fed with filings of copper or of electrum. They suppose that this animal, simply by the digestion of his stomach, will bring about the desired transmutation. Finally, they burn this animal into a red powder, which they thought must be gold; but they were deceived. Others, again, having burned the fishes called truitas (? trouts), have sometimes, upon melting them, found some gold in them; but there is no other reason for it than this: Those fish sometimes in rivers and streams meet with certain small scales and sparks of gold, which they eat. It is seldom, however, that such deceivers are found, and then chiefly in the courts of princes. The matter of the philosophers is not to be sought in animals: this I announce to all. Still, it is evident that the philosophers called their Stone animal, because in their final operations the virtue of this most excellent fiery mystery caused an obscure liquid to exude drop by drop from the matter in their vessels. Hence they predicted that, in the last times, there should come a most pure man upon the earth, by whom the redemption of the world should be brought about; and that this man should send forth bloody drops of a red colour, by means of which he should redeem the world from sin. In the same way, after its own kind, the blood of their Stone freed the leprous metals from their infirmities and contagion. On these grounds, therefore, they supposed they were justified in saying that their Stone was animal. Concerning this mystery Mercurius speaks as follows to King Calid: –

"This mystery it is permitted only to the prophets of God to know. Hence it comes to pass that this Stone is called animal, because in its blood a soul lies hid. It is likewise composed of body, spirit, and soul. For the same reason they called it their microcosm, because it has the likeness of all things in the world, and thence they termed it animal, as Plato named the great world an animal".

## CHAPTER IX.

### CONCERNING THOSE WHO HAVE SOUGHT THE STONE IN MINERALS.

Hereto are added the many ignorant men who suppose the stone to be three-fold, and to be hidden in a triple genus, namely, vegetable, animal, and mineral. Hence it is that they have sought for it in minerals. Now, this is far from the opinion of the philosophers. They affirm that their stone is uniformly vegetable, animal, and mineral. Now, here note that Nature has distributed its mineral sperm into various kinds, as, for instance, into sulphurs, salts, boraxes, nitres, ammoniacs, alums, arsenics, atraments, vitriols, tutias, haematites, orpiments, realgars, magnesias, cinnabar, antimony, talc, cachymia, marcasites, etc. In all these Nature has not yet attained to our matter; although in some of the species named it displays itself in a wonderful aspect for the transmutation of imperfect metals that are to be brought to perfection. Truly, long experience and practice with fire shew many and various permutations in the matter of minerals, not only from one colour to another, but from one essence to another, and from imperfection to perfection. And, although Nature has, by means of prepared minerals, reached some perfection, yet philosophers will not have it that the matter of the philosophic stone proceeds out of any of the minerals, although they say that their stone is universal. Hence, then, the sophists take occasion to persecute Mercury himself with various torments, as with sublimations, coagulations, mercurial waters, aquafortis, and the like. All these erroneous ways should be avoided, together with other sophisticated preparations of minerals, and the purgations and fixations of spirits and metals. Wherefore all the preparations of the stone, as of Geber, Albertus Magnus, and the rest, are sophisticated. Their purgations, cementations, sublimations, distillations, rectifications, circulations, putrefactions, conjunctions, solutions, ascensions, coagulations, calcinations, and incinerations are utterly profitless, both in the tripod, in the athanor, in the reverberatory furnace, in the melting furnace, the accidioneum, in dung, ashes, sand, or what not; and also in the cucurbite, the pelican, retort, phial, fixatory, and the rest. The same opinion must be passed on the sublimation of Mercury by mineral spirits, for the white and the red, as by vitriol, saltpetre, alum, crocuses, etc., concerning all which subjects that sophist, John de Rupescissa, romances in his treatise on the White and Red Philosophic Stone. Taken altogether, these are merely deceitful dreams. Avoid also the particular sophistry of Geber; for example, his sevenfold sublimations or mortifications, and also the revivifications of Mercury, with his preparations of salts of urine, or salts made by a sepulchre, all which things are untrustworthy. Some others have endeavoured to fix Mercury with: the sulphurs of minerals and metals, but have been greatly deceived. It is true I have seen Mercury by this Art, and by such fixations, brought into a metallic body resembling and counterfeiting good silver in all respects; but when brought to the test it has shewn itself to be false.

## CHAPTER X.

### CONCERNING THOSE WHO HAVE SOUGHT THE STONE AND ALSO PARTICULARS IN MINERALS.

Some sophists have tried to squeeze out a fixed oil from Mercury seven times sublimed and as often dissolved by means of aquafortis. In this way they attempt to bring imperfect metals to perfection: but they have been obliged to relinquish their vain endeavour. Some have purged vitriol seven times by calcination, solution, and coagulation, with the addition of two parts of sal ammoniac, and by sublimation, so that it might be resolved into a white water, to which they have added a third part of quicksilver, that it might be coagulated by water. Then afterwards they have sublimated the Mercury several times from the vitriol and sal ammoniac, so that it became a stone. This stone they affirmed, being conceived of the vitriol, to be the Red Sulphur of the philosophers, with which they have, by means of solutions and coagulations, made some progress in attaining the stone; but in projection it has all come to nothing. Others have coagulated Mercury by water of alum into a hard mass like alum itself; and this they have fruitlessly fixed with fixatory waters. The sophists propose to themselves very many ways of fixing Mercury, but to no purpose, for therein nothing perfect or constant can be had. It is therefore in vain to add minerals thereto by sophisticated processes, since by all of them he is stirred up to greater malice, is rendered more lively, and rather brought to greater impurity than to any kind of perfection. So, then, the philosophers' matter is not to be sought from thence. Mercury is somewhat imperfect; and to bring it to perfection will be very difficult, nay, impossible for any sophist. There is nothing therein that can be stirred up or compelled to perfection. Some have taken arsenic several times sublimated, and frequently dissolved with oil of tartar and coagulated. This they have pretended to fix, and by it to turn copper into silver. This, however, is merely a sophisticated whitening, for arsenic cannot be fixed<sup>10</sup> unless the operator be an Artist, and knows well its tingeing spirit. Truly in this respect all the philosophers have slept, vainly attempting to accomplish anything thereby. Whoever, therefore, is ignorant as to this spirit, cannot have any hopes of fixing it, or of giving it that power which would make it capable of the virtue of transmutation. So, then, I give notice to all that the whitening of which I have just now spoken is grounded on a false basis, and that by it the copper is deceitfully whitened, but not changed.

Now the sophists have mixed this counterfeit Venus with twice its weight of Luna, and sold it to the goldsmiths and mint-masters, until at last they have transmuted themselves into false coiners – not only those who sold, but those who bought it. Some sophists instead of white arsenic take red, and this has turned out false art; because, however it is prepared, it proves to be nothing but whiteness.

Some, again, have gone further and dealt with common sulphur, which, being so yellow, they have boiled in vinegar, lixivium, or sharpest wines, for a day and a night, until it became white. Then afterwards they sublimated it from common salt and the calx of eggs, repeating the process several times; yet, still, though white, it has been always combustible. Nevertheless, with this they have endeavoured to fix Mercury and to turn it into gold; but in vain. From this, however, comes the most excellent and beautiful cinnabar that I have ever seen. This they propose to fix with the oil of sulphur by cementation and fixation. It does, indeed, give something of an

appearance, but still falls short of the desired object. Others have reduced common sulphur to the form of a hepar, boiling it in vinegar with the addition of linseed oil, or laterine oil, or olive oil. They then pour it into a marble mortar, and make it into the form of a hepar, which they have first distilled into a citrine oil with a gentle fire. But they have found to their loss that they could not do anything in the way of transmuting Luna to Sol as they supposed they would be able. As there is an infinite number of metals, so also there is much variety in the preparation of them: I shall not make further mention of these in this place, because each a mould require a special treatise. Beware also of sophisticated oils of vitriol and antimony. Likewise be on your guard against the oils of the metals, perfect or imperfect, as Sol or Luna; because although the operation of these is most potent in the nature of things, yet the true process is known, even at this day, to very few persons. Abstain also from the sophisticated preparations of common mercury, arsenic, sulphur, and the like, by sublimation, descension, fixation by vinegar, saltpetre, tartar, vitriol, sal ammoniac, according to the formulas prescribed in the books of the sophists. Likewise avoid the sophisticated tinctures taken from marcasites and crocus of Mars, and also of that sophistication called by the name of "a part with a part", and of fixed Luna and similar trifles. Although they have some superficial appearance of truth, as the fixation of Luna by little labour and industry, still the progress of the preparation is worthless and weak. Being therefore moved with compassion towards the well meaning operators in this art, I have determined to lay open the whole foundation of philosophy in three separate arcana, namely, in one explained by arsenic, in a second by vitriol, and in a third by antimony; by means of which I will teach the true projection upon Mercury and upon the imperfect metals.

## CHAPTER XI.

### CONCERNING THE TRUE AND PERFECT SPECIAL ARCANUM OF ARSENIC FOR THE WHITE TINCTURE.

Some persons have written that arsenic is compounded of Mercury and, Sulphur, others of earth and water; but most writers say that it is of the nature of Sulphur. But, however that may be, its nature is such that it transmutes red copper into white. It may also be brought to such a perfect state of preparation as to be able to tinge. But this is not done in the way pointed out by such evil sophists as Geber in "The Sum of Perfection", Albertus Magnus, Aristotle the chemist in "The Book of the Perfect Magistry", Rhasis and Polydorus; for those writers, however many they be, are either themselves in error, or else they write falsely out of sheer envy, and put forth receipts whilst not ignorant of the truth. Arsenic contains within itself three natural spirits. The first is volatile, combustible, corrosive, and penetrating all metals. This spirit whitens Venus and after some days renders it spongy. But this artifice relates only to those who practise the caustic art. The second spirit is crystalline and sweet. The third is a tingeing spirit separated from the others before mentioned. True philosophers seek for these three natural properties in arsenic with a view to the perfect projection of the wise men<sup>11</sup>. But those barbers who practise surgery seek after that sweet and crystalline nature separated from the tingeing spirit for use in the cure of wounds, buboes, carbuncles, anthrax, and other similar ulcers which are not curable save by gentle means. As for that tingeing spirit, however, unless the pure be separated from the impure in it, the fixed from the volatile, and the secret tincture from the combustible, it will not in any way succeed according to your wish for projection on Mercury, Venus, or any other imperfect metal. All philosophers have hidden this arcanum as a most excellent mystery. This tingeing spirit, separated from the other two as above, you must join to the spirit of Luna, and digest them together for the space of thirty-two days, or until they have assumed a new body. After it has, on the fortieth natural day, been kindled into flame by the heat of the sun, the spirit appears in a bright whiteness, and is endued with a perfect tingeing arcanum. Then it is at length fit for projection, namely, one part of it upon sixteen parts of an imperfect body, according to the sharpness of the preparation. From thence appears shining and most excellent Luna, as though it had been dug from the bowels of the earth.

## CHAPTER XII.

### GENERAL INSTRUCTION CONCERNING THE ARCANUM OF VITRIOL AND THE RED TINCTURE TO BE EXTRACTED FROM IT.<sup>12</sup>

Vitriol is a very noble mineral among the rest, and was held always in highest estimation by philosophers, because the Most High God has adorned it with wonderful gifts. They have veiled its arcanum in enigmatical figures like the following: "Thou shalt go to the inner parts of the earth, and by rectification thou shalt find the occult stone, a true medicine". By the earth they understood the Vitriol itself; and by the inner parts of the earth its sweetness and redness, because in the occult part of the Vitriol lies hid a subtle, noble, and most fragrant juice, and a pure oil. The method of its production is not to be approached by calcination or by distillation. For it must not be deprived on any account of its green colour. If it were, it would at the same time lose its arcanum and its power. Indeed, it should be observed at this point that minerals, and also vegetables and other like things which shew greenness without, contain within themselves an oil red like blood, which is their arcanum. Hence it is clear that the distillations of the druggists are useless, vain, foolish, and of no value, because these people do not know how to extract the bloodlike redness from vegetables. Nature herself is wise, and turns all the waters of vegetables to a lemon colour, and after that into an oil which is very red like blood. The reason why this is so slowly accomplished arises from the too great haste of the ignorant operators who distil it, which causes the greenness to be consumed. They have not learnt to strengthen Nature with their own powers, which is the mode whereby that noble green colour ought to be rectified into redness of itself. An example of this is white wine digesting itself into a lemon colour; and in process of time the green colour of the grape is of itself turned into the red which underlies the coerulean. The greenness therefore of the vegetables and minerals being lost by the incapacity of the operators, the essence also and spirit of the oil and of the balsam, which is noblest among arcana, will also perish.

## CHAPTER XIII.

### SPECIAL INSTRUCTION CONCERNING THE PROCESS OF VITRIOL FOR THE RED TINCTURE.

Vitriol contains within itself many muddy and viscous imperfections. Therefore its greenness<sup>13</sup> must be often extracted with water, and rectified until it puts off all the impurities of earth. When all these rectifications are finished, take care above all that the matter shall not be exposed to the sun, for this turns its greenness pale, and at the same time absorbs the arcanum. Let it be kept covered up in a warm stove so that no dust may defile it. Afterwards let it be digested in a closed glass vessel for the space of several months, or until different colours and deep redness shew themselves. Still you must not suppose that by this process the redness is sufficiently fixed. It must, in addition, be cleansed from the interior and accidental defilements of the earth, in the following manner: – It must be rectified with acetum until the earthy defilement is altogether removed, and the dregs are taken away. This is now the true and best rectification of its tincture, from which the blessed oil is to be extracted. From this tincture, which is carefully enclosed in a glass vessel, an alembic afterwards placed on it and luted so that no spirit may escape, the spirit of this oil must be extracted by distillation over a mild and slow fire. This oil is much pleasanter and sweeter than any aromatic balsam of the drugsellers, being entirely free from all acidity<sup>14</sup>. There will subside in the bottom of the cucurbite some very white earth, shining and glittering like snow. This keep, and protect from all dust. This same earth is altogether separated from its redness.

Thereupon follows the greatest arcanum, that is to say, the Supercelestial Marriage of the Soul, consummately prepared and washed by the blood of the lamb, with its own splendid, shining, and purified body. This is the true supercelestial marriage by which life is prolonged to the last and predestined day. In this way, then, the soul and spirit of the Vitriol, which are its blood, are joined with its purified body, that they may be for eternity inseparable. Take, therefore, this our foliated earth in a glass phial. Into it pour gradually its own oil. The body will receive and embrace its soul; since the body is affected with extreme desire for the soul, and the soul is most perfectly delighted with the embrace of the body. Place this conjunction in a furnace of arcana, and keep it there for forty days. When these have expired you will have a most absolute oil of wondrous perfection, in which Mercury and any other of the imperfect metals are turned into gold.

Now let us turn our attention to its multiplication. Take the corporal Mercury, in the proportion of two parts; pour it over three parts, equal in weight, of the aforesaid oil, and let them remain together for forty days. By this proportion of weight and this order the multiplication becomes infinite.

## CHAPTER XIV.

### CONCERNING THE SECRETS AND ARCANA OF ANTIMONY, FOR THE RED TINCTURE, WITH A VIEW TO TRANSMUTATION.

Antimony is the true bath of gold. Philosophers call it the examiner and the stilanx. Poets say that in this bath Vulcan washed Phoebus, and purified him from all dirt and imperfection. It is produced from the purest and noblest Mercury and Sulphur, under the genus of vitriol, in metallic form and brightness. Some philosophers call it the White Lead of the Wise Men, or simply the Lead. Take, therefore, of Antimony, the very best of its kind, as much as you will. Dissolve this in its own aquafortis, and throw it into cold water, adding a little of the crocus of Mars, so that it may sink to the bottom of the vessel as a sediment, for otherwise it does not throw off its dregs. After it has been dissolved in this way it will have acquired supreme beauty. Let it be placed in a glass vessel, closely fastened on all sides with a very thick lute, or else in a stone boccia, and mix with it some calcined tutia, sublimated to the perfect degree of fire. It must be carefully guarded from liquefying, because with too great heat it breaks the glass. From one pound of this Antimony a sublimation is made, perfected for a space of two days. Place this sublimated substance in a phial that it may touch the water with its third part, in a luted vessel, so that the spirit may not escape. Let it be suspended over the tripod of arcana, and let the work be urged on at first with a slow fire equal to the sun's heat at midsummer. Then at length on the tenth day let it be gradually increased. For with too great heat the glass vessels are broken, and sometimes even the furnace goes to pieces. While the vapour is ascending different colours appear. Let the fire be moderated until a red matter is seen. Afterwards dissolve in very sharp Acetum, and throw away the dregs. Let the Acetum be abstracted and let it be again dissolved in common distilled water. This again must be abstracted, and the sediment distilled with a very strong fire in a glass vessel closely shut. The whole body of the Antimony will ascend as a very red oil, like the colour of a ruby, and will flow into the receiver, drop by drop, with a most fragrant smell and a very sweet taste<sup>15</sup>. This is the supreme arcanum of the philosophers in Antimony, which they account most highly among the arcana of oils. Then, lastly, let the oil of Sol be made in the following way: – Take of the purest Sol as much as you will, and dissolve it in rectified spirit of wine. Let the spirit be abstracted several times, and an equal number of times let it be dissolved again. Let the last solution be kept with the spirit of wine, and circulated for a month. Afterwards let the volatile gold and the spirit of wine be distilled three or four times by means of an alembic, so that it may flow down into the receiver and be brought to its supreme essence. To half an ounce of this dissolved gold let one ounce of the Oil of Antimony be added. This oil embraces it in the heat of the bath, so that it does not easily let it go, even if the spirit of wine be extracted. In this way you will have the supreme mystery and arcanum of Nature, to which scarcely any equal can be assigned in the nature of things. Let these two oils in combination be shut up together in a phial after the manner described, hung on a tripod for a philosophical month, and warmed with a very gentle fire; although, if the fire be regulated in dire proportion this operation is concluded in thirty-one days, and brought to perfection. By this, Mercury and any other imperfect metals acquire the perfection of gold.

## CHAPTER XV.

### CONCERNING THE PROJECTION TO BE MADE BY THE MYSTERY AND ARCANUM OF ANTIMONY.

No precise weight can be assigned in this work of projection, though the tincture itself may be extracted from a certain subject, in a defined proportion, and with fitting appliances. For instance, that Medicine tinges sometimes thirty, forty, occasionally even sixty, eighty, or a hundred parts of the imperfect metal. So, then, the whole business hinges chiefly on the purification of the Medicine and the industry of the operator, and, next, on the greater; or lesser cleanliness and purity of the imperfect body taken in hand. For instance, one Venus is more pure than another; and hence it happens that no one fixed weight can be specified in projection. This alone is worth noting, that if the operator happens to have taken too much of the tincture, he can correct this mistake by adding more of the imperfect metal. But if there be too much of the subject, so that the powers of the tincture are weakened, this error is easily remedied by a cineritium, or by cementations, or by ablutions in crude Antimony. There is nothing at this stage which need delay the operator; only let him put before himself a fact which has been passed over by the philosophers, and by some studiously veiled, namely, that in projections there must be a revivification, that is to say, an animation of imperfect bodies – nay, so to speak, a spiritualisation; concerning which some have said that their metals are no common ones, since they live and have a soul.

#### ANIMATION IS PRODUCED IN THE FOLLOWING WAY.

Take of Venus, wrought into small plates, as much as you will, ten, twenty, or forty pounds. Let these be incrustated with a pulse made of arsenic and calcined tartar, and calcined in their own vessel for twenty-four hours. Then at length let the Venus be pulverised, washed, and thoroughly purified. Let the calcination with abluition be repeated three or four times. In this way it is purged and purified from its thick greenness and from its own impure sulphur. You will have to be on your guard against calcinations made with common sulphur. For whatever is good in the metal is spoiled thereby, and what is bad becomes worse. To ten marks of this purged Venus add one of pure Luna. But in order that the work of the Medicine may be accelerated by projection, and may more easily penetrate the imperfect body, and drive out all portions which are opposed to the nature of Luna, this is accomplished by means of a perfect ferment. For the work is defiled by means of an impure Sulphur, so that a cloud is stretched out over the surface of the transmuted substance, or the metal is mixed with the loppings of the Sulphur and may be cast away therewith. But if a projection of a red stone is to be made, with a view to a red transmutation, it must first fall on gold, afterwards on silver, or on some other metal thoroughly purified, as we have directed above. From thence arises the most perfect gold.

## CHAPTER XVI.

### CONCERNING THE UNIVERSAL MATTER OF THE PHILOSOPHERS' STONE.

After the mortification of vegetables, they are transmuted, by the concurrence of two minerals, such as Sulphur and Salt, into a mineral nature, so that at length they themselves become perfect minerals. So it is that in the mineral burrows and caves of the earth, vegetables are found which, in the long succession of time, and by the continuous heat of sulphur, put off the vegetable nature and assume that of the mineral. This happens, for the most part, where the appropriate nutriment is taken away from vegetables of this kind, so that they are afterwards compelled to derive their nourishment from the sulphur and salts of the earth, until what was before vegetable passes over into a perfect mineral. From this mineral state, too, sometimes a perfect metallic essence arises, and this happens by the progress of one degree into another.

But let us return to the Philosophers' Stone. The matter of this, as certain writers have mentioned, is above all else difficult to discover and abstruse to understand. The method and most certain rule for finding out this, as well as other subjects – what they embrace or are able to effect – is a careful examination of the root and seed by which they come to our knowledge. For this, before all things else, a consideration of principles is absolutely necessary; and also of the manner in which Nature proceeds from imperfection to the end of perfection. Now, for this consideration it is well to have it thoroughly understood from the first that all things created by Nature consist of three primal elements, namely, natural Mercury, Sulphur, and Salt in combination, so that in some substances they are volatile, in others fixed. Wherever corporal Salt is mixed with spiritual Mercury and animated Sulphur into one body, then Nature begins to work, in those subterranean places which serve for her vessels, by means of a separating fire. By this the thick and impure Sulphur is separated from the pure, the earth is segregated from the Salt, and the clouds from the Mercury, while those purer parts are preserved, which Nature again welds together into a pure geogamic body. This operation is esteemed by the Magi as a mixture and conjunction by the uniting of three constituents, body, soul, and spirit. When this union is completed there results from it a pure Mercury. Now if this, when flowing down through its subterranean passages and veins, meets with a chaotic Sulphur, the Mercury is coagulated by it according to the condition of the Sulphur. It is, however, still volatile, so that scarcely in a hundred years is it transformed into a metal. Hence arose the vulgar idea that Mercury and Sulphur are the matter of the metals, as is certainly reported by miners. It is not, however, common Mercury and common Sulphur which are the matter of the metals, but the Mercury and the Sulphur of the philosophers are incorporated and inborn in perfect metals, and in the forms of them, so that they never fly from the fire, nor are they depraved by the force of the corruption caused by the elements. It is true that by the dissolution of this natural mixture our Mercury is subdued, as all the philosophers say. Under this form of words our Mercury comes to be drawn from perfect bodies and from the forces of the earthly planets. This is what Hermes asserts in the following terms: "The Sun and the Moon are the roots of this Art". The Son of Hamuel says that the Stone of the philosophers is water coagulated, namely, in Sol and Luna. From this it is clearer than the sun that the material of the Stone is nothing else but Sol and Luna. This is confirmed by the fact that like produces like. We know that there are only two Stones, the white and the red. There are also two matters of the

Stone, Sol and Luna, formed together in a proper marriage, both natural and artificial. Now, as we see that the man or the woman, without the seed of both, cannot generate, in the same way our man, Sol, and his wife, Luna, cannot conceive or do an thing in the way of generation, without the seed and sperm of both. Hence the philosophers gathered that a third thing was necessary, namely, the animated seed of both, the man and the woman, without which they judged that the whole of their work was fruitless and in vain. Such a sperm is Mercury, which, by the natural conjunction of both bodies Sol and Luna, receives their nature into itself in union. Then at length, and not before, the work is fit for congress, ingress, and generation; by the masculine and feminine power and virtue. Hence the philosophers have said that this same Mercury is composed of body, spirit, and soul, and that it has assumed the nature and property of all elements. Therefore, with their most powerful genius and intellect, they asserted their Stone to be animal. They even called it their Adam, who carries his own invisible Eve hidden in his body, from that moment in which they were united by the power of the Supreme God, the Maker of all creatures. For this reason it may be said that the Mercury of the Philosophers is none other than their most abstruse, compounded Mercury, and not the common Mercury. So then they have wisely said to the sages that there is in Mercury whatever wise men seek. Almadir, the philosopher, says: "We extract our Mercury from one perfect body and two perfect natural conditions incorporated together, which indeed puts forth externally its perfection, whereby it is able to resist the fire, so that its internal imperfection may be protected by the external perfections". By this passage of the sagacious philosopher is understood the Adamic matter, the limbus of the microcosm<sup>16</sup>, and the homogeneous, unique matter of the philosophers. The sayings of these men, which we have before mentioned, are simply golden, and ever to be held in the highest esteem, because they contain nothing superfluous or without force. Summarily, then, the matter of the Philosophers' Stone is none other than a fiery and perfect Mercury extracted by Nature and Art; that is, the artificially prepared and true hermaphrodite Adam, and the microcosm: That wisest of the philosophers, Mercurius, making the same statement, called the Stone an orphan. Our Mercury, therefore, is the same which contains in itself all the perfections, force, and virtues of the Sun, which also runs through all the streets and houses of all the planets, and in its own rebirth has acquired the force of things above and things below; to the marriage of which it is to be compared, as is clear from the whiteness and the redness combined in it.

## CHAPTER XVII.

### CONCERNING THE PREPARATION OF THE MATTER FOR THE PHILOSOPHIC STONE.

What Nature principally requires is that its own philosophic man should be brought into a mercurial substance, so that it may be born into the philosophic Stone. Moreover, it should be remarked that those common preparations of Geber, Albertus Magnus, Thomas Aquinas, Rupescissa, Polydorus, and such men, are nothing more than some particular solutions, sublimations, and calcinations, having no reference to our universal substance, which needs only the most secret fire of the philosophers. Let the fire and Azoth therefore suffice for you. From the fact that the philosophers make mention of certain preparations, such as putrefaction, distillation, sublimation, calcination, coagulation, dealbation, rubification, ceration, fixation, and the like, you should understand that in their universal substance, Nature herself fulfils all the operations in the matter spoken of, and not the operator, only in a philosophical vessel, and with a similar fire, but not common fire. The white and the red spring from one root without any intermediary. It is dissolved by itself, it copulates by itself, grows white, grows red, is made crocus-coloured and black by itself, marries itself and conceives in itself. It is therefore to be decocted, to be baked, to be fused; it ascends, and it descends. All these operations are a single operation and produced by the fire alone. Still, some philosophers, nevertheless, have, by a highly graduated essence of wine, dissolved the body of Sol, and rendered it volatile, so that it should ascend through an alembic, thinking that this is the true volatile matter of the philosophers, though it is not so. And although it be no contemptible arcanum to reduce this perfect metallic body into a volatile, spiritual substance, yet they are wrong in their separation of the elements. This process of the monks, such as Lully, Richard of England, Rupescissa, and the rest, is erroneous. By this process they thought that they were going to separate gold after this fashion into a subtle, spiritual, and elementary power, each by itself, and afterwards by circulation and rectification to combine them again in one – but in vain. For although one element may, in a certain sense, be separated from another, yet, nevertheless, every element separated in this way can again be separated into another element, but these elements cannot afterwards by circulation in a pelican, or by distillation, be again brought back into one; but they always remain a certain volatile matter, and aurum potable, as they themselves call it. The reason why they could not compass their intention is that Nature refuses to be in this way dragged asunder and separated by man's disjunctions, as by earthly glasses and instruments. She alone knows her own operations and the weights of the elements, the separations, rectifications, and copulations of which she brings about without the aid of any operator or manual artifice, provided only the matter be contained in the secret fire and in its proper occult vessel. The separation of the elements, therefore, is impossible by man. It may appear to take place, but it is not true, whatever may be said by Raymond Lully, and of that famous English golden work which he is falsely supposed to have accomplished. Nature herself has within herself the proper separator, who again joins together what he has put asunder, without the aid of man. She knows best the proportion of every element, which man does not know, however misreading writers romance in their frivolous and false recipes about this volatile gold.

This is the opinion of the philosophers, that when they have put their matter into the more secret fire, and when with a moderated philosophical heat it is cherished on every side, beginning to pass into corruption, it grows black. This operation they term putrefaction, and they call the blackness by the name of the Crow's Head. The ascent and descent thereof they term distillation, ascension, and descension. The exsiccation they call coagulation; and the dealbation they call calcination; while because it becomes fluid and soft in the heat they make mention of ceration. When it ceases to ascend and remains liquid at the bottom, they say fixation is present.

In this manner it is the terms of philosophical operations are to be understood, and not otherwise.

## CHAPTER XVIII.

### CONCERNING INSTRUMENTS AND THE PHILOSOPHIC VESSEL.

Sham philosophers have misunderstood the occult and secret philosophic vessel, and worse is that which is said by Aristoteles the Alchemist (not the famous Greek Academic Philosopher), giving it out that the matter is to be decocted in a triple vessel. Worst of all is that which is said by another, namely, that the matter in its first separation and first degree requires a metallic vessel; in its second degree of coagulation and dealbation of its earth a glass vessel; and in the third degree, for fixation, an earthen vessel. Nevertheless, hereby the philosophers understand one vessel alone in all the operations up to the perfection of the red stone. Since, then, our matter is our root for the white and the red, necessarily our vessel must be so fashioned that the matter in it may be governed by the heavenly bodies. For invisible celestial influences and the impressions of the stars are in the very first degree necessary for the work: Otherwise it would be impossible for the Oriental, Chaldean, and Egyptian stone to be realised. By this Anaxagoras knew the powers of the whole firmament, and foretold that a great stone would descend from heaven to earth, which actually happened after his death. To the Cabalists our vessel is perfectly well known, because it must be made according to a truly geometrical proportion and measure, and from a definite quadrature of the circle, so that the spirit and the soul of our matter, separated from their body, may be able to raise this vessel with themselves in proportion to the altitude of heaven. If the vessel be wider, narrower, higher, or lower than is fitting, and than the dominating operating spirit and soul desire, the heat of our secret philosophic fire (which is, indeed, very severe), will violently excite the matter and urge it on to excessive operation, so that the vessel is shivered into a thousand pieces, with imminent danger to the body and even the life of the operator. On the other hand, if it be of greater capacity than is required in due proportion for the heat to have effect on the matter, the work will be wasted and thrown away. So, then, our philosophic vessel must be made with the greatest care. What the material of the vessel should be is understood only by those who, in the first solution of our fixed and perfected matter have brought that matter to its own primal quintessence. Enough has been said on this point.

The operator must also very accurately note what, in its first solution, the matter sends forth and rejects from itself.

The method of describing the form of the vessel is difficult. It should be such as Nature requires, and it must be sought out and investigated from every possible source, so that, from the height of the philosophic heaven, elevated above the philosophic earth, it may be able to operate on the fruit of its own earthly body. It should have this form, too, in order that the separation and purification of the elements, when the fire drives one from the other, may be able to be accomplished, and that each may have power to occupy the place to which it adheres; and also that the sun and the other planets may exercise their operations around the elemental earth, while their course in their circuit is neither hindered nor agitated with too swift a motion. In all these particulars which have been mentioned it must have a proper proportion of rotundity and of height.

The instruments for the first purification of mineral bodies are fusing-vessels, bellows, tongs, capels, cupels, tests, cementatory vessels, cineritiums, cucurbites, bocias for aquafortis and aqua regia; and also the appliances which are required for projection at the climax of the work.

## CHAPTER XIX.

### CONCERNING THE SECRET FIRE OF THE PHILOSOPHERS.

This is a well-known sententious saying of the philosophers, "Let fire and Azoc suffice thee". Fire alone is the whole work and the entire art. Moreover, they who build their fire and keep their vessel in that heat are in error. In vain some have attempted it with the heat of horse dung. By the coal fire, without a medium, they have sublimated their matter, but they have not dissolved it. Others have got their heat from lamps, asserting that this is the secret fire of the philosophers for making their Stone. Some have placed it in a bath, first of all in heaps of ants' eggs; others in juniper ashes. Some have sought the fire in quicklime, in tartar, vitriol, nitre, etc. Others, again, have sought it in boiling water. Thomas Aquinas speaks falsely of this fire, saying that God and the angels cannot do without this fire, but use it daily. What blasphemy is this! Is it not a manifest lie that God is not able to do without the elemental heat of boiling water? All the heats excited by those means which have been mentioned are utterly useless for our work. Take care not to be misled by Arnold de Villa Nova, who has written on the subject of the coal fire, for in this matter he will deceive you.

Almadir says that the invisible rays of our fire of themselves suffice. Another cites, as an illustration, that the heavenly heat by its reflections tends to the coagulation and perfection of Mercury, just as by its continual motion it tends to the generation of metals. Again, says this same authority, "Make a fire, vaporous, digesting, as for cooking, continuous, but not volatile or boiling, enclosed, shut off from the air, not burning, but altering and penetrating. Now, in truth, I have mentioned every mode of fire and of exciting heat. If you are a true philosopher you will understand". This is what he says.

Salmanazar remarks: "Ours is a corrosive fire, which brings over our vessel an air like a cloud, in which cloud the rays of this fire are hidden. If this dew of chaos and this moisture of the cloud fail, a mistake has been committed". Again, Almadir says, that unless the fire has warmed our sun with its moisture, by the excrement of the mountain, with a moderate ascent, we shall not be partakers either of the Red or the White Stone.

All these matters shew quite openly to us the occult fire of the wise men. Finally, this is the matter of our fire, namely, that it be kindled by the quiet spirit of sensible fire, which drives upwards, as it were, the heated chaos from the opposite quarter, and above our philosophic matter. This heat, glowing above our vessel, must urge it to the motion of a perfect generation, temperately but continuously, without intermission.

## CHAPTER XX.

### CONCERNING THE FERMENT OF THE PHILOSOPHERS, AND THE WEIGHT.

Philosophers have laboured greatly in the art of ferments and of fermentations, which seems important above all others. With reference thereto some have made a vow to God and to the philosophers that they would never divulge its arcanum by similitudes or by parables.

Nevertheless, Hermes, the father of all philosophers, in the "Book of the Seven Treatises", most clearly discloses the secret of ferments, saying that they consist only of their own paste; and more at length he says that the ferment whitens the confection, hinders combustion, altogether retards the flux of the tincture, consoles bodies, and amplifies unions. He says, also, that this is the key and the end of the work, concluding that the ferment is nothing but paste, as that of the sun is nothing but sun, and that of the moon nothing but moon. Others affirm that the ferment is the soul, and if this be not rightly prepared from the magistry, it effects nothing. Some zealots of this Art seek the Art in common sulphur, arsenic, tutia, auripigment, vitriol, etc., but in vain; since the substance which is sought is the same as that from which it has to be drawn forth. It should be remarked, therefore, that fermentations of this kind do not succeed according to the wishes of the zealots in the way they desire, but, as is clear from what has been said above, simply in the way of natural successes.

But, to come at length to the weight; this must be noted in two ways. The first is natural, the second artificial. The natural attains its result in the earth by Nature and concordance. Of this, Arnold says: If more or less earth than Nature requires be added, the soul is suffocated, and no result is perceived, nor any fixation. It is the same with the water. If more or less of this be taken it will bring a corresponding loss. A superfluity renders the matter unduly moist, and a deficiency makes it too dry and too hard. If there be over much air present, it is too strongly impressed on the tincture; if there be too little, the body will turn out pallid. In the same way, if the fire be too strong, the matter is burnt up; if it be too slack, it has not the power of drying, nor of dissolving or heating the other elements. In these things elemental heat consists.

Artificial weight is quite occult. It is comprised in the magical art of ponderations. Between the spirit, soul, and body, say the philosophers, weight consists of Sulphur as the director of the work; for the soul strongly desires Sulphur, and necessarily observes it by reason of its weight.

You can understand it thus: Our matter is united to a red fixed Sulphur, to which a third part of the regimen has been entrusted, even to the ultimate degree, so that it may perfect to infinity the operation of the Stone, may remain therewith together with its fire, and may consist of a weight equal to the matter itself, in and through all, without variation of any degree. Therefore, after the matter has been adapted and mixed in its proportionate weight, it should be closely shut up with its seal in the vessel of the philosophers, and committed to the secret fire. In this the Philosophic Sun will rise and surge up, and will illuminate all things that have been looking for his light, expecting it with highest hope.

In these few words we will conclude the arcanum of the Stone, an arcanum which is in no way maimed or defective, for which we give God undying thanks. Now have we opened to you our treasure, which is not to be paid for by the riches of the whole world.

HERE ENDS THE AURORA OF THE PHILOSOPHERS.

## NOTES

1 The work under this title is cited occasionally in other writings of Paracelsus, but is not included in the great folio published at Geneva in 1688. It was first issued at Basle in 1575, and was accompanied with copious annotations in Latin by the editor, Gerard Dorne. This personage was a very persevering collector of the literary remains of Paracelsus, but is not altogether free from the suspicion of having elaborated his original. The Aurora is by some regarded as an instance in point; though no doubt in the main it is a genuine work of the Sage of Hohenheim, yet in some respects it does seem to approximate somewhat closely to previous schools of Alchemy, which can scarcely be regarded as representing the actual standpoint of Paracelsus.

2 He who created man the same also created science. What has man in any place without labour? When the mandate went forth: Thou shalt live by the sweat of thy brow, there was, as it were, a new creation. When God uttered His fiat the world was made. Art, however, was not then made, nor was the light of Nature. But when Adam was expelled from Paradise, God created for him the light of Nature when He bade him live by the work of his hands. In like manner, He created for Eve her special light when He said to her: In sorrow shalt thou bring forth children. Thus, and there, were these beings made human and earthy that were before like angelicals. ... Thus, by the word were creatures made, and by this same word was also made the light which was necessary to man. ... Hence the interior man followed from the second creation, after the expulsion from Paradise. ... Before the Fall, that cognition which was requisite to man had not begun to develop in him. He received it from the angel when he was cast out of Paradise. ... Man was made complete in the order of the body, but not in the order of the arts. – *De Caducis*, Par. III.

3 No work precisely corresponding to this title is extant among the writings of Paracelsus. The subjects to which reference is made are discussed in the *Philosophia Sagax*.

4 Before all things it is necessary to have a right understanding of the nature of Celestial Magic. It originates from divine virtue. There is that magic which Moses practised, and there is the maleficent magic of the sorcerers. There are, then, different kinds of Magi. So also there is what is called the Magic of Nature; there is the Celestial Magus; there is the Magus of Faith, that is, one whose faith makes him whole. There is, lastly, the Magus of Perdition. – *Philosophia Sagax*, Lib. II., c. 6.

5 Learn, therefore, Astronomic Magic, which otherwise I call cabalistic. – *De Pestilitate*, Tract I. This art, formerly called cabalistic, was in the beginning named caballa, and afterwards caballia. It is a species of magic. It was also, but falsely, called Gabanala, by one whose knowledge of the subject was profound. It was of an unknown Ethnic origin, and it passed subsequently to the Chaldaeans and Hebrews, by both of whom it was corrupted. – *Philosophia Sagax*, Lib. I., s. v. *Probatio in Scientiam Nectromantricam*.

6 The object which received the influence and exhibited the sign thereof appears to have been termed Gamaheu, Gamahey etc. But the name was chiefly given to certain stones on which various and wonderful images and figures of men and animals have been found naturally depicted, being no work of man, but the result of the providence and counsel of God. – *De Imaginibus*, c. 7 and c. 13. It is possible, magically, for a man to project his influence into these stones and some other substances. – *Ibid.*, c. 13. But they also have their own inherent virtue, which is indicated by the shape and the special nature of the impression. – *Ibid.*, c. 7. There was also an artificial Gamaheus invented and prepared by the Magi, and this seems to have been more powerful. – *De Carduo Angelico*.

7 Man was regarded by Paracelsus as himself in a special manner the true Quintessence. After God had created all the elements, stars, and every other created thing, and had disposed them according to His will, He proceeded, lastly, to the forming of man. He extracted the essence out of the four elements into one mass; He extracted also the essence of wisdom, art, and reason out of the stars, and this twofold essence He congested into one mass: which mass Scripture calls the slime of the earth. From that mass two bodies were made – the sidereal and the elementary. These, according to the light of Nature, are called the *quintum esse*. The mass was extracted, and therein the firmament and the elements were condensed. What was extracted from the four after this manner constituted a fifth. The Quintessence is the nucleus and the place of the essences and properties of all things in the universal world. All nature came into the hand of God – all potency, all property, all essence of the superior and inferior globe. All these had God joined in His hand, and from these He formed man according to His image. – *Philosophia Sagax*, Lib. I., c. 2.

8 All created things proceed from the coagulated, and after coagulation must go on to resolution. From resolution proceed all procreated things. – *De Tartaro* (fragment). All bodies of minerals are coagulated by salt. – *De Natraralibus Aquis*, Lib. III., Tract 2.

9 So acute is the potency of calcined blood, that if it be poured slowly on iron it produces in the first place a whiteness thereon, and then generates rust. – *Scholia in Libros de Tartaro*. In Lib. II., Tract II.

10 One recipe for the fixation of arsenic is as follows: – Take equal parts of arsenic and nitre. Place these in a tigillum, set upon coals so that they may begin to boil and to evaporate. Continue till ebullition and evaporation cease, and the substances shall have settled to the bottom of the vessel like fat melting in a frying-pan; then, for the space of an hour and a half (the longer the better), set it apart to settle. Subsequently pour the compound upon marble, and it will acquire a gold colour. In a damp place it will assume the consistency of a fatty fluid. – *De Naturalibus Rebus*, c. 9. Again: The fixation of arsenic is performed by salt of urine, after which it is converted by itself into an oil. – *Chirurgia Minor*, Lib. II.

11 Concerning the kinds of arsenic, it is to be noted that there are those which flow forth from their proper mineral or metal, and are called native arsenics. Next there are arsenics out of metals after their kind. Then there are those made by Art through transmutation. White or crystalline arsenic is the best for medicine Yellow and red arsenic are utilised by chemists for investigating the transmutation of metals, in which arsenic has a special efficacy. – *De Naturalibus Rebus*, c. 9.

12 The arcanum of vitriol is the oil of vitriol. Thus: after the aquosity has been removed in coction from vitriol, the spirit is elicited by the application of greater heat. The vitriol then comes over pure in the form of water. This water is combined with the *caput mortuum* left by the process, and on again separating in a *balneum maris*, the phlegmatic part passes off, and the oil, or the arcanum of vitriol, remains at the bottom of the vessel. – *Ibid*.

13 So long as the viridity or greenness of vitriol subsists therein, it is of a soft quality and substance. But if it be excocted so that it is deprived of its moisture, it is thereby changed into a hard stone from which even fire can be struck. When the moisture is evaporated from vitriol, the sulphur which it contains predominates over the salt, and the vitriol turns red. – *De Pestilitate*, Tract I.

14 The diagnosis of vitriol is concerned with it both in Medicine and Alchemy. In Medicine it is a paramount remedy. In Alchemy it has many additional purposes. The Art of Medicine and Alchemy consists in the preparation of vitriol, for it is worthless in its crude state. It is like unto wood, out of which it is possible to carve anything. Three kinds of oil are extracted from vitriol – a red oil, by distillation in a retort after an alchemistic method, and this is the most acid of all substances, and has also a corrosive quality – also a green and a white oil, distilled from crude vitriol by descension. – *De Vitriolo*. Nor let it be regarded as absurd that we assign such great virtues to vitriol, for therein resides, secret and hidden, a certain peculiar golden force, not corporeal but spiritual, which excellent and admirable virtue exists in greater potency and certainty therein than it does in gold. When this golden spirit of vitriol is volatilized and separated from its impurities, so that the essence alone remains, it is like unto potable gold. – *De Morbis Amentium, Methodus II.*, c. 1.

15 Antimony can be made into a pap with the water of vitriol, and then purified by sal ammoniac, and in this manner there may be obtained from it a thick purple or reddish liquor. This is oil of antimony, and it has many virtues. – *Chirurgia Magna*, Lib. V. Take three pounds of antimony and as much of sal gemmae. Distil them together in a retort for three natural days, and so you will have a red oil, which has incredible healing power in cases of otherwise incurable wounds. – *Chirurgia Minor*, Tract II., c. 11.

16 Man himself was created from that which is termed limbus. This limbus contained the potency and nature of all creatures. Hence man himself is called the microcosmus, or world in miniature. – *De Generatione Stultorum*. Man was fashioned out of the limbus, and this limbus is the universal world. – *Paramirum Aliud*, Lib. II., c. 2. The limbus was the first matter of man. ... Whosoever knows the limbus knows also what man is. Whatsoever the limbus is, that also is man. – *Paramirum Aliud*, Lib. IV. There is a dual limbus, man, the lesser limbus, and that Great Limbus from which he was produced. – *De Podagra, s. v. de Limbo*. The limbus is the seed out of which all creatures are produced and grow, as the tree comes forth from its own special seed. The limbus has its ground in the word of God. – *Ibid.* The limbus of Adam was heaven and earth, water and air. Therefore, man also remains in the limbus, and contains in himself heaven and earth, air and water, and these things he also himself is. – *Paragranum Alterum*, Tract II.

# The Book Concerning The Tincture Of The Philosophers by Paracelsus

---

THE BOOK CONCERNING THE TINCTURE OF THE PHILOSOPHERS

WRITTEN AGAINST THOSE SOPHISTS BORN SINCE THE DELUGE,  
IN THE AGE OF OUR LORD JESUS CHRIST, THE SON OF GOD;

By PH. THEOPHRASTUS BOMBAST, of HOHENHEIM,

Philosopher of the Monarchia, Prince of Spagyrist, Chief Astronomer,  
Surpassing Physician, and Trismegistus of Mechanical Arcana.

## PREFACE.

SINCE you, O Sophist, everywhere abuse me with such fatuous and mendacious words, on the ground that being sprung from rude Helvetia I can understand and know nothing: and also because being a duly qualified physician I still wander from one district to another; therefore I have proposed by means of this treatise to disclose to the ignorant and inexperienced: what good arts existed in the first age; what my art avails against you and yours against me; what should be thought of each, and how my posterity in this age of grace will imitate me. Look at Hermes, Archelaus, and others in the first age: see what Spagyrist and what Philosopher then existed. By this they testify that their enemies, who are your patrons, O Sophist, at the present time are but mere empty forms and idols. Although this would not be attested by those who are falsely considered your authentic fathers and saints, yet the ancient Emerald Table shews more art and experience in Philosophy, Alchemy, Magic, and the like, than could ever be taught by you and your crowd of followers. If you do not yet understand, from the aforesaid facts, what and how great treasures these are, tell me why no prince or king was ever able to subdue the Egyptians. Then tell me why the Emperor Diocletian ordered all the Spagyric books to be burnt (so far as he could lay his hands upon them). Unless the contents of those books had been known, they would have been obliged to bear still his intolerable yoke, - a yoke, O Sophist, which shall one day be put upon the neck of yourself and your colleagues.

From the middle of this age the Monarchy of all the Arts has been at length derived and conferred on me, Theophrastus Paracelsus, Prince of Philosophy and of Medicine. For this purpose I have been chosen by God to extinguish and blot out all the phantasies of elaborate and false works, of delusive and presumptuous words, be they the words of Aristotle, Galen, Avicenna, Mesva, or the dogmas of any among their followers. My theory, proceeding as it does from the light of Nature, can never, through its consistency, pass away or be changed: but in the fifty-eighth year after its millennium and a half it will then begin to flourish. The practice at the same time following upon the theory will be proved by wonderful and incredible signs, so as to be open to mechanics and common people, and they will thoroughly understand how firm and immovable is that Paracelsic Art against the triflings of the Sophists: though meanwhile that sophistical science has to have its ineptitude propped up and fortified

by papal and imperial privileges. In that I am esteemed by you a mendicant and vagabond sophist, the Danube and the Rhine will answer that accusation, though I hold my tongue. Those calumnies of yours falsely devised against me have often displeased many courts and princes, many imperial cities, the knightly order, and the nobility. I have a treasure hidden in a certain city called Weinden, belonging to Forum Julii, at an inn, - a treasure which neither you, Leo of Rome, nor you, Charles the German, could purchase with all your substance. Although the signed star has been applied to the arcanum of your names, it is known to none but the sons of the divine Spagyric Art. So then, you wormy and lousy Sophist, since you deem the monarch of arcana a mere ignorant, fatuous, and prodigal quack, now, in this mid age, I determine in my present treatise to disclose the honourable course of procedure in these matters, the virtues and preparation of the celebrated Tincture of the Philosophers for the use and honour of all who love the truth, and in order that all who despise the true arts may be reduced to poverty. By this arcanum the last age shall be illuminated clearly and compensated for all its losses by the gift of grace and the reward of the spirit of truth, so that since the beginning of the world no similar germination of the intelligence and of wisdom shall ever have been heard of. In the meantime, vice will not be able to suppress the good, nor will the resources of those vicious persons, many though they be, cause any loss to the upright.

## THE BOOK CONCERNING THE TINCTURE OF THE PHILOSOPHERS.

### CHAPTER I.

I, PHILIPPUS Theophrastus Paracelsus Bombast, say that, by Divine grace, many ways have been sought to the Tincture of the Philosophers, which finally all came to the same scope and end. Hermes Trismegistus, the Egyptian, approached this task in his own method. Orus, the Greek, observed the same process. Hali, the Arabian, remained firm in his order. But Albertus Magnus, the German, followed also a lengthy process. Each one of these advanced in proportion to his own method; nevertheless, they all arrive at one and the same end, at a long life, so much desired by the philosophers, and also at an honourable sustenance and means of preserving that life in this Valley of Misery. Now at this time, I, Theophrastus Paracelsus Bombast, Monarch of the Arcana, am endowed by God with special gifts for this end, that every searcher after this supreme philosophic work may be forced to imitate and to follow me, be he Italian, Pole, Gaul, German, or whatsoever or whosoever he be. Come hither after me, all you philosophers, astronomers, and spagyrist, of however lofty a name ye may be, I will show and open to you, Alchemists and Doctors, who are exalted by me with the most consummate labours, this corporeal regeneration. I will teach you the tincture, the arcanum<sup>1</sup>, the quintessence, wherein lie hid the foundations of all mysteries and of all works. For every person may and ought to believe in another only in those matters, which he has tried by fire. If any one shall have brought forward anything contrary to this method of experimentation in the Spagyric Art or in Medicine, there is no reason for your belief in him, since, experimentally, through the agency of fire, the true is separated from the false. The light of Nature indeed is created in this way, that by means thereof the proof or trial of everything may appear, but only to those who walk in this light. With this light we will teach, by the very best methods of demonstration, that all those who before me have approached this so difficult province with their own fancies and acute speculations have, to their own loss, incurred the danger of their foolishness. On which account, from my standpoint,

many rustics have been ennobled; but, on the other hand, through the speculative and opinionative art of these many nobles have been changed into clowns, and since they carried golden mountains in their head before they had put their hand to the fire. First of all, then, there must be learnt - digestions, distillations, sublimations, reverberations, extractions, solutions, coagulations, fermentations, fixations, and every instrument which is requisite for this work must be mastered by experience, such as glass vessels, cucurbites, circulators, vessels of Hermes, earthen vessels, baths, blast-furnaces, reverberatories, and instruments of like kind, also marble, coals, and tongs. Thus at length you will be able to profit in Alchemy and in Medicine.

But so long as, relying on fancy and opinion, you cleave to your fictitious books, you are fitted and predestinated for no one of these things.

## CHAPTER II.

### CONCERNING THE DEFINITION OF THE SUBJECT AND MATTER OF THE TINCTURE OF THE PHILOSOPHERS.

Before I come, then, to the process of the Tincture, it is needful that I open to you the subject thereof: for, up to the present time, this has always been kept in a specially occult way by the lovers of truth. So, then, the matter of the Tincture (when you understand me in a Spagyric sense) is a certain thing which, by the art of Vulcan<sup>2</sup>, passes out of three essences into one essence, or it may remain. But, that I may give it its proper name, according to the use of the ancients, though it is called by many the Red Lion, still it is known by few. This, by the aid of Nature and the skill of the Artist himself, can be transmuted into a White Eagle, so that out of one two are produced; and beyond this the brightness of gold does not shine so much for the Spagyrist as do these two when kept in one. Now, if you do not understand the use of the Cabalists and the old astronomers, you are not born by God for the Spagyric art, or chosen by Nature for the work of Vulcan, or created to open your mouth concerning Alchemical Arts. The matter of the Tincture, then, is a very great pearl and a most precious treasure, and the noblest thing next to the manifestation of the Most High and the consideration of men which can exist upon earth. This is the Lili of Alchemy and of Medicine, which the philosophers have so diligently sought after, but, through the failure of entire knowledge and complete preparation, they have not progressed to the perfect end thereof. By means of their investigations and experiments, only the initial stage of the Tincture has been given to us; but the true foundation, which my colleagues must imitate, has been left for me, so that no one should mingle their shadows with our good intentions. I, by right after my long experiences, correct the Spagyrists, and separate the false or the erroneous from the true, since, by long investigations, I have found reasons why I should be able justly to blame and to change diverse things. If, indeed, I had found out experiments of the ancients better than my own, I should scarcely have taken up such great labours as, for the sake, the utility, and the advantage of all good Alchemists, I have undergone willingly. Since, then, the subject of the Tincture has been sufficiently declared, so that it scarcely could or ought to be exceeded in fidelity between two brothers, I approach its preparation, and after I have laid down the experiences of the first age, I wish to add my own inventions; to which at last the Age of Grace will by-and-by give its adhesion, whichever of the patriarchs, O Sophist, you, in the meantime, shall have made leaders.

### CHAPTER III.

#### CONCERNING THE PROCESS OF THE ANCIENTS FOR THE TINCTURE OF THE PHILOSOPHERS, AND A MORE COMPENDIOUS METHOD BY PARACELSUS.

The old Spagyrist putrefied Lili for a philosophical month, and afterwards distilled therefrom the moist spirits, until at length the dry spirits were elevated. They again imbued the caput mortuum with moist spirits, and drew them off from it frequently by distillation until the dry spirits were all elevated. Then afterwards they united the moisture that had been drawn off and the dry spirits by means of a pelican, three or four times, until the whole Lili remained dry at the bottom. Although early experience gave this process before fixation, none the less our ancestors often attained a perfect realisation of their wish by this method. They would, however, have had a shorter way of arriving at the treasure of the Red Lion if they had learnt the agreement of Astronomy with Alchemy, as I have demonstrated it in the Apocalypse of Hermes<sup>3</sup>. But since every day (as Christ says for the consolation of the faithful) has its own peculiar care, the labour for the Spagyrist before my times has been great and heavy; but this, by the help of the Holy Spirit flowing into us, will, in this last age, be lightened and made clear by my theory and practice, for all those who constantly persevere in their work with patience. For I have tested the properties of Nature, its essences and conditions, and I know its conjunction and resolution, which are the highest and greatest gift for a philosopher, and never understood by the sophists up to this time. When, therefore, the earliest age gave the first experience of the Tincture, the Spagyrist made two things out of one simple. But when afterwards, in the Middle Age, this invention had died out, their successors by diligent scrutiny afterwards came upon the two names of this simple, and they named it with one word, namely, Lili, as being the subject of the Tincture. At length the imitators of Nature putrefied this matter at its proper period just like the seed in the earth, since before this corruption nothing could be born from it, nor any arcanum break forth from it. Afterwards they drew off the moist spirits from the matter, until at length, by the violence of the fire, the dry were also equally sublimated, so that, in this way, just as the rustic does at the proper time of year, they might come to maturity as one after another is wont to ascend and to fall away. Lastly, as after the spring comes summer, they incorporated those fruits and dry spirits, and brought the Magistry of the Tincture to such a point that it came to the harvest, and laid itself out for ripening.

### CHAPTER IV.

#### CONCERNING THE PROCESS FOR THE TINCTURE OF THE PHILOSOPHERS, AS IT IS SHORTENED BY PARACELSUS.

The ancient Spagyrist would not have required such lengthened labour and such wearisome repetition if they had learnt and practised their work in my school. They would have obtained their wish just as well, with far less expense and labour. But at this time, when Theophrastus Paracelsus has arrived as the Monarch of Arcana, the opportunity is at hand for finding out those things which were occult to all Spagyrist before me. Wherefore I say, Take only the rose-coloured blood from the Lion and the gluten from the Eagle. When you have mixed these, coagulate them according to the old process, and you will have the Tincture of the Philosophers, which an infinite

number have sought after and very few have found. Whether you will or not, sophist, this Magistry is in Nature itself, a wonderful thing of God above Nature, and a most precious treasure in this Valley of Sorrows. If you look at it from without it seems a paltry thing to transmute another into something far more noble than it was before. But you must, nevertheless, allow this, and confess that it is a miracle produced by the Spagyrist, who by the art of his preparation corrupts a visible body which is externally vile, from which he excites another most noble and most precious essence. If you, in like manner, have learnt anything from the light of Aristotle, or from us, or from the rules of Serapio, come forth, and bring that knowledge experimentally to light. Preserve now the right of the Schools, as becomes a lover of honour and a doctor. But if you know nothing and can do nothing, why do you despise me as though I were an irrational Helvetian cow, and inveigh against me as a wandering vagabond? Art is a second Nature and a universe of its own, as experience witnesses, and demonstrates against you and your idols. Sometimes, therefore, the Alchemist compounds certain simples, which he afterwards corrupts according to his need, and prepares thence another thing. For thus very often out of many things one is made, which effects more than Nature of herself can do, as in Gastaynum it is perfectly well known that Venus is produced from Saturn; in Carinthia, Luna out of Venus; and in Hungary, Sol out of Luna; to pass over in silence for the time being the transmutations of other natural objects, which were well known to the Magi, and more wonderfully than Ovid narrates in his Metamorphoses do they come to the light. That you may rightly understand me, seek your Lion in the East, and your Eagle in the South, for this our work which has been undertaken. You will not find better instruments than Hungary and Istria produce. But if you desire to lead from unity by duality in trinity with equal permutation of each, then you should direct your journey to the South; so in Cyprus shall you gain all your desire, concerning which we must not dilate more profusely than we have done at present. There are still many more of these arcana which exhibit transmutations, though they are known to few. And although these may by the Lord God be made manifest to anyone, still, the rumour of this Art does not on that account at once break forth, but the Almighty gives therewith the understanding how to conceal these and other like arts even to the coming of Elias the Artist, at which time there shall be nothing so occult that it shall not be revealed. You also see with your eyes (though there is no need to speak of these things, which may be taken derisively by some) that in the fire of Sulphur is a great tincture for gems, which, indeed, exalts them to a loftier degree than Nature by herself could do. But this gradation of metals and gems shall be omitted by me in this place, since I have written sufficiently about it in my Secret of Secrets, in my book on the Vexations of Alchemists, and abundantly elsewhere. As I have begun the process of our ancestors with the Tincture of the Philosophers, I will now perfectly conclude it.

## CHAPTER V.

### CONCERNING THE CONCLUSION OF THE PROCESS OF THE ANCIENTS, MADE BY PARACELSUS.

Lastly, the ancient Spagyrists having placed Lili in a pelican and dried it, fixed it by means of a regulated increase of the fire, continued so long until from blackness, by permutation into all the colours, it became red as blood, and therewith assumed the condition of a salamander. Rightly, indeed, did they proceed with such labour, and in the same way it is right and becoming that everyone should proceed who seeks this pearl. It will be very difficult for me to make this clearer to you unless you shall have

learnt in the School of the Alchemists to observe the degrees of the fire, and also to change your vessels. For then at length you will see that soon after your Lili shall have become heated in the Philosophic Egg, it becomes, with wonderful appearances, blacker than the crow; afterwards, in succession of time, whiter than the swan; and at last, passing through a yellow colour, it turns out more red than any blood. Seek, seek, says the first Spagyrist, and you shall find; knock, and it shall be opened unto you. It would be impious and indecorous to put food in the mouth of a perfidious bird. Let her rather fly to it, even as I, with others before me, have been compelled to do. But follow true Art; for this will lead you to its perfect knowledge. It is not possible that anything should here be set down more fully or more clearly than I have before spoken. Let your Pharisaical schools teach you what they will from their unstable and slippery foundation, which reaches not its end or its aim. When at length you shall have been taught as accurately as possible the Alchemistic Art, nothing in the nature of things shall then at length be so difficult which cannot be made manifest to you by the aid of this Art. Nature, indeed, herself does not bring forth anything into the light which is advanced to its highest perfection, as can be seen in this place from the unity, or the union, of our duality. But a man ought by Spagyric preparations to lead it thither where it was ordained by Nature. Let this have been sufficiently said by me, concerning the process of the ancients and my correction of the Tincture of the Philosophers, so far as relates to its preparation.

Moreover, since now we have that treasure of the Egyptians in our hands, it remains that we turn it to our use: and this is offered to us by the Spagyric Magistry in two ways. According to the former mode it can be applied for the renewing of the body; according to the latter it is to be used for the transmutation of metals. Since, then, I, Theophrastus Paracelsus, have tried each of them in different ways, I am willing to put them forward and to describe them according to the signs indeed of the work, and as in experience and proof they appeared to me better and more perfectly.

## CHAPTER VI.

### CONCERNING THE TRANSMUTATION OF METALS BY THE PERFECTION OF MEDICINE.

If the Tincture of the Philosophers is to be used for transmutation, a pound of it must be projected on a thousand pounds of melted Sol. Then, at length, will a Medicine have been prepared for transmuted the leprous moisture of the metals. This work is a wonderful one in the light of Nature, namely, that by the Magistry, or the operation of the Spagyrist, a metal, which formerly existed, should perish, and another be produced. This fact has rendered that same Aristotle, with his ill-founded philosophy, fatuous. For truly, when the rustics in Hungary cast iron at the proper season into a certain fountain, commonly called Zifferbrunnen, it is consumed into rust, and when this is liquefied with a blast-fire, it soon exists as pure Venus, and never more returns to iron. Similarly, in the mountain commonly called Kuttentberg, they obtain a lixivium out of marcasites, in which iron is forthwith turned into Venus of a high grade, and more malleable than the other produced by Nature. These things, and more like them, are known to simple men rather than to sophists, namely, those which turn one appearance of a metal into another. And these things, moreover, through the remarkable contempt of the ignorant, and partly, too, on account of the just envy of the artificers, remain almost hidden. But I myself, in Istria, have often brought Venus

to more than twenty-four (al. 38) degrees, so that the colour of Sol could not mount higher, consisting of Antimony or or Quartal, which Venus I used in all respects as other kinds.

But though the old artists were very desirous of this arcanum, and sought it with the greatest diligence, nevertheless, very few could bring it by means of a perfect preparation to its end. For the transmutation of an inferior metal into a superior one brings with it many difficulties and obstacles, as the change of Jove into Luna, or Venus into Sol. Perhaps on account of their sins God willed that the Magnalia of Nature should be hidden from many men. For sometimes, when this Tincture has been prepared by artists, and they were not able to reduce their projection to work its effects, it happened that, by their carelessness and bad guardianship, this was eaten up by fowls, whose feathers thereupon fell off, and, as I myself have seen, grew again. In this way transmutation, through its abuse from the carelessness of the artists, came into Medicine and Alchemy. For when they were unable to use the Tincture according to their desire, they converted the same to the renovation of men, as shall be heard more at large in the following chapter.

## CHAPTER VII.

### CONCERNING THE RENOVATION OF MEN.

Some of the first and primitive philosophers of Egypt have lived by means of this Tincture for a hundred and fifty years. The life of many, too, has been extended and prolonged to several centuries, as is most clearly shewn in different histories, though it seems scarcely credible to any one. For its power is so remarkable that it extends the life of the body beyond what is possible to its congenital nature, and keeps it so firmly in that condition that it lives on in safety from all infirmities. And although, indeed, the body at length comes to old age, nevertheless, it still appears as though it were established in its primal youth.

So, then, the Tincture of the Philosophers is a Universal Medicine, and consumes all diseases, by whatsoever name they are called, just like an invisible fire. The dose is very small, but its effect is most powerful. By means thereof I have cured the leprosy, venereal disease, dropsy, the falling sickness, colic, scab, and similar afflictions; also lupus, cancer, noli-me-tangere, fistulas, and the whole race of internal diseases, more surely than one could believe. Of this fact Germany, France, Italy, Poland, Bohemia, etc., will afford the most ample evidence.

Now, Sophist, look at Theophrastus Paracelsus. How can your Apollo, Machaon, and Hippocrates stand against me? This is the Catholicum of the Philosophers, by which all these philosophers have attained long life for resisting diseases, and they have attained this end entirely and most effectually, and so, according to their judgment, they named it The Tincture of the Philosophers. For what can there be in the whole range of medicine greater than such purgation of the body, by means whereof all superfluity is radically removed from it and transmuted? For when the seed is once made sound all else is perfected. What avails the ill-founded purgation of the sophists since it removes nothing as it ought? This, therefore, is the most excellent foundation of a true physician, the regeneration of the nature, and the restoration of youth. After this, the new essence itself drives out all that is opposed to it. To effect this

regeneration, the powers and virtues of the Tincture of the Philosophers were miraculously discovered, and up to this time have been used in secret and kept concealed by true Spagyrist.

## HERE ENDS THE BOOK CONCERNING THE TINCTURE OF THE PHILOSOPHERS.

---

### NOTES

1 The Arcanum of a substance is not the virtue (*virtus*) but the essence (*vir*) and the potency (*potentia*), and is stronger than the virtue; nevertheless, an old error of the doctors conferred the name of virtues upon the potential essences. - *Paramirum*, Lib. IV. Many things are elsewhere set forth concerning the Quintessence, but what is described is really a separation or extraction of the pure from the impure, not a true quintessence, and it is more correctly termed an Arcanum. - *Explicatio Totius Astronomiae*.

2 The office of Vulcan is the separation of the good from the bad. So the Art of Vulcan, which is Alchemy, is like unto death, by which the eternal and the temporal are divided one from another. So also this art might be called the death of things. - *De Morbis Metallicis*, Lib. I., Tract III., c. 1. Vulcan is an astral and not a corporal fabricator. - *De Caduco Matricis*, Par. VI. The artist working in metals and other minerals transforms them into other colours, and in so doing his operation is like that of the heaven itself. For as the artist excocts by means of Vulcan, or the igneous element, so heaven performs the work of coction through the Sun. The Sun, therefore, is the Vulcan of heaven accomplishing coction in the earth. - *De Icteritiis*. Vulcan is the fabricator and architect of all things, nor is his habitation in heaven only, that is, in the firmament, but equally in all the other elements. - *Lib. Meteorum*, c. 4. Where the three prime principles are wanting, there also the igneous essence is absent. The Igneous Vulcan is nothing else but Sulphur, Sal Nitrum, and Mercury. - *Ibid.*, c.5.

3 The Book of the Revelation of Hermes, interpreted by Theophrastus Paracelsus, concerning the Supreme Secret of the World, seems to have been first brought to light by Benedictus Figulus, and appeared as a *piece de r sistance* in his "Golden and Blessed Casket of Nature's Marvels", of which an English translation has been very recently published. ("A Golden and Blessed Casket of Nature's Marvels". By Benedictus Figulus. Now first done into English from the German original published at Frankfort in the year 1608. London: James Elliott and Co. 8vo., 1893). Among the many writings which have been fabulously attributed to Hermes, there does not seem to be any record of an apocalypse, and it is impossible to say what forged document may have been the subject of interpretation by Paracelsus. As the collection of Figulus is now so readily accessible, it is somewhat superfluous to reproduce the treatise here, but since this translation claims to include everything written by the physician of Hohenheim on the subject of Alchemy and the Universal Medicine, it is appended at this point. It should be premised that Benedictus Figulus complains bitterly of the mutilation and perversion to which the works of Paracelsus were subjected, and the Revelation of Hermes seems in many parts to betray another hand, especially in its quotation of authorities who are not countenanced by its reputed author. Hermes, Plato, Aristotle, and other philosophers, flourishing at different times, who have introduced the Arts, and more especially have explored the secrets of inferior Creation, all these have eagerly sought a means whereby man's body might be preserved from decay and become endued with immortality. To them it was answered that there is nothing which might deliver the mortal body from death; but that there is One Thing which may postpone decay, renew youth; and prolong short human life (as with the patriarchs). For death was laid as a punishment upon our first parents, Adam and Eve, and will never depart from all their descendants. Therefore, the above philosophers, and many others, have sought this One Thing with great labour, and have found that that which preserves the human body from corruption, and prolongs life, conducts itself, with respect to other elements, as it were like the Heavens; from which they understood that the Heavens are a substance above the Four Elements. And just as the Heavens, with respect to the other elements, are held to be the fifth substance (for they are indestructible, stable, and suffer no foreign admixture), so also this One Thing (compared to the forces of our body) is an indestructible essence, drying up all the superfluities of our bodies, and has been philosophically called by the above-mentioned name. It is neither hot and dry like fire, nor cold and moist like water, nor warm and moist like air, nor dry and cold like earth. But it is a skilful, perfect equation of all the Elements, a right commingling of natural forces, a most particular union of spiritual virtues, an indissoluble uniting of body and soul. It is the purest and noblest substance of an indestructible body, which cannot be destroyed nor harmed by the Elements, and is

produced by Art. With this, Aristotle prepared an apple, prolonging life by its scent, when he, fifteen days before his death, could neither eat nor drink on account of old age. This spiritual Essence, or One Thing, was revealed from above to Adam, and was greatly desired by the Holy Fathers; this also Hermes and Aristotle call the Truth without Lies, the most sure of all things certain, the Secret of all Secrets. It is the Last and the Highest Thing to be sought under the Heavens, a wondrous closing and finish of philosophical work, by which are discovered the dews of Heaven and the fastnesses of Earth. What the mouth of man cannot utter is all found in this spirit. As Morienus says: "He who has this has all things, and wants no other aid. For in it are all temporal happiness, bodily health, and earthly fortune. It is the spirit of the fifth substance, a Fount of all Joys ( beneath the rays of the moon), the Supporter of Heaven and Earth, the Mover of Sea and Wind, the Outpurer of Rain, upholding the strength of all things, an excellent spirit above Heavenly and other spirits, giving Health, Joy, Peace, Love; driving away Hatred and Sorrow, bringing in Joy, expelling all Evil, quickly healing all Diseases, destroying Poverty and misery, leading to all good things, preventing all evil words and thoughts, giving man his heart's desire, bringing to the pious earthly honour and long life, but to the wicked who misuse it, Eternal Punishment". This is the Spirit of Truth, which the world cannot comprehend without the interposition of the Holy Ghost, or without the instruction of those who know it. The same is of a mysterious nature, wondrous strength, boundless power. The Saints, from the beginning of the world, have desired to behold its face. By Avicenna this Spirit is named the Soul of the World. For, as the Soul moves all the limbs of the body, so also does this Spirit move all bodies. And as the Soul is in all the limbs of the Body, so also is this Spirit in all elementary created things. It is sought by many and found by few. It is beheld from afar and found near; for it exists in every thing, in every place, and at all times. It has the powers of all creatures; its action is found in all elements, and the qualities of all things are therein, even in the highest perfection. By virtue of this essence did Adam and the Patriarchs preserve their health and live to an extreme age, some of them also flourishing in great riches. When the philosophers had discovered it, with great diligence and labour, they straightway concealed it under a strange tongue, and in parables, lest the same should become known to the unworthy, and the pearls be cast before swine. For if everyone knew it, all work and industry would cease; man would desire nothing but this one thing, people would live wickedly, and the world be ruined, seeing that they would provoke God by reason of their avarice and superfluity. For eye hath not seen, nor ear heard, nor hath the heart of man understood what Heaven hath naturally incorporated with this Spirit. Therefore have I briefly enumerated some of the qualities of this Spirit, to the Honour of God, that the pious may reverently praise Him in His gifts (which gift of God shall afterwards come to them), and I will herewith shew what powers and virtues it possesses in each thing, also its outward appearance, that it may be more readily recognised. In its first state, it appears as an impure earthly body, full of imperfections. It then has an earthly nature, healing all sickness and wounds in the bowels of man, producing good and consuming proud flesh, expelling all stench, and healing generally, inwardly and outwardly. In its second nature, it appears as a watery body, somewhat more beautiful than before, because (although still having its corruptions) its Virtue is greater. It is much nearer the truth, and more effective in works. In this form it cures cold and hot fevers and is a specific against poisons, which it drives from heart and lungs, healing the same when injured or wounded, purifying the blood, and, taken three times a day, is of great comfort in all diseases. But in its third nature it appears as an aerial body, of an oily nature, almost freed from all imperfections, in which form it does many wondrous works, producing beauty and strength of body, and (a small quantity being taken in the food) preventing melancholy and heating of the gall, increasing the quantity of the blood and seed, so that frequent bleeding becomes necessary. It expands the blood vessels, cures withered limbs, restores strength to the sight, in growing persons removes what is superfluous and makes good defects in the limbs. In its fourth nature it appears in a fiery form (not quite freed from all imperfections, still somewhat watery and not dried enough), wherein it has many virtues, making the old young and reviving those at the point of death. For if to such an one there be given, in wine, a barleycorn's weight of this fire, so that it reach the stomach, it goes to his heart, renewing him at once, driving away all previous moisture and poison, and restoring the natural heat of the liver. Given in small doses to old people, it removes the diseases of age, giving the old young hearts and bodies. Hence it is called the Elixir of Life. In its fifth and last nature, it appears in a glorified and illuminated form, without defects, shining like gold and silver, wherein it possesses all previous powers and virtues in a higher and more wondrous degree. Here its natural works are taken for miracles. When applied to the roots of dead trees they revive, bringing forth leaves and fruit. A lamp, the oil of which is mingled with this spirit, continues to burn for ever without diminution. It converts crystals into the most precious stones of all colours, equal to those from the mines, and does many other incredible wonders which may not be revealed to the unworthy. For it heals all dead and living bodies without other medicine. Here Christ is my witness that I lie not, for all heavenly influences are united and combined therein. This essence also

reveals all treasures in earth and sea, converts all metallic bodies into gold, and there is nothing like unto it under Heaven. This spirit is the secret hidden from the beginning, yet granted by God to a few holy men for the revealing of these riches to His Glory - dwelling in fiery form in the air, and leading earth with itself to heaven, while from its body there flow whole rivers of living water. This spirit flies through the midst of the Heavens like a morning mist, leads its burning fire into the water, and has its shining realm in the heavens. And although these writings may be regarded as false by the reader, yet to the initiated they are true and possible, when the hidden sense is properly understood. For God is wonderful in His works, and His wisdom is without end. This spirit in its fiery form is called a Sandaraca, in the aerial a Kybrick, in the watery an Azoth, in the earthly Alcohol and Aliocosoph. Hence they are deceived by these names who, seeking without instruction, think to find this Spirit of Life in things foreign to our Art. For although this spirit which we seek, on account of its qualities, is called by these names, yet the same is not in these bodies and cannot be in them. For a refined spirit cannot appear except in a body suitable to its nature. And, by however many names it be called, let no one imagine there be different spirits, for, say what one will, there is but one spirit working everywhere and in all things. That is the spirit which, when rising, illumines the Heavens, when setting incorporates the purity of Earth, and when brooding has embraced the Waters. This spirit is named Raphael, the Angel of God, the subtlest and purest, whom the others all obey as their King. This spiritual substance is neither heavenly nor hellish, but an airy, pure, and hearty body, midway between the highest and lowest, without reason, but fruitful in works, and the most select and beautiful of all other heavenly things. This work of God is far too deep for understanding, for it is the last, greatest, and highest secret of Nature. It is the Spirit of God, which in the Beginning filled the earth and brooded over the waters, which the world cannot grasp without the gracious interposition of the Holy Spirit and instruction from those who know it, which also the whole world desires for its virtue, and which cannot be prized enough. For it reaches to the planets, raises the clouds, drives away mists, gives its light to all things, turns everything into Sun and Moon, bestows all health and abundance of treasure, cleanses the leper, brightens the eyes, banishes sorrow, heals the sick, reveals all hidden treasures, and, generally, cures all diseases. Through this spirit have the philosophers invented the Seven Liberal Arts, and thereby gained their riches. Through the same Moses made the golden vessels in the Ark, and King Solomon did many beautiful works to the honour of God. Therewith Moses built the Tabernacle, Noah the Ark, Solomon the Temple. By this, Ezra restored the Law, and Miriam, Moses' sister, was hospitable; Abraham, Isaac, and Jacob, and other righteous men, have had lifelong abundance and riches; and all the saints possessing it have therewith praised God. Therefore is its acquisition very hard, more than that of gold and silver. For it is the best of all things, because, of all things mortal that man can desire in this world, nothing can compare with it, and in it alone is truth. Hence it is called the Stone and Spirit of Truth; in its works is no vanity, its praise cannot be sufficiently expressed. I am unable to speak enough of its virtues, because its good qualities and powers are beyond human thoughts, unutterable by the tongue of man, and in it are found the properties of all things. Yea, there is nothing deeper in Nature. O unfathomable abyss of God's Wisdom, which thus hath united and comprised in the virtue and power of this One Spirit the qualities of all existing bodies! O unspeakable honour and boundless joy granted to mortal man! For the destructible things of Nature are restored by virtue of the said Spirit. O mystery of mysteries, most secret of all secret things, and healing and medicine of all things! Thou last discovery in earthly natures, last best gift to Patriarchs and Sages, greatly desired by the whole world! Oh, what a wondrous and laudable spirit is purity, in which stand all joy, riches, fruitfulness of life, and art of all arts, a power which to its initiates grants all material joys! O desirable knowledge, lovely above all things beneath the circle of the Moon, by which Nature is strengthened, and heart and limbs are renewed, blooming youth is preserved, old age driven away, weakness destroyed, beauty in its perfection preserved, and abundance ensured in all things pleasing to men! O thou spiritual substance, lovely above all things! O thou wondrous power, strengthening all the world! O thou invincible virtue, highest of all that is, although despised by the ignorant, yet held by the wise in great praise, honour, and glory, that - proceeding from humours - wakest the dead, expellest diseases, restorest the voice of the dying! O thou treasure of treasures, mystery of mysteries, called by Avicenna "an unspeakable substance", the purest and most perfect soul of the world, than which there is nothing more costly under Heaven, unfathomable in nature and power, wonderful in virtue and works, having no equal among creatures, possessing the virtues of all bodies under Heaven! For from it flow the water of life, the oil and honey of eternal healing, and thus hath it nourished them with honey and water from the rock. Therefore, saith Morienus: "He who hath it, the same also hath all things". Blessed art Thou, Lord God of our Fathers, in that Thou hast given the prophets this knowledge and understanding, that they have hidden these things (lest they should be discovered by the blind, and those drowned in worldly godlessness) by which the wise and the pious have praised Thee! For the discoverers of the mystery of this thing to the unworthy are breakers of the seal of Heavenly Revelation, thereby offending God's

Majesty, and bringing upon themselves many misfortunes and the punishments of God. Therefore, I beg all Christians, possessing this knowledge, to communicate the same to nobody, except it be to one living in Godliness, of well-proved virtue, and praising God, Who has given such a treasure to man. For many seek, but few find it. Hence the impure and those living in vice are unworthy of it. Therefore is this Art to be shewn to all God-fearing persons, because it cannot be bought with a price. I testify before God that I lie not, although it appear impossible to fools, that no one has hitherto explored Nature so deeply. The Almighty be praised for having created this Art and for revealing it to God-fearing men. Amen. And thus is fulfilled this precious and excellent work, called the revealing of the occult spirit, in which lie hidden the secrets and mysteries of the world. But this spirit is one genius, and divine, wonderful, and lordly power. For it embraces the whole world, and overcomes the Elements and the fifth Substance. To our Trismegistus Spagyryus, Jesus Christ, be praise and glory immortal. Amen.

**THE**  
**CHEMICAL TREATISE**

**OF**

**THOMAS NORTON,**

**THE ENGLISHMAN,**

**CALLED**

**BELIEVE-ME,**

**OR**

**THE ORDINAL OF ALCHEMY.**

AN EPIGRAM

WRITTEN BY M. M., ON NORTON'S CHEMICAL

TREATISE.

As the Nile with its overflowing waters floods the surrounding country, and covers it with fertilizing slime, bearing in it the promise of a rich and laughing harvest, so the genius of Norton overflows its banks far and wide, while he makes known to us the glorious works of Nature. He spreads himself abroad over an immensity of space, that he may fertilize the fields of Alchemy, and rejoice the hearts of its husband men. If you are fortunate you will catch beneath this wide expanse of waters a fish which will satisfy the longing of your heart. And if you fail of success, yet your mind will be stored with the precious treasures of knowledge, and you will in any case be richly rewarded for your labour. The treasures of Hermes are not laid open in one book: perhaps one writer may render clear to you what another fails to explain.

**THE TREATISE, CREDE-MIHI, OR ORDINAL,  
OF THOMAS NORTON.**

**PREFACE FIRST.**

*(By the Author himself)*

THIS Book shews to the initiated knowledge, but intensifies the ignorance of the vulgar. It is the book of honouring, increasing riches, and the book of the needy, putting to flight poverty. It is the book of confidence and truth, full of counsel for kings and of teaching for prelates, a book useful for sainted men, who wish to live unspotted of sin; a secret book, the Book of the Gift of God, to chosen men a pathway of true hope, a strength to those constant in firm faith, and who unwaveringly believe in my words. Alchemy is sought by the false and the true—by false seekers without number, but they are rejected. Many are aflame with the desire of gain, but amongst a thousand thousand scarce three are chosen. There are many called to knowledge, noble and poor, learned and ignorant, but they will not submit to toil, or await the time; they do not attain to the goal because they are ungrateful. The Book of our Art is clear as light to the sons of knowledge, to whom God has freely given to understand this matter. Only let them believe this prophetic saying; to the thankful all flows forth from the fount of Divine love.

This noble science is bestowed only on those who love justice with a devout mind, but to the deceitful, the treacherous, and the violent it is denied, because their sin's hinder the coming of God's gifts.

This knowledge would often have been the glory of England's Kings, if their hope had been firmly placed upon God. One who shall have obtained his honours by means of this Art, will mend old manners, and change them for the better. When he comes, he will reform the kingdom, and by his goodness and virtue he will set an everlasting example to rulers. In his time the common people will rejoice, and render praise to God in mutual neighbourly love. O King, who art to accomplish all this, pray to God the King, and implore His aid in the matter! So the glory of thy mind will be crowned with the glory of a golden age, which shall not then be hoped for as future.

## PREFACE SECOND.

To the honour of the One God, who is Three Persons in One, this book has been written, in order that, after my death, learned and unlearned men might see how every one who will follow my good counsel, and ponder it well before he begins the work, may obtain great treasure through the Art of Alchemy. But the book is also a storehouse of mighty secrets for the learned. Let me warn the unlearned that they must study this Art with fear and trembling, lest they be led astray by the false delusions of those who counsel many costly experiments, and use high sounding words. For my part, I desire none of that fame which the world can give, but only your prayers to God for me, though you need not utter my name. Let no one trouble himself about the author, but rather let him diligently consider the contents of the Book. If you enquire into the motives of men, you will find many who are induced to give their minds to the study of Alchemy, only by the desire of gain and riches; and such men are found even among Cardinals of highest rank, Archbishops, and Bishops of lofty order, Abbots and religious Priors, also among hermits, monks, and common priests, and among Kings, princes, and lords of high degree.

For men of all classes desire to partake of our good things: merchants, and those who exercise their craft in the forge, are led captive by a longing to know this Art; nor are common mechanics content to be excluded from a share in it: they love the Art as dearly as great lords. The goldsmiths are consumed with the desire of knowing—though them we may excuse since they have daily before their eyes that which they long to possess. But we may wonder that weavers, freemasons, tailors, cobblers, and needy priests join in the general search after the Philosopher's Stone, and that even painters and glaziers cannot restrain themselves from it. Nay, tinkers presumptuously aspire to exalt themselves by its means, though they should be content with the colour with which glass is stained. Many of these workmen, however, have been deceived by giving credulous heed to impostors, who helped them to convert their gold into smoke, and though they are grieved and disappointed at the loss, they yet buoy themselves up with sanguine thoughts, and hope that they will after all reach the goal; alas, too many have I known, who, after amusing themselves with delusive hopes through a long life, have at last died in squalid poverty! For them it would have been better if they had stayed their hands at once, seeing that they met with nothing but disappointment and vexation of spirit. For, surely, he who is not very learned will do well to think twice before he meddles with this Art. Believe me, it is by no means a light matter to know all the secrets connected with the science. Nay, it is a profound philosophy, a subtle science, a sacred alchemy. Concerning which I here intend to write in a style manly, but not curious. For he who desires to instruct the common people should speak to them in a language they understand. But though I must express myself in a plain and unassuming style, no candid reader should therefore contemn me. For all that before me have written on this matter have rendered their books obscure and unintelligible by an exaggerated use of poetical imagery, parables, and metaphors which grievously obstruct the path of those who first enter on this field of knowledge. This is the reason that a beginner, who strives to put their precepts into practice, only loses his trouble and his money, as is daily seen. Hermes, Rhasis, Geber, Avicenna, Merlin, Hortulanus, Democritus, Morienus, Bacon, Raymond, Aristotle, and many others, have concealed their meaning under a veil of obscurity. Hence their books, which they have handed down to us, have been a source of endless error and delusion to the vulgar and the learned, and, in spite of the beautiful conceits

which abound in their writings, no one has been able to find a path through the wilderness of their words; yea, many have been reduced to despair. Anaxagoras indeed acquitted himself better than the rest, in his book "Concerning Natural Changes." Of all the ancient Sages whose writings I have read, he lays open most plainly the foundation of our knowledge. For this very reason Aristotle is wroth against him, and attacks him most virulently in many passages, as I can shew, his purpose being to keep men from following him. For he (Anaxagoras) was full of wisdom and love: may God above reward him for his goodness, and pardon the evil deeds of those who sow the seeds of enmity and hatred. To the latter class belonged that monk who set forth a pretentious book of A Thousand Receipts, from malice and the love of mischief—which was copied in many places, and deceived and deluded numerous enquirers, and reduced them to beggary; moreover, he represented true and approved men as forgers and impostors. For this reason I am impelled by pity to set forth the truth in a few simple words, in order to warn you against false and deceitful teaching, if, indeed, you will pay attention to me and to my words. Throw away your volumes of "Recipes," for they are full of falsehood and fraud. Do not believe them, but give diligent heed to the maxim, that nothing is wrought without its own proper cause. This is the mistake into which those self-styled "Practical Sages" fall. They do not place knowledge on a firm foundation by enquiring into the cause of things. You should therefore constantly bear this momentous rule in mind: never to set about an experiment until you fully comprehend the why and the how. He who would make good progress in this Art should also diligently eschew all falsehood. For God is Truth, and it is He who shews this Art to men: therefore keep yourself above all things unspotted from the slightest taint of falsehood. Let it be fixed in your mind as an abiding principle, under no circumstances to procure for yourselves "adulterated" metals, like those who seek to accomplish albifications and citrinations, which cannot abide a searching test, and by which they produce false silver and false coin for the purpose of duping the credulous. But God has provided that no one should succeed in attaining to this Blessed Art, who loves that which is false rather than that which is true. If any man would obtain grace of God to discover the secrets of this Art, he should be a lover of justice and truth; nor let him be too eager in his own mind to follow this Art on account of its outward advantages. He who would enjoy the fruit of his labour, should be satisfied with such wealth as is sufficient. Let him not waste time and trouble on divers methods of procedure, but let him follow the directions of this Book, which is called the "Ordinal of Alchemy," the *Crede-mihi*, an everlasting standard. For as the Ordinal instructs the presbyters concerning the ministry of the days which they must observe, so all the true and useful teaching of ill-digested books on Alchemy is here set forth in proper order. Wherefore, this Book is of inestimable value for the acquisition of the precious science, nor can its truth ever be denied, though it be composed in an unassuming style. As I have received this Art by Divine Grace, so I set it forth to you in seven chapters as fully as my fealty will permit. For I remember what is said about the judgment of God at the last day.

The first chapter will shew what persons from among the common people can attain to this knowledge, and why the science of Alchemy was by the Ancients called blessed and sacred.

In the second chapter will be set forth the wise joy and the long labours of those who follow this Art.

The third chapter will, for the sake of my fellow-men, contain a faithful description of the substance of that Stone which the Arabians call the Elixir. There you will learn whence it is obtained.

The fourth chapter will treat of the gross part of the work, which is foul and little suited to delicate persons.

The fifth chapter is concerned with the subtle part of the process which God has ordained for the learned only, but which few of the learned ever comprehend; so that the secret is really possessed by very few.

The sixth chapter deals with the question of proportion, and with the agreement of this world below with the sphere of heaven above, of which a right understanding greatly helps many learners, and proves of great assistance to them in our wonderful Art.

The seventh chapter will truly set forth to you the principles in accordance with which your fire should be regulated.

Now, O Lord, do Thou guide and assist me, for I desire to gird myself to my task! Everyone that shall happen to read this Book, I implore to offer up prayers for my soul, and not to alter that which I have written, for the better or for the worse, on the pain of my most greivous anathema. For where the sense is obscure this is for the purpose of secrecy; but if a single syllable be altered in a critical passage, it may destroy the value of the whole book. Therefore, see that which I have written be preserved intact, for though the language be humble, yet it conveys truths of most momentous importance, and it should be read not once or twice, but twenty times. Your best plan will be to read many books on Alchemy, and this one last of all.

**THOMAS NORTON'S**  
**CHEMICAL TREATISE.**

**CHAPTER I.**

A MOST wonderful Magistry and Archimagistry is the Tincture of sacred Alchemy, the marvellous science of the secret Philosophy, the singular gift bestowed upon men through the grace of Almighty God—which men have never discovered by the labour of their hands, but only by revelation, and the teaching of others. It was never bought or sold for a price to any of those who sought after it; but it has always been granted through the grace of God alone to worthy men, and perfected by long labour and the lapse of time. It was given to relieve the estate of man; it puts an end to vainglory, hope, and fear, and removes ambition, violence, and excess. It mitigates adversity, and saves men from being overwhelmed by it. Whoever has perfect knowledge of it, eschews extremes, and is content with the middle way. Some disdain to call this Art sacred, because they say that Paynims sometimes acquire a knowledge of it, though God cannot be desirous of conferring any good thing upon them, seeing that their wilful and stubborn unbelief renders them incapable of possessing that which is the cause of all good. Moreover, it is affirmed that our Art produces nothing but gold and silver, which are coined into money, or fashioned into cups and rings, but are approved and accounted by wise men the least valuable and precious of all things which are upon the earth; and hence men of this school conclude that this science, if judged by its effects, cannot claim to be regarded as sacred.

To this objection, we answer what we know to be true, that the science of this Art has never been fully revealed to anyone who has not approved himself worthy by a good and noble life, and who has not shewn himself to be deserving of this gracious gift by his love of truth, virtue, and knowledge. From those who are otherwise minded this knowledge must ever remain concealed.

Nor can anyone attain to this Art, unless there be some person sent by God to instruct him in it. For the matter is so glorious and wonderful that it cannot be fully delivered to any one but by word of mouth. Moreover, if any man would receive it, he must take a great and sacred oath, that as we his teachers refuse high rank and fame, so he will not be too eager for these frivolous distinctions, and that he will not be so presumptuous as to make the secret known to his own son; for propinquity of blood, or affinity, should be held of no account in this our Magistry. Nearness of blood, as such, does not entitle anyone to be let into the secret, but only virtue, whether in those near to us or in strangers. Therefore you should carefully test and examine the life, character, and mental aptitude of any person who would be initiated in this Art, and then you should bind him, by a sacred oath, not to let our Magistry be commonly or vulgarly known. Only when he begins to grow old and feeble, he may reveal it to one person, but not to more—and that one man must be virtuous, and generally approved by his fellows. For this Magistry must always remain a secret science, and the reason that compels us to be so careful is obvious. If any wicked man should learn to practise this Art, the event would be fraught with great danger to Christendom. For such a man would overstep all bounds of moderation, and would remove from their hereditary thrones those legitimate princes who rule over the peoples of Christendom. And the punishment of this wickedness would fall upon him who had instructed that unworthy

person in our Art. In order, then, to avoid such an outbreak of overweening pride, he who possesses the knowledge of this Art, should be scrupulously careful how he delivers it to another, and should regard it as the peculiar privilege of those who excel in virtue.

But even if this Art could, on account of its effects, be justly denied a claim to sanctity, it would still be sacred on account of its nature and essence. For as, on the one hand, no one can discover it except by the grace of God, so it is also holy, because it is a divine labour and work to change vile copper into the finest silver and gold. For no one could discover a method of producing such effects by his own thought, seeing that the substances are divers, and man cannot separate that which God has joined together. Nor could the course of Nature be quickened, unless God Himself had granted the aid of this mighty science to those whom He loves. Therefore, the ancient Sages have well called Alchemy a sacred science; and no one should be so presumptuous as to cast away the blessed gift of God. For let us only consider that God has hidden this knowledge from great and learned doctors, and out of His mercy has revealed it to men of low degree, who are faithful lovers of truth, and lowly of heart; and as there are only seven planets among the vast multitude of the stars of heaven, so amongst millions of millions of men hardly seven attain to this knowledge. As we watch men's lives, we see and learn that many scholars of profound erudition, with countless other enquirers, have striven to acquire our science, and yet that all their labour has produced as a net result—nothing. Though they have spent all their substance in the search, it has nevertheless turned out a failure. They have again and again missed the mark at which they aimed; and at last they have given up the quest in despair, and have arrived at the bitter conclusion that the Art is nothing but rank fiction and imposture. As the outcome of their fruitless enquiries they have begun to denounce our Magistry for a vain and empty thing. Let me tell such men that they take too much upon themselves in thinking that that must be nought which their wisdom is not sufficient to compass. But we are not greatly troubled by their calumnies and injurious words; for those who are wise in their own conceits, while in reality they understand nothing, are not the guests for whom our feast is prepared. Though these men cannot understand our Magistry, yet, for all that, it must remain true; and though its truth be denied by some who are lifted up by the vain pride of empty wisdom, all wise men will admit that those who have confessedly never looked upon a thing cannot be allowed to give an authoritative opinion about it. It would be foolish indeed to attach any value to a blind man's opinion about a painting; and though these men are so proud of their profundity and wisdom, I very much doubt whether they could build the tower of St. Paul's (London), or remove it from its foundations. But it is more difficult still to believe that they are keen enough to penetrate the most profound secret which this world contains. Well, now, we will say no more about them, but deliver them over to the wretchedness of their own ignorance.

Now, you who seek this wisdom, learn to distinguish the false from the true. All true enquirers into the Art of Alchemy should be well versed in the primary philosophy. Otherwise all their labour will be vain. The true seeker undertakes the search on his own account; for while he eagerly hopes to find our Delectable Stone, he does not wish to see others involved in any loss he may incur. He therefore conducts all the experiments at his own cost, nor does he grudge the expense which their labour requires. He consumes his substance and empties his coffers, and advances step by

step with great patience, basing his hope on God's assistance alone. Impostors, on the other hand, wander in ragged gown from city to city, and set traps for the unwary whom they may dupe with their pretended knowledge, and outwit by vain talk and perjury. They, say that they can augment silver, and affirm with a false oath that they can multiply both gold and silver, and thus they ingratiate themselves with the covetous, producing the excellent conjunction of Fraud and Avarice. But in no long time the multiplier of gold is found to have deceived his credulous victim with his magnificent promises and his perjured assertions—and the covetous man is reduced to beggary. This must be the result if one is not from the very first on his guard against the deceitful language of the multiplier. Of these persons I might speak at great length, but am afraid of encouraging men who are of themselves disposed to evil. I fear that by saying any more I might possibly do as much harm as good, and therefore I will only add one word to the wise: If these persons really possessed the knowledge to which they pretend, they would take good care not to make it known to others, nor would they have any need to go about boasting of their knowledge, and cheating the credulous out of their money. If these impostors were punished according to their deserts in all places where they drive their fraudulent trade, there would not be so many of them. Now these fellows put forward lying assertions about Nature when they speak of the multiplication of metals. For of this one thing you may rest assured: Metals are never multiplied. Such a thing would be contrary to Nature's methods. Nature never multiplies anything, except in either one or the other of these two ways: either by decay, which we call putrefaction, or in the case of animate creatures, by propagation. In the case of metals, there can be no propagation, though our Stone exhibits something like it. Putrefaction destroys and corrupts, but in order to be fruitful, it must go forward in some convenient place. Metals are generated in the earth; for above ground they are subject to rust: hence above ground is the place of the corruption of metals and of their gradual destruction. The cause which we assign for this fact is that above ground they are not in their proper element, and an unnatural position is destructive to natural objects, as we see, for instance, that fishes die when they are taken out of the water; and as it is natural for men, beasts, and birds to live in the air, so stones and metals are naturally generated under the earth. Physicians and apothecaries do not look for aquatic flowers on arid hills. God in His wisdom has ordained that everything should grow in its own proper place. I know that some deny this principle, and assert that metals are multiplied. For, they say, the veins of silver, lead, tin, and iron which we find in the earth, are sometimes rich and sometimes poor; and such diversity would be totally inexplicable if the metals did not multiply or grow. This fact then is thought to prove that metals grow underground—and if they grow underground, why, it is asked, should they not grow above ground, in a vessel which protects them from the influences of fire, water, and air? Our answer to this argument is that it proves nothing, because the conditions are not the same in the two cases. For the only efficient cause of metals is the mineral virtue, which is not found in every kind of earth, but only in certain places and chosen mines, into which the celestial sphere pours its rays in a straight direction year by year, and according to the arrangement of the metallic substance in these places, this or that metal is gradually formed. Only few parts of the earth are suitable for such generation—how, then, can they be multiplied above the earth? Every person of average intelligence knows that in the case of congealed water, or ice, the water, before it becomes hardened, is more plentiful in some places than in others. Before its congelation, it exists in small quantities in brooks and ditches, while more considerable veins of it are found in lakes and rivers. Afterwards, large quantities of ice are seen where there was much water;

but it would manifestly be absurd to say that the ice must have grown or multiplied in the lakes and rivers, because they contain greater masses of it than ditches or brooks. In the same way, the metals do not necessarily grow in the mountains, because in some places they exist in larger quantities than in others. A certain portion of any metal can never be increased in quantity by the action of an inherent principle; and herein minerals differ from vegetables and animals. A vegetable seed, such as an acorn, virtually contains within itself the trunk and the leaves of a tree, though they cannot at a given moment be discerned with the eye. But metals always remain exactly the same in their composition, though they be dissolved with strong waters. An ounce of silver can never become more or less than an ounce of silver. For nothing can be multiplied by inward action unless it belong to the vegetable kingdom, or the family of sensitive creatures. But the metals are elementary objects, and possess neither seed nor sensation. Hence we conclude that all multipliers of metals should be forbidden to exercise their fraudulent trade. For when a metal has once been generated, it is never added to by growth. Nevertheless, we have known one metal to be transmuted into another of a different kind by means of the cognate nature of their substances; so, for instance, iron has been changed into bronze. But nothing can produce real silver or gold except the Medicine of the Philosophers. Hence the falsehoods affected by the multipliers are eschewed and shunned by all true Sages. But all honour and reverence is due to the genuine Art of sacred Alchemy, which is concerned with the precious Medicine that has virtue to produce pure gold and silver. Of this an example exists in a certain city of Catalonia, which Raymond Lullius is supposed to have drawn up. It consists of a series of seven images, and is designed to shadow out the way of truth. Three of these pictures represent matronly figures of solid silver, and four of them represent men of gold in flowing garb. On the hems of their garments appear certain letters, the meaning of which I will proceed to expound.

"I was once an old iron horse-shoe"—such is the inscription on the garment of one woman—"but now I am the purest silver." "I," says another woman, "was iron smelted from the ore, but now I am become pure and solid gold." "I," says a third, "was once a battered piece of copper: now I am all silver." The fourth figure says: "I was once copper, generated in a vile place, but at the bidding of God I have now become perfect gold." "I," says the fifth figure, "who was once fine and pure silver, am now more excellent gold." The sixth figure proclaims that it was during 200 years a leaden pipe, but is now known by all for honest silver. The seventh says: "A wondrous thing has happened to me—I have become lead out of gold. But certainly my sisters are nearer than I."

This science derives its name from a certain King Alchymus of illustrious memory, who, being a generous and noble-hearted prince, first set himself to study this Art. He ceased not to question Nature by day and by night, and at last extorted from her a blessed answer. King Hermes also did a like thing, being deeply versed in every kind of learning. His "Quadripartite" deals with the four great branches of natural science: astrology, medicine, alchemy, and natural magic; and therein he expresses himself as follows: "Blessed is the man who knows things truly as they are, and blessed is the man who duly proves that which appertains to knowledge." It was his opinion that many are deceived in thinking that they understand that of which they do not know the cause. It is an old proverb that in a bushel of imagination there is often not even a grain of true knowledge. It is also true that by the habit of proving everything, and by wise discernment, learned men are even now adding to their stock of information. By

knowledge men understand themselves and all things; without knowledge men are beasts, and worse than beasts. Lack of knowledge renders men fierce and wild, but instruction makes them mild and gentle. It is now the custom for nobles to despise those who desire to understand the secrets of Nature; but in olden times even Kings ordained that no one should be instructed in the seven liberal sciences except those who were nobly born, and brilliantly endowed, and that he who had once devoted himself to knowledge should be bound to spend his life in its pursuit. Hence the Ancients called these sciences the seven liberal sciences, because those who wished to become perfect adepts in them should delight in them in a spirit of liberty. Freedom from all mundane cares is necessary for him who would apply himself thoroughly to the study of human law, and he who wishes to become a ripe scholar in many sciences, has much more solid reasons for turning his back on the world's toils and pleasures. This fact sufficiently shews the ground on which learned men are despised. Yet the glorious memory of the man who increases day by day in the knowledge of truth, can never perish. The man who loves wisdom, justice, and grace, may be rejected in many places, but time will circle his brow with a crown of gold. In the meantime, we must expect that those who love knowledge for its own sake shall be scorned by the ignorant multitude. Nevertheless, it should be borne in mind that though many devote themselves to this study for the sake of mere gain, yet avarice and science are incompatible yoke-fellows; he whose affections are set on mere lucre, will never discover the secrets of this Art. But he who delights in knowledge for its own sake approaches the study of our Art in the right spirit, and such a man is bound to succeed. There is no need to lengthen out this chapter any further, since we have already set forth who they are that may, with reasonable hope of success, apply themselves to the study of sacred Alchemy. Let me repeat that any such person should be a faithful Christian, and a man who is not easily moved from his purpose. He should be free from ambition, free from the necessity of borrowing from others, full of patience and endurance, and of unwavering confidence in God. He should be prepared to follow knowledge through good and evil report. His life should be free from guilt, falsehood, and sin. Such men alone possess mental aptitude for becoming proficient in this science. The next chapter deals with joy and sorrow.

## CHAPTER II.

In Normandy there once lived a monk, who deceived many persons of different ranks in life. When his mind had become filled with the vain conceit that he had a perfect knowledge of this Art, he gave himself up to such violent joy that he almost went out of his senses. Whose preposterous zeal I will attempt to excuse by adding the following brief narrative for the sake of illustration:—

This monk had led a vagrant life in France, in forgetfulness of his vow, and in the indulgence of his low desires. At last he came to this kingdom, and attempted to persuade all men that he had a perfect understanding of the Art of Alchemy, which he said he had obtained from a certain "Book of Recipes." He was desirous of achieving a mighty deed, which should hand down the glory of his name to posterity, and for ever establish his reputation in this island. He was always thinking how he should spend the vast wealth which (he thought) he would soon be able to procure. At last he said to himself: "Behold, I know where I shall find a faithful man, who can aid me in this matter, and help me to the fulfilment of my wish: which is, to erect in a glorious manner on Salisbury Plain, fifteen magnificent Abbeys in a short space of time, and each within a mile of the other." In pursuance of this design, the monk came to me, and laid open his whole plan, at the same time requesting me to assist him with my counsel. I have promised before the shrine of Saint James not to divulge his name; but yet I may without prejudice to my vow speak about his foolish undertaking. After telling me of his proficiency in this glorious Art, he said that he wanted nothing but an opportunity of labouring for the King's good, and permission from the Council to buy land for the aforesaid Abbeys. As to the expense, he said it would be easy for him to make it good. But he was in great doubt, where, from whom, and how he was to purchase the land. After listening to the exposition of his lofty design, I desired to test his learning and his knowledge of scholastic science; and I found that in these branches of attainment he was sadly to seek. Yet I contained myself, and kept my own counsel, in order that I might learn more about his designs. So I told him that the matter was not of sufficient importance to be laid before the King, for everyone would look upon the same as an idle tale, if no proof of his pretensions was forthcoming. The monk answered that he had in the fire a substance which would supply him with all that he needed, and that within forty days he could triumphantly demonstrate to me the truth of his words. I replied that I would not now press him any further, but that I would wait the allotted time. But when the date which he had fixed arrived, the monk's science evaporated, and all his Abbeys and lofty designs vanished into thin air; as the impostor had come, so he departed, not without great shame and confusion. But shortly afterwards I heard that he had deceived many kind-hearted people, and had then again returned to France. It seemed a great pity that fifteen abbeys, seats of religion, sanctity, and learning, should so unceremoniously have vanished with him! It was also wonderful that such a man could have deluded himself into the belief that he could erect fifteen abbeys, while he himself could not live true to his vow of obedience, and must needs wander about as an apostate vagabond, for the purpose of obtaining a knowledge of this sacred Art. But I have already repeatedly said that just because it is sacred, no false or deceitful person can attain to it. In order to illustrate my meaning, I will now add another example. There was a man who thought that he was as deeply versed in this Art as Raymond Lullius or Friar Bacon, for which reason he was so presumptuous as to call himself peerless. He was the priest of a small town, not far from the city of London, and was thought by others to have little skill in

preaching. This man felt sure that he had discovered the secret of our Art, and so, in order to advance his fame, he formed the design of throwing a bridge over the Thames for the benefit of travellers, and for the convenience of the whole neighbourhood. But nothing would serve him but he must set up a grand and lofty structure which should compel the admiration of all beholders. It was to have towers covered with flaming gold, and its pillars were to be such as had never been seen before. He frequently spoke of the new thing which he was going to accomplish, for his bridge was to be seen far and wide by night, and was to endure for ever; its glory was never to grow dim. Then he revolved different plans in his mind concerning the best manner of carrying out his design. At first he thought that flaming torches would answer his purpose, and elaborated a plan of setting them up in sufficient numbers. But soon he was seized with a fear that after his death the trustees of his benefaction might neglect the torches, and apply the money allotted to that purpose in some other way, Thus he at length arrived at the conclusion that it would be best to light up his bridge by night with great flaming gems and carbuncles, such as should be visible far and wide, and radiate their splendour in all directions. But here again he was troubled with new misgivings, where such carbuncles could be found, and where he should meet with wise and reliable men, who would travel through all the countries of the world, and procure for him a sufficient number of these jewels. These thoughts caused him so much anxiety, that he wasted away to a mere shadow. All this time, of course, he was firmly persuaded that he had found the true secret of our Art. But when the year came to an end, his Art and all his substance vanished with it; for he had opened his glass vessel and found that it contained neither gold nor silver. Then he flew into a great passion, and cursed himself in the bitterness of his heart. For he had spent all his wealth, and passed the rest of his life in poverty. What more shall I say about him? His case speaks for itself.

When learned scholars and those who frequent the schools hear of the melancholy fate of these foolish persons, they ought to take warning, and remember that the same things may happen to themselves, if they are not constantly on their guard. For many of them are but too ready lightly to receive all conclusions, however false, if they only find them boldly asserted in books. This easy and unquestioning confidence may bring in its train poverty and vexation of spirit. The hope afforded by such teaching is an empty delight and a veritable fools' paradise, But the true sons of our Art stay their hope on God alone, since they know that without Him everything is a delusion and a failure, for they know that a man who has not the Beginning of all Knowledge cannot conduct his enquiry to a successful end. No man, O God, can comprehend without Thee, and though the exposition of the Art be uttered in his ears, without Thee it is but idle breath to him! Of Thee, O God, comes all blessed and successful effort! Thou art of all good things both the beginning and the end. Now I have told you something of the joy which is caused by the vain hopes of foolish enquirers; hear now also about the sorrow, of which this Art has been a source to many whose hopes have been grievously disappointed.

The first cause of sorrow is to see and realize that among the many who seek this Art only few ever find it, and that no one can attain this knowledge unless he be taught before he begins; and he is truly learned, and finely endowed, who can apprehend it by the teaching of another. The subtle shades of natural differences must be well known to the man who desires to be initiated in the most profound secret of the universe; and no form of words can be so accurate as to safeguard the learner against

error. For many who have now departed this life have gone widely astray before they finally succeeded in their search after our Stone. Either at the very outset, or at a later stage of the work, all are liable to error, until they are enlightened by the teaching of experience, and hit upon the proper regulation of heat and cold. Nobody is more liable to error in respect to this matter than your bold and overconfident enquirer. Nobody sooner mars our work, than he who is in too great a hurry to complete it. The man who would bring this matter to perfection, should set about it cautiously and heedfully. The most grievous circumstance connected with our Art, is that if you make a mistake in any part of it, you have to do it all over again from the very beginning. Anyone who gives himself up to this search must therefore expect to meet with much vexation of spirit. He will frequently have to change his course in consequence of new discoveries which he makes. His experiments will often turn out failures, his mind will often be in a state of doubt and perplexity; and thus he will continue to be vexed by conflicting results, until at length he reaches the goal of his desire. Again, let me tell you a little more about the sorrows and troubles of the Alchemist, which may considerably moderate your desire to acquire the practice of this Art. At first it is most difficult, as the Sages say, to find out among so many impostors, the man who has a perfect understanding of our science. And when you have found a truly learned master, you have not yet by any means left all your trouble far behind you. If your mind is devoted to virtue, the Devil will do his utmost to frustrate your search by one or the other of three stumbling blocks, namely, haste, despair, or deception. For he is afraid of the good works which you may do if you succeed in mastering this secret. The first danger lies in undue haste, which destroys and mars the work of many. All authors who have written about this Art, agree in saying, like the author of the little book of "The Philosopher's Feast," that undue haste is of the Devil. Hence he will the soonest make an end who tarries a little at the beginning; and those who act otherwise will discover to their cost the truth of the proverb which says that: "The greater haste we make, the less will be our speed." For he who is in a hurry will complete his work neither in a month, nor yet in a year; and in this Art it will always be true that the man who is in a hurry will never be without matter of complaint. Rest assured also that haste will precipitate you from the pinnacle of truth. It is the Devil's subtlest device to ensnare us; for this haste is an *ignis-fatuus* by which he causes us to wander from the right path. The man who has found grace stoutly sets his face against hurry; he does so as a matter of habit, for in a moment of time haste may mar your whole work. Therefore be on your guard against hurry, accounting it as a device of the Devil. Time will not allow me to caution you with sufficient vehemence of feeling against habits of hurried work. Many pierce themselves through with sharp sorrows, because they are always in a hurry, and full of impatience to reach the goal, which comes about through the temptation of Satan. I will say no more about hurry, but blessed is he who possesses patience. If the enemy does not prevail against you by hurry, he will assault you with despondency, and will be constantly putting into your minds discouraging thoughts, how those who seek this Art are many, while they are few that find it, and how those who fail are often wiser men than yourself. He will then ask you what hope there can be of your attaining the grand arcanum; moreover, he will vex you with doubts, whether your master is himself possessed of the secret which he professes to impart to you; or whether he is not concealing from you the best part of that which he knows. The Evil One will endeavour to fill your mind with these doubts, in order to turn you from your purpose by diffidence and despondency. Nor will anything avail against his assaults, except the calm confidence inspired by virtue, and the sound conclusions of reason. Your fears will be scattered to the winds if you quietly consider

the high character of your master and teacher; nor need you despair if you can call to mind that he was induced to instruct you by love, and by no selfish motive. It is difficult indeed to trust a man who offers you his services; for such a person stands more in need of you than you of him. But if your master be such a man as I have directed you to seek, and if he has waited for you to come to him, you ought to be strongly armed against the shafts of distrust. If your master be at all such a man as mine was, you can have no excuse for doubting him, for mine was noble and true, a lover of justice, and an enemy to deceit. Moreover, he was a good keeper of his secret, and when others ostentatiously displayed their knowledge, he held his peace as if he knew nothing. When others talked in his presence about the colours of the rose, he would listen in grave and impenetrable silence. Him I attended during many years; but he would not impart to me anything of moment, until he had made me submit to many tests for the purpose of proving my disposition; and when he had found me faithful and true, and had seen the great hope which I had conceived in my mind, I obtained favour in his eyes through the will of God, and his heart inclined to me. When at length he thought that I should not be put off any longer—since my scholarly attainments and the generous aspiration of my soul had moved his heart, and made it go out to me—he took up his pen, and wrote to me as follows: "My faithful friend and beloved brother, I am constrained to accede to your request, as no other person like you will ever come to me. The time has arrived for you to receive this favour of me on account of your manly character and firm faith, your approved virtue and wisdom, your truthfulness, love, and perseverance, your constancy, and the generous aspiration of your soul. This your excellent mental condition I will now reward, to your lasting solace and comfort, by divulging to you the mighty secret. For this purpose it is necessary to converse with you by word of mouth; if I laid open to you the secret in writing, I should be violating my oath. Hence it is necessary that we should meet; and when you come, I will make you the heir of my Art, and depart from this land. You shall be my brother and my heir in respect of this grand secret, which is the despair of the learned. For this reason give thanks to God for this message: it is better than to become heir-apparent to a crown. For only those whom God has chosen next to His own heavenly saints, ever receive this Art by which He is so highly honoured. I will write no more to you at the present time: mount on horseback, and come to me without delay." When I had perused these lines, I set out at the very same hour, and at once hastened to my master, though the distance exceeded a hundred miles. I continued with him forty days, and learned all the secrets of Alchemy (although before I had understood philosophy as well as any other person in the kingdom). Yet it would be foolish to suppose that the work itself can be completed within forty days: I say that I was fully instructed within that time, but the work itself requires a longer period. Then all that had been dark became as clear as the light, when I beheld the secret gates of Nature unbarred; I saw so plainly the causes and the rationale of everything, that it was no longer possible for me to doubt or despair. If you are as fortunate in your master as I, you will never be assailed by despondency.

The third enemy against whom you must guard is deceit, and this one is perhaps more dangerous than the other two. The servants whom you must employ to feed your furnaces are frequently most untrustworthy. Some are careless, and go to sleep when they should be attending to the fire; others are depraved, and do you all the harm they can; others, again, are either stupid or conceited and over-confident, and disobey instructions; some have fingers retentive of other people's property, or they are drunken, negligent, and absent-minded. Be on your guard against all these, if you

wish to be spared some great loss. If servants are faithful, they are generally stupid; those who are quick-witted, are generally also false; and it is difficult to say whether the deceitful or the stupid are the greater evil of the two. For when I had all my experiments in proper train, some thievish servants ran away with my materials and utensils, and left me nothing but the empty laboratory; and when I calculated the cost, time, and labour of beginning the work all over again, I had almost in the bitterness of my heart resolved to bid an everlasting farewell to this Art of Alchemy. For it will hardly be believed how completely I had been stripped of all that I possessed, although ten trustworthy persons still survive to attest the fact. Indeed the blow was so great that it could hardly have been inflicted on me by human agency alone, without the instigation and co-operation of the Devil. I also made an Elixir of Life, of which a merchant's wife bereft me, and I procured a quintessence, with many other precious preparations, but of all these things I was robbed by wicked men, and thus found, to my smart, that in the sweetest cup of this world's joy, there is a liberal infusion of bitterness. Let me tell you a little more of what has fallen under my observation, concerning the perplexities of this work. The calamity of which I am thinking happened to a good and godly man; and I am the only person that can give a true account of it.

Thomas Dalton, a devout and religious servant of God, possessed a larger quantity of the Red Medicine than has ever been obtained by any other Englishman. Now a certain knight of King Edward's household, named Thomas Herbert, dragged this Dalton forth by violence from an abbey in Gloucestershire, and brought him before the King, where he was confronted with Delvis. For Dalton had been scribe (secretary) to this William Delvis, and Delvis had told the King about Dalton's skill in this Art. Delvis was a faithful servant, who always stood in the presence of King Edward, and he deposed that within an hour Dalton had made for himself one thousand pounds sterling of gold, fully equal to that of the royal coin: and he confirmed his testimony by a most sacred oath upon the Bible. Then Dalton looked full upon Delvis, and said: "O Delvis, thou hast perjured thyself! Thou hast foully broken the pledge thou gavest me, and hast betrayed me even as Judas betrayed his Master." "I did, indeed," rejoined Delvis, "once swear to thee that I would not betray thy secret; yet I do not consider myself as guilty of perjury, since the service of my King and country release me from my oath." Then Dalton soberly answered him thus: "This subterfuge does not excuse thy perjury; for if it did, how could the King himself trust thee, who hast confessed thy perjury in his presence? And," he continued, turning to His Majesty, "I do admit that I possessed this Medicine for a long time; but at length it was only a source of grief and anxiety to me—and therefore after retiring to that abbey from which I was brought hither, I threw it into a tidal river which is daily renewed by the ebb and flow of the sea. Thus as much wealth has been lost as would have sufficed for the outfit and support of twenty thousand knights, who might have been willing to go forth and recover the Holy Sepulchre. For the love of God, I kept this Medicine many years, in order that through its means I might succour a King who should undertake this expedition. But as this sacred duty was forgotten, the Medicine is now irrecoverably lost." The King replied that it was a foolish act to destroy so wonderful a treasure, and demanded that Dalton should prepare some more of the Medicine. "No," said Dalton, "that can never be." "Why not?" enquired the King. "How did you obtain it?" Dalton replied that he had received it from a learned Canon of Lichfield, whose works he had diligently attended to during many years, until at length the Canon had bequeathed to him as much of the Medicine as he had

ever possessed. Then the King gave Dalton four marks, with liberty to depart withersoever he desired; and, at parting, he expressed his grief and concern that he had not known Dalton before. But as it oftens happens that the worst tyrants are found in the retinues of kings, so Herbert now caused Dalton to be seized, robbed of the money which the King had given him, and carried off to Stepney, where he detained him a long time. Thence Dalton was conveyed by Herbert to a castle in Gloucestershire, cast into the dungeon thereof, and kept close prisoner for four years, during which period he was tormented by Herbert in every conceivable manner. At length he was led forth to execution, and when he saw the ministers of death, he said: "O blessed Lord Jesus, I have been separated from Thee too long: Thou didst give me this knowledge, and I have used it without overweening pride. I have not been able to find a fit person to whom .I might have bequeathed my wisdom. Therefore, dearest Lord, I now resign Thy gift into Thy own hands." Then he poured forth a devout prayer, and thereupon turned to the executioner and said, with a smile, "Now thou mayest work thy will."

When Herbert heard these words, his eyes filled with tears, because neither deceit, imprisonment, nor death could induce his victim to yield up the precious secret; and he bade his servants let the old man go, as his obstinacy was not to be overcome. Then Dalton arose, looked about him with sadness and disappointment depicted in his countenance, and departed with a heavy heart; for he had no desire to live even another year. This injury happened to him through the greed and cruelty of godless men. Herbert died not long after, and Delvis lost his life at Tewkesbury. Such are the sufferings which they who aspire to a knowledge of this Art, must lay their account with having to bear. Yet we also see how the greed of wicked men over-reaches itself. For if Herbert had treated Dalton with kindness and gentleness, instead of with cruelty, insolence, and violence, much advantage might have been reaped not, only by the King, but also by the entire commonwealth. Yet we need not wonder that gracious means were not used, for sin reigns everywhere in this kingdom. Otherwise, the people might have obtained great relief from rates and taxes, and much money might have been bestowed in charity among knights, priests, and the common people. Hence we may learn that profligate violence is incapable of acquiring wisdom; for virtue and vice are contrary the one to the other, and men abandoned to the one cannot receive the reward of the other. If vicious persons could gain a full knowledge of this Art, their overbearing insolence would grow unendurable, and their ambition would overleap all bounds; they would by its means become worse men than they were before. Now this chapter respecting the delights and sufferings of our Art is finished. The next will declare the Matter of our Stone.

### CHAPTER III.

Tonsilus had been engaged in the momentous search during more than sixty years. Bryan, too, and Halton, in the western parts, had been employed day and night in practical experiments; yet they did not find this noble science, because they did not know the Matter and root of the Art, but sought it by a mistaken method, until they had wasted their lives and goods. They were put to great expense, loss, and suffering, by the recipes according to which they worked. Then Tonsil complained to me with tears that he was in great bitterness of soul, because he had spent the better part of his life on false receipts, vile substances, herbs, gums, roots, and grasses, of which he enumerated many species, as, for instance, crowfoot, celandine, mezerion, lunaria, and mortagon—also upon hair, eggs vervein, excrements, and urine—upon antimony, arsenic, honey, wax, and wine—on quicklime, vitriol, marchasita, and all kinds of minerals—on amalgams, albifications, and citrinations. All had been reduced to nothing by his operations; for he had not well considered his purpose, and the due proportions of natural truth. After he had failed with all these substances he thought nothing could be better than to operate on human blood, until I told him that by a fierce fire blood was destroyed, and converted into smoke. Then he besought me by the love of Christ to declare to him the true substance of the Stone. "Tonsil," I replied, "what good would it do an old man like you? Renounce this pursuit and give yourself up to prayer; for that is what your time of life requires. If you did know the substance of our Stone, you would fall a victim to old age before you could prepare it." But he bade me not to trouble myself about what might be the result to himself. "It would be a comfort to me at least to know the substance of the Stone which I have sought so long." "Tonsil," I said, "your request is more easily made than granted. For all the authors who deal with this subject write about it in obscure language, and not one of them declares it plainly; nay, they beseech God to remove them suddenly out of this world, if they ever write books about the grand secret. For many of them have been fearful of committing to paper more than was right about this science; and not one of them has given more than one or two plain hints respecting it. They did not write with the object of divulging their secret to the world, but in an obscurely allusive style, in order that they might be able to recognize those who understood their meaning as brothers and fellow adepts. Hence you must not be content with reading only one book, but you should study a variety of authors; because, according to the learned Arnold, one book opens up the understanding of another. The same thought is expressed by the learned Anaxagoras, who testifies that if a man will not take the trouble of reading many books, he can never attain to a practical knowledge of our Art. But though I may not reveal to you for the sake of charity what has never yet been plainly set forth by the brethren of our Art, I may at least give you some comfort by answering as straightforwardly as I can, any questions which you may like to put to me." "Good Master," he replied, "tell me truly whether the substance be Sun (gold) and Mercury, or Sun and Moon (silver), or whether these three must be taken together; or whether it be Gold by itself, or Mercury by itself, or whether Sulphur with these two be the substance of the Stone? Or, is salt of ammonia nearer the truth, or is some other mineral the right thing to use in our Art?" The questions you have put, Tonsil, are wisely and astutely conceived; nevertheless, you have not named the substance, except generically. For you must take a part of these, and of other things at various times, according to the requirements of the Art. Divers things are used in the preparation of our Stone, but there are two materials, and only one Stone. Between the two there is the same difference as that between a mother and her offspring; or,

looking at the matter from another point of view, the difference resembles that which exists between male and female. These two substances will furnish you with all that you need. As for the white Tincture, if you are wise, one of these you shall find to be a Stone, which is rightly named, because, like a stone, it is indestructible by fire. Yet it is not like a stone to the touch or the sight, but is a fine earthy powder, of a dull red. In its separate form we call it our ground litharge; at first it is brown and ruddy, and then of a whitish colour. It is called our chosen Marcasite, and one ounce of it is worth more than fifty pounds. Yet is it not sold in the cities of Christendom, but he who desires it, must either get it made by someone else, or prepare it himself. There is this advantage concerning it, that to make it once well dispenses with all need of repeating the task. Ancient writers call it a thing of small price, because it is lightly esteemed by the merchants, and no one that finds it cares to pick it up, any more than if it were an ounce of dirt. Few will believe that it is a pearl of great price, for it is known to none but the wise. Thus have I laid bare to you a great secret, more plainly than any of the dead masters. Then, Tonsilus, you must also have another Stone, or else you want your principal material. This Stone is most glorious, fair, and bright. It is sold as a stone, and looks like a stone of singular transparency and brilliance. One ounce of it may, in most places, be obtained for about twenty shillings. Its name is Magnesia, but its real nature is known to few. It is found on the tops of the highest mountains, and in the lowest depths of the earth Plato knew its properties and called it by its name. Chaucer says, in the Canon's Tale, that it is called Dytanos, thus defining an obscure term in language still more hopelessly obscure; but it is impossible to understand a thing if for one unintelligible term another still less intelligible is substituted. Nevertheless, my Tonsilus, I will endeavour to explain to you the meaning of Magnesia in our own tongue. *Magos* is Greek, and is equivalent to the Latin *mirabile*; *aes* is money, *ycos*, science; *A* is God; that is to say, it is a matter in which much divine knowledge is involved. Now you know what Magnesia is—it is *res aeris*, and in it lies hidden a wonderful and divine secret. These two stones, my Tonsilus, you must take as your materials for the preparation of the Elixir. Although at first no further materials are needed, yet, as I have already hinted, divers other things are of great use in our Art. The great secret was never before so plainly expounded. But take my explanation in all its fulness; and I will pray God, lest my excess of frankness be reckoned to me for a crime—for I fear that I have suffered my pen to run riot. Though few may understand what I have said, yet there are some students of this Art so subtle, cunning, and keen-witted, that still fewer data would suffice to them for the discovery of all that we know. Nevertheless, God shall provide that none shall find it except the man of a pure and virtuous life. It was with this end in view that the ancient writers concealed with so much solicitude the matters of our Stone, which I have here declared. You need no other substances but these two for the preparation of the white Stone, except salt of ammonia, and that kind of sulphur which is extracted from metals. These two substances suffice for the fulfilment of your desire; none but these two finally abide the test of the fire. Sulphur is burned, and loses its colour. But our Litharge is indestructible. Do not set about with any metal or quicksilver. If you destroy its whole composition, some of its component parts will be of use to you. But the principal substances are the two which I have mentioned, namely, Magnesia and Litharge, its brother."

## CHAPTER IV.

I will not attempt to escape from the task which I have undertaken to expound the great work: I will instruct you as fully as possible in this secret, and all my endeavour shall be to make known to you the truth. As far as I may do so without prejudice to my vow, I will be your guide, and shew you the way to the goal of your desire. If you consider into what a state of obscurity and confusion the different parts of this work have been wilfully thrown by the old writers, you will understand the difficulty of my task. None of them has declared more than one point of our experiment; and for this reason their writings, even if you understand them, will not enable you to practise the Art yourself. Arnold testifies in his books that the central secret of our Art is to know the substance on which it is based; and in his work "Multifary," where he shews how pure and simple essences are to be recognised, he says that our fundamental matter is of two kinds; but he does not tell us how they are to be found. Their names you have already learned in the last chapter. Friar Bacon dwells more fully on this point, where he says: "Divide all parts into their cognate elements. For the unlearned do not proceed in this way; but they continue pertinaciously and senselessly to add more and more to a divisible substance—and while they fancy that they are on the point of bringing to perfection the flower of our Art, all that they really effect is the multiplication of error." In this passage Bacon, like his predecessors, appears fearful of saying too much. Perhaps you also remember what Avicenna says, in his "Gate": "You must go forward to perfection by true teaching in accordance with the facts of Nature: you must eat to drink, and drink to eat, and in the mean season be covered with perspiration." Rhasis expresses himself to the same effect, but warns us against suffering the matter to consume its food too quickly: "Let it assimilate its aliment little by little." Of this rule the Prophet also makes mention, if you rightly comprehend his meaning: "Thou hast visited the earth," he says, "and watered it: Thou hast multiplied its wealth: the fruitful land hast Thou turned into a dry place, and the arid land into a river of water." When it has plenty of meat and drink, it is needful to watch at a time when the body craves sleep. For our labour demands constant vigils and great diligence, and it must be nourished and fed with precious substances. "Therefore let all poor men eschew this experiment," says Arnold, "as this Art is for the rich of this world"—and I myself can attest to ail poor men the truth of these words. "Moreover," he continues, "let the enquirer be patient and of an even temper, for those who are in a hurry will never reach the goal." The length of time required for the purification of the substance, is a stone of stumbling to many who will not believe in it. I advise you, therefore, ye poor, not to attempt the solution of this mystery, but to stay your hands before it is too late. One fourth of an ounce too much or too little may in a single hour mar and destroy the labour of weeks. The substance you must prepare with gentle heat, and so long as there is no violent effervescence, you may keep it over the fire: you should gradually consume it by gentle coction, but it must not be suffered to throw up great bubbles, as such a course would be indicative of haste. Gentleness and patience will mark out to you the safest method, and enable you to avoid the manifold dangers which beset the enquirer's path. One of the most difficult experiments in the gross work, is the classification of our intermediate minerals. The different media that are used must all be in a highly purified state, if the work is to be brought to a successful conclusion. For the pure and impure, the mature and immature, are by nature violently opposed to each other; that which is fixed naturally adheres to fixed substances, and volatile substances are sympathetically attracted by that which is volatile. Everywhere Nature strives to produce harmony by drawing like to like. Now

you will find our gross work to be generically impure; and it is a matter of great difficulty and danger, requiring the utmost wisdom of the wise, and confounding the folly of the ignorant, to purge our Substance from all foreign matter. The learned as well as the simple are often led astray at this point, and prove the truth of the saying of Anaxagoras, that all men need to be taught discretion by bitter experience. Once I heard a wise man say that, at the present time, magnesia (in a pure state) is sold in Catalonia, together with the other intermediate minerals, so that the hands of a fastidious man need now no longer be defiled with this dirty work; and if this were really true, both the commencement and the consummation of your work would be a much easier matter than it is under ordinary conditions. For if you are compelled to do all that I have had to accomplish, you will be wearied out before you reach the work proper. The work of the Sages does not begin until all substances are pure, both without and within. Let us remember that as we are seeking a tincture which imparts perfection to all things else, we must remove from it all that is foul and vile. Of the different media, each has its own properties, and its own function to perform, according to its essential nature; of those media by which our experiment is advanced, some are of their own nature helpful, and others are harmful. Our Apothecaries do not understand the secret of their preparation, and we refuse to instruct them, because we know that they would adulterate them (for the purpose of deceiving their customers) rather than take diligent and conscientious pains to let their drugs be genuine and pure. It is their practice (as I know by bitter experience) to ask a high price, and to furnish an untrustworthy article. If a man would have materials on which he may rely, he must not be afraid of soiling his own hands, nor must he shun expense, though it may swallow up all his hoarded wealth. In the gross work that man is furthest from the goal who is in too great a hurry to reach it. If our great work, with all that belongs to it, could be accomplished in three years, artists might account themselves [fortunate](#); for when it has once been brought to a satisfactory conclusion, there is no need to undertake it a second time, if indeed one is skilled in the art of augmenting his medicine; and the attainment of this skill is one of the great objects of our Magistry. There is no need for me to name in this place the different minerals which are required, seeing that Albertus has most fully discussed this point. I might say much about the properties of minerals; but the discussion would prove barren of results in the advancement of our Art. One of the most important conditions of success is the mechanical skill in the manipulation of experiments; in regard to these it is possible to go astray in a thousand ways, the path being beset with all but insurmountable difficulties at every step. Therefore, believe that which the ancient writers tell us—that nothing can be rightly done without experience. Consider all circumstances, and take care to secure uniformity in all that is required. Use one vessel which is simple both in material and in shape; beware of one made of mixed material, lest some accident happen at a critical moment. This general admonition will save me the trouble of laying down, and you the trouble of remembering, a hundred special cautions; and this instruction may suffice for him who is wisely intent on the practice of our Art. If your servants are faithful and true, you will be able to carry out your experiments without constant vexation. Therefore, if you would be free from all fear, over the gross work, follow my counsel, and never engage married men; for they soon give in and pretend that they are tired out, as I can assure you from my own experience. Hire your workmen for certain stipulated wages, and not for longer periods than twenty-four hours at a time. Give them higher wages than they would receive elsewhere, and be prompt and ready in your payments. For your kindness will stir up in their hearts love and reverence, and a spirit of zeal in the conduct of the

work committed to them; for they know withal that they are liable to be discharged at once if they are negligent in your service. Married men will not agree to be engaged for such short periods; therefore, give them a wide berth. If I had known and acted on this principle before, I might have been spared much loss and vexation. In the pursuit of our Art, you must preserve at all times your liberty of action; and you should also take care, from time to time, to unbend your mind from its sterner employments with some convenient recreation; otherwise your [spirits](#) might be weighed down with melancholy and despair, and you might lose heart for the continuation of your work. There is no need to add much to this chapter, for the ancient writers have already fully set forth all that I have not yet touched upon. But that which they have omitted is most plainly expounded in this Book. Hence it is called the Ordinal of Alchemy, the supplement of all other works on the subject. The following chapter is for the initiated, and shews all the rules to be observed in the subtle part of the work.

## CHAPTER V.

When Briseus was a money-changer, he caused loss to many persons, but to others his dealings were a source of delight and joy; and as this fact seemed at the time a wonder and marvel to all who heard of it, so in our own time—not so very long ago—an almost miraculous event was observed to take place: within the short space of ten days the same bed in a house near Leadenhall was successively occupied by three Masters of this Art, every one of whom possessed both the white and the red Tincture; though hardly one person amongst a million of men ever becomes possessed of the glorious prize. One of them, as I was told, was from the Duchy of Lorraine, the second hailed from the Midland Counties of England, the third was the youngest, and was born near a Cross, which stands at the boundary of three shires. Wise men had foretold from the conjunction of planets that prevailed at his birth, that he would be an ornament to England. Anyone might travel through the length and breadth of Europe without meeting with three such Masters. Two of them are about to depart, but the third will remain and do much good in this part of the world. Nevertheless, the sins of our rulers will delay the good which otherwise he might confer upon our country at once. The oldest of the three Masters prophesied concerning this young adept, that he would have to endure much suffering at the hands of those who owed him the greatest debt of gratitude. He also uttered many other prophecies, some of which were verified by the event, while the rest remain to be fulfilled. "One thing is most certain," he said, "after great sorrow there will be great joy in all parts of this country—joy which will be experienced by all good men." The youth enquired when this thing should be, and the old man's answer was that it should come to pass when the Cross was honoured by night and by day in the land of God, and the land of Light: which thing will happen in due time, but is delayed by the greivous wickedness of men. But when the blessed hour arrives, this Art will be revealed to a King; and more glorious things will then be brought to pass than it is possible for us to enumerate in this place, when he shall have reformed our manners and abolished all abuses. He will investigate this science in secret, and will be instructed in it by hermits, or monks. So King Calid, in his time of need, sought this knowledge of many, until it was imparted to him by Morienus, who succoured the King with his counsel, being removed thereto by his nobleness and virtue. But now we will speak of this subject no longer, but proceed to give an account of the subtle work. He that would understand it must be deeply learned. He should know elementary philosophy if he wishes to study Alchemy.

Now, let me tell you who are intent upon this Art, that when materials have by preparation been rendered fit for generation, they must by division be separated into four elements. If you cannot do this, go and learn of Hortulanus, who has written a special treatise on the subject—in which treatise he shews how to divide wine into its elements. Moreover, you should know the effects of the four qualities—heat, cold, moisture, and dryness—of which all things are composed; and because in this Art you are specially desirous of obtaining a colour which abides the fire, you ought also to know, before you set about its production, how colours are generated. For every colour that can be named is seen in our work, before the white colour appears. Moreover, you must be able to melt your substance easily, like wax or gum. Otherwise, according to the Masters, it could not enter or penetrate metals. The substance should be both fixed and fluxible, and have abundance of colour. To conjoin these three contraries in one substance, is the great secret of our Art. Nevertheless, an apt learner may find it expounded in this chapter. And first—to

speak as briefly and concisely as possible concerning the aforesaid four primary qualities: heat and cold are active qualities; moisture and dryness, on the other hand, are qualities of a passive kind. For the latter are always passively subject to the former, as, for instance, stones when they become lime, and water when it is changed to ice. Whence you may easily see that nothing is fully wrought except by heat and cold. Yet the passive qualities have some power, as we find every day in mechanical operations, in the baking of bread, the brewing of beer, and other processes brought about by the operation of moisture and dryness. Aristotle, in his physical treatise, and many others, say that from action proceeds knowledge; thus they call practice the source and root of speculation and of all science. For the properties of all things are perceived by watching their operations, as, from the colour of urine we hear physicians draw conclusions in regard to the excess or lack of animal heat in the body. By means of those four primary qualities, we study the colours in the due order of their succession. But we can have no real assurance respecting the white colour, except in a very pure substance. You will be materially assisted in your task by a knowledge of the way in which colours are daily generated. Colour is the extremity of every transparent body; a clear substance is here beautifully consummated. If dryness dominates in a dry substance, its colour will most certainly be white. Of this fact you may convince yourself by ocular proof in the case of burned bones, or of quicklime made of stones. Where cold prevails in a moist and clear substance, a white colour will be the result, as is seen in the case of ice, or water indurated by frost. The cause has already before been declared in our philosophy; but here I do not speak of common philosophy, but only adduce these facts in illustration of alchemistic principles. And indeed one fact explains another, as the offspring may be known by looking at its mother. If heat operates on a thick and moist substance, a black colour will be the result.

If you desire an illustration of this principle, you need only put some green wood on the fire. When cold is brought to bear on a thick and dry substance, the colour which is produced will be black. The reason is that the substance is compact and very thick, and under the influence of cold which is destructive of life, the thickness causes obscurity and absence of light; and negation of colour is blackness. Thus you may accept it for an universal fact that a clear substance is a white substance. The efficient cause is not always the same; it is sometimes heat, and sometimes it is cold. But blackness and whiteness (as every one knows) are the two extremes of colour. Hence your work must begin with blackness, if whiteness is its final perfection. Red—as the Sages say—is an intermediate colour between black and white. Nevertheless you may believe what I say: Red is the final colour in Alchemy. The Sages also tell us that pink and orange are colours intermediate between white and red; and that green and grey are intermediate colours between red and black. Flesh colour is seen in very pure substances. Physicians have discovered nineteen colours intermediate between white and black in urine; of these colours one is whitish, like that of the onyx stone. Magnesia appears to partake of this colour—though Magnesia throws out a mild, pure splendour in the subtle stage of our Art; and here we behold all colours that ever were seen by mortal eye—a hundred colours, and certainly a good many more than have been observed in urine; and in all those colours our Stone must be found in all its successive stages. In the ordering of your practical experiments, and in conceiving the different parts of the work in your own mind, you must have as many phases, or stages, as there are colours. If you do not know the different stages of this Art, you will find them in Raymond's "General Exposition of Alchemy." Gilbert Kymer has

indeed left us a fanciful book, in which he describes seventeen proportions. But they do not suffice for this science, of which he was never able to discover the true secret, though he was profoundly learned in Medicine.

Such, however, is the strength of the human constitution, that it often overcomes disease in spite of the doctor's physic: and the physician's art is praised in many cases where his remedies had nothing to do with the cure, or even retarded it. But the case is different with respect to our mineral medicine; for our Art is raised far above all generations, and exists only in the wisdom of the Artist, as any wise man may discover by experience. Thus, the true foundation of Alchemy consists in the proper graduation of the work, and in the correct adjustment of heat and cold, moisture and dryness; also in the knowledge that through these qualities others are generated, such as hardness and softness, heaviness and lightness, roughness and smoothness—according to the addition of these primary qualities in certain proportions of weight, number, and measure. Under these three categories we may range everything that God has made. For God has created and ordered all things in accordance with certain proportions of number, weight, and measure; and if you depart from these proportions, you destroy the harmony of Nature. It is therefore a wise caution which is given by Anaxagoras, that we should not proceed to join together our elements, until we have discovered the exact proportion of weight in which all the elements are found in the substances with which we have to deal. Bacon says that the Ancients have concealed nothing except these proportions, respecting which they give us no information. For when they speak of proportions, they bewilder the student with the most contradictory assertions. If you wish to know the truth about these proportions, you may obtain it by studying the works of Albertus, Raymond, Bacon, and Anaxagoras the Elder. You must collect your knowledge from the pages of these four writers, as one of them by himself will not afford it. Though you understand the secret of joining the four qualities together into one cohesive whole, yet the more difficult task of combining the different elements still remains to be accomplished. A proper union has to be effected between earth and water on the one hand, and air and fire on the other. Though the third and the second are the most noble of all, yet the first and the fourth cannot be excluded. Earth is the most useful element, and that of which we have the greatest need. Here lies latent the possibility of growth and the power of generation; it is the earthy litharge of our Stone. Without it there can be no generation and no fixation thereof. For there is nothing fixed save earth alone; all the other elements are volatile. Daily experience teaches you that this is true of fire, water, and air. Fire is the cause of expansion, and renders the substance capable of per-mixtion; but the transparent splendour and beautiful colour are produced through the influence of air. Moreover, when air is condensed, it produces substances which are easily melted, such as wax, butter, and gum; these are liquefied by a very slight degree of heat. Water purifies by ablution, and causes mortifying things to revive. There is nothing wonderful in the multiplication of fire, and it is greatly inferior to the power of multiplication inherent in earth. For earth daily produces fresh herbs, while one spark of fire is miraculously enlarged only when it is fed with plenty of combustible matter. Fire and earth are the only elements that are capable of multiplication, and they cause the power of multiplication inherent in our Stone. Of this earth Albertus the Great says, that among all mineral substances lithargyrium (which he describes at some length) is the most suitable for our white Elixir. We will now proceed to discuss the conjunction of the elements; and, on this point, we may lay down the following rules: (1) Combine your elements grammatically, in accordance with their own proper

rules. These rules are the principal instruments for aiding the learned in this work: for the two greatest contraries upon earth are fixedness and volatility. All the grammarians of England and France cannot skill to teach you this concord. But this Ordinal can shew you where you may learn it, namely, in the book called *De Arbore*. (2) Join them together also after the manner of the rhetorician, with purified and ornate essences. Inasmuch as your tincture must be pure and fair, take pure earth, water, fire, and air. (3) In accordance with logical methods, combine such things as admit of a true and natural union. Many learned men, by neglecting this precept, have lost all their labour and pains. (4) Combine them also arithmetically, in accordance with those subtle natural proportions, of which little was known when Boëthius wrote: "Bind together the elements by numbers." (5) Combine your elements musically, for two reasons: first, on account of melody, which is based on its own proper harmonies. Join them according to the rules which obtain in music in the proportions which produce musical consonance; for these musical proportions closely resemble the true proportions of Alchemy, at least, as far as the more general aspects of our Art are concerned. Its more subtle proportions you must learn from the writings of Raymond and Bacon. Bacon discusses them allusively in his three Epistles. Raymond expounds them more fully in his General Treatise. Many who read his words think that they understand them, but they are deceived. (6) Combine your elements also by means of Astrology, that all their operations may prosper, and that the simple, rude, and unformed substance may, in due course of time, and in the proper order of its development, be brought to perfection through the blessed influences of the Stars. (7) The science of perspective (optics) also affords much help to those who labour in our noble Art; and it is materially advanced by many other sciences, (8) as, for instance, that science which deals with the plenum and the vacuum. But, as far as this Art is concerned, we must regard as the mistress of all sciences, (9) the science of Natural Magic. Now, when the four elements have been wisely combined, and each thing ordered in its own proper degree, then we shall behold in the various stages of coction, a constantly shifting succession of colours, until perfection is attained. For the substance is wrought upon from within by the natural warmth, which is found to exist intellectually in our substance, though it can be neither seen, nor felt, nor handled. Its operation is known only to few. When this inward natural heat is stirred up by the influence of outward artificial heat, Nature, having once been roused into activity, will go on to operate, and produce the various changes which the substance has to undergo; and this is one cause, as the Sages will tell you, why so many colours are seen in our work. Many mistakes arise in the study of this Art through ignorance of the difference between outward and inward heat. In order that you may know how these two kinds of heat ought to aid and stimulate each other, and which of the two ought to predominate in our work, you should be guided by the analogy of animate creation, and more especially by the analogy of the coction which goes on in the human body. It was well said by Morienus, that the generation of our Stone exhibits a wonderful analogy to the creation of man, in whom, says Raymond, the four degrees of the four complexions are found together. On account of the close analogy which exists between the generation of man and that of our Stone, it has been said that there are in this world only two microcosms—man and our Stone.

Now, we have described the conjunction or digestion of the elements, and we proceed to give an account of the nutrition of our substance. There is a solid humour rendered firm by dryness, well mixed in all its degrees; and the passive qualities are generated in due mixture by inward and outward heat. Hence our digestion is nothing but

perfection produced out of a substantial humour. You must pardon my using these expressions, which to the unlearned must appear obscure and meaningless; but this Art of Alchemy, like all other arts and sciences, has its own proper terminology, from which it is not safe for me to depart. Digestion is sometimes quickened by outward cold, as you may see from the fact that in winter men take a larger quantity of food than in summer, when their heat is more intense. For cold drives heat inward and increases its action, giving it greater virtue and power of digestion than it had before. The digestive quality in our Art is the virtual heat of a digestive organism. Nevertheless, the warmth of a digestible substance is also instrumental in aiding digestion. Fever heat digests nothing. Baths may both aid and cause destruction. Digested (fermented) wine has more natural heat than must. Coagulation is not a substantial form, but only a passive state of some material substance. Moreover, you should know when the colours appear, that the principal agent in the substance is either heat, or cold, or moisture, or dryness. To recognise the principal agent at any given stage requires the practised eye [of](#) the Master, and a quick observation of the manner in which the colours arise. The principal agent obtains royal power over the four qualities, and during its temporary predominance assimilates them to its own nature. This change is discussed by Anaxagoras in his book entitled "Natural Conversion," and its *rationale* is also given by Raymond. The discernment of your principal agent is not by any means such a simple matter as you may suppose; I will attempt to teach it you by means of four signs or symptoms, viz., colour, taste, smell, and fluxibility. The colour of your substance may guide you in recognising its principal agent, because that colour which a glance at your vessel exhibits as predominant is caused by that quality which, for the time being, is the principal agent. Of course, you will be able to moderate any excessive action of this principal agent, if you are aware of its nature; and its nature I will now enable you to tell, by giving you an account of the causes whereby the different colours which appear in our Art are produced. Whiteness is the effect of transparency in any object. Blackness arises when the clearness of a dense body is obscured by the thickness of its constituent parts: it is produced out of an earthy substance by combustion, particularly when the heat causes a greater hardness of the atoms. By the mixture of the dense and obscure with the clear and pure, we obtain all the intermediate colours. Any clear and transparent body arises out of the substance of air and water condensed in purified earth which does not destroy their transparency. If in such clear and transparent bodies you do not perceive any special shades of colour, you may confidently conclude that they are the effect of intense cold, as is the case with the crystal, beryl, and other formations which you may thus distinguish from each other: Crystal is aeriform water, and is clear, transparent, and fair; but where the aqueous element predominates, it is more obscure, as in the case of beryl, or ice. Where the substance is essentially dry, it is dense, hard, and obscure, as may be seen in the diamond, and other substances of a like nature. In a clear substance light causes a brilliancy such as we behold in Magnesia; and a watery vapour produced by heat is instrumental in the formation of such bodies. Such are the causes of transparency, and of the extreme colours. As to the intermediate colours, that of the ruby is caused by a thin smoke in a clear body, which happens when much light and brilliancy prevail in such a body; and it is more or less brilliant in proportion to the quantity of light. The amethyst comes next in glory after the ruby, its obscurity being greater, and its transparency less; the shining substance of the chalcedony stands next to beryl. Green, or the colour of the emerald, is formed of pure water, mixed with a burned earthy substance, and the greater the transparency of the earth, the more marked is also the brilliant green of the

emerald. Yellow is generated out of water and earth, and has the clearness of air dimmed by the obscurity of black vapour. Grey, or lead colour, is the result of an union of watery and earthy elements, and where these atoms are cold and dense, the grey colour is more intense, as is seen in very old lead; or in persons at the point of death. This colour is called livid, and is frequent in men of an envious disposition. It concentrates the natural colour and the blood in the heart, for the purpose of comforting it, and leaves the face cold and dry, as it has been forsaken by its warmth and blood. In the same way, when fevers have reached an extreme point, the finger nails are of a livid hue. The colour of the sapphire is an orient blue, not unlike that of the celestial firmament, and fairer to behold than the colour of lead, because it contains more air, water, and light. Moreover, the colour of the sapphire is esteemed more precious than other shades of light blue, which are more obscure because they contain more earth and less air. Silver may easily be converted into the colour of the lazulite, because the transparency of the silver, produced by air, has a tendency to become assimilated to the colour of the sky; and the abundance of quicksilver which it contains, causes the brilliancy of the silver, while the splendour of the quicksilver, in its turn, is produced by subtle earth, pure water, and clear air. The orange colour, the shade of yellow which appears in gold, is a pleasing colour, and by many is even considered charming; it is generated by a strong and vigorous digestion, as its aqueous elements are exposed to a high degree of heat, which is seen in honey, urine, gall, and lye. The yellow colour of gold is the product of a pure and subtle water perspicuously condensed. For the more pure water is condensed, the more brilliant it becomes. The cause of a mirror is fixed humidity; and for this reason it is also smooth, because air receives no impressions, and is incapable of confining itself. It is the water which produces its clearness. If pure white and pure red be well mixed, the result is a beautiful orange colour. Thus all the different ways in which the elements may be combined, produce different colours in our substance, according to the different degrees of digestion. Observe well the proper colours of elements, that you may be the better able to judge of colours. Physicians say of certain herbs that they are cold without, and warm within at the root. If you wish for an illustration of this saying, observe the nature of fragrant violets. Common philosophy teaches us that the rose is cold within and red without. Anaxagoras says in his "Natural Changes," that the outward and the inward in all things are of a nature directly opposite to each other; and the rule holds true, except in the case of such things as are very plain and simple in their composition, as, for instance, the scammony and laurel, that do not nourish like vegetables. Bear in mind that in every mixture, one of the elements will strive to obtain the mastery. This insolent and greedy disposition is found in man, as in all things beside. But all sorts and conditions of men are placed on a footing of equality by death, which is God's means of laying low men of high degree, and of shewing the vanity of all ambitious thoughts and desires. Kings and beggars find their common level in the grave. It is thus that you must treat your principal agent, if it overleaps the proper bounds of equality. In this sense Aristotle says: "Let there be perfect equality in the composition of your Stone, in order that unprofitable strife may be avoided." Let there be all the colours which we have enumerated, in their proper order, and then suffer Nature to bring about the process of generation in her own way, till among this great variety of colours one is found to predominate, which resembles the colour you are seeking to discover. In this way you may make use of the colours for the purpose of guiding you in this work. I might say much more about colours; but what has been said constitutes a satisfactory fulfilment of my promise, and will teach you how far the various colours may be made to serve your purpose in recognising your principal

agent. Many learned men indeed will justly wonder that so great a variety of colours should appear in our Stone before the final stage of permanent and immutable whiteness is reached, seeing that the ingredients seem to be so few and simple. But I will explain the mystery in a few words: Those colours are due to the properties of magnesia, the nature of which is capable of change into any proportion and degree, just as crystal, for instance, exhibits the colour of any substance which is placed under it. Hence it is well and generously said by Hermes that "for performing the miracles of one thing, God has so ordained it that out of one thing all these marvels should spring forth." For this reason common philosophers cannot find this virtuous Stone, because it transcends their comprehension.

The sense of smell will also furnish you with indications whereby you may recognise the predominant element; and, in conjunction with the indications afforded by colour, it will teach you where to look for the principal agent. Now as white and black are the two extremes of colour, so stench and fragrance are the extremes of odour. But as fishes are incapable of distinguishing intermediate colours, because their eyes are without eye-lids and cannot be closed, so we cannot become aware of intermediate odours by the sense of smell, because our nostrils are incapable of being shut, like the eyes of fishes. On this account intermediate odours are not perceived by the nostrils as distinctly as intermediate colours are perceived by the eye. An unpleasant smell is not, in the opinion of the Sages, an intermediate smell, but only one less fetid. Yet they have noted it down in their books as the result of their experience—though I have no experimental knowledge of the fact—that if you mix a sweet and fragrant odour with one of a penetratingly fetid character, the fragrant odour alone is smelt, while the fetid one is imperceptible; and the reason which they allege is that all fragrant things are more pure and spiritual than those which are fetid, and therefore penetrate the air more easily, and, being more grateful to the living organisms and more agreeable to nature, are more readily received than fetid smells. An odour is a vaporous steam dissolved by heat, of a substance resembling an exudation, which penetrates the air freely, and affects it and your sense of smell, as your palate is affected by food, your sense of hearing by sound, and your sense of sight by colour. Four things are required for the perfect apprehension of odours. First, it is necessary that a subtle substance should be affected by the operation of heat, and give out a vaporous similitude of itself, which evaporation must then be dispersed through thin, clear air, and act on the sense of smell. But this odorous vapour is not so readily given out by dense and hard substances which, like our Stone, are not easily affected by heat. Heat quickens odours, cold hinders them; manure is more fetid in summer than in winter. Grateful odours are generated out of a pure and vaporous substance, as in the case of ambergris, nard, and myrrh, which are specially pleasing to women. A pure substance under the influence of gentle heat, gives out moderate odours, such as the fragrance of violets; but when moderate heat acts on an impure substance, the result is a disagreeable odour, such as that of aloes and sulphur. When the natural heat of the substance is diminished, the fact is signaled by a most fetid smell, such as that of decomposed fish. Where a stench is produced by the putrefaction of natural heat, it is a vapour or steam issuing from decaying matter. If the juices only are corrupted, while the substance itself is not destroyed, the stench will be extremely disagreeable, yet not so fetid as in the former case. A putrid smell is caused only by the corruption of the substance itself. When an evil substance is decomposed, it gives out a horrible smell; and putrefying carcases of human beings may often cause a pestilence. The smell of extinguished coals is destructive of health, and may occasion even a mare to miscarry.

When the qualities of a substance harmonize with your nature, the odour will be pleasant; but if the substance be of a kind that does not sympathise with your nature, you will be disagreeably affected by the odour. Fishes love sweet smells, as is seen from the fact that they are more easily attracted by a fresh than by a stale bait. All fragrant matters have a corresponding degree of natural heat; and though camphor, roses, and other cold substances emit a pleasant fragrance, yet ancient writers tell us that the purity of their substance is equivalent to, and virtually represents, natural heat. You may take for granted the truth of the old saying, that one pleasant smell does not neutralize another. It is different, however, with fetid odours; for the smell of garlic overpowers that of dung. But now we have said enough for our present purpose about smells, and you will be easily able to tell when putrefaction begins to set in. The sense of smell will also enable you to distinguish between a subtle and a gross substance. You will also have knowledge of an intermediate substance which exhibits the corruption of natural heat, and of the difference between corrupted humour and corrupted substance. But our substance has been highly purified, and is conserved by the mean virtue; wherefore, you must not expect a fetid smell to arise from it, though it putrefies after its own proper kind.

The third sign and test by which you may know your principal agent is called taste, which always causes the diminution of the substance tasted. The test of the palate would be more certain than that of the eye or the nose, if it were not dangerous to taste our Stone, seeing that it is destructive of health and life, so penetrating is its quality; hence it is inexpedient and even dangerous to taste of it too often. It strengthens metals, as we know, but it is hurtful to human beings until the perfect red colour appears, which abides the test of fire. A common labouring man, who had devoted himself to the study of this Art, tasted a small piece of the white Stone in the hope that thereby he would be delivered from all pain and disease, instead of which he was suddenly struck down with the palsy. Him my master speedily cured with mineral Bezoar. Therefore, though the palate be the best judge of the progress which has been made in our Art, yet it is of little practical use, because the taste of our substance is both horrible and hurtful. Nevertheless, certain parts may, without any risk, be tasted before they are joined together, for the purpose of discovering whether the operation has been rightly performed or not. At the same time the skilled artist will be able to discover all he wants to know by the colour and odour. Thus many judge of the quality of good wine, but new wine is best tested by the palate. For the sense of smell has only one organ, and is capable of distinguishing nothing but vaporous steam. The sense of taste, on the other hand, undoubtedly possesses six organs for the perception of material qualities. These organs Nature has ordained for the security and protection of living creatures. The ape tests the wholesomeness of his food by the sense of smell, men and parrots rely upon the verdict of the palate. For many things, though fragrant, touch the palate adversely, and repel by their acidity, bitterness, or sickly and nauseating sweetness; or they are poisonous, corrosive, or too highly seasoned. In all these cases it is unadvisable to appeal for a decision to the sense of taste. The ancient writers have distinguished nine different varieties of taste, viz., acrid, oily, and vinegary (indicative of a subtle substance), biting, salt, watery (characteristic of intermediate substances), bitter, acid, and sweet (inherent in substances of great thickness and density). These nine varieties of taste are of common occurrence: five of them are the product of heat—the oily, the acrid, the salt, the bitter, and the sweet; the remaining four are produced by cold—the sour, the acid, the watery or insipid, and the biting. Taste is determined by two things, viz., by diversities of substance, and

diversities of quality. A thick substance is generally found to have a sweet taste; a substance which is moist, thick, and warm, produces an oily taste; while a substance of an intermediate quality, which is both hot and dry, is characterised by a salt or pungent taste. A thick substance, that is both hot and dry, is intensely bitter. A subtle substance, on the other hand, which is also hot and dry, is marked by a harsh and acrid flavour. In this way heat is the source of five different varieties of taste, but not of more. That which is cold and dry in the second degree, and at the same time exhibits a subtle substance, is sour—as you may see by the face which a man makes who has tasted unripe apples. The same qualities in the same degree, united to an intermediate substance, produce, as you may easily suppose, a biting effect upon the palate, as, for instance, the rose. But the acid, less acid, and slightly acid flavours are the results of cold and dryness in different degrees. Cold and humidity in the first degree always produce a watery flavour, as is seen in the whites of eggs and in oysters; for these substances are both cold and humid, and have much superfluous moisture—for which reason they are not greatly relished by the human palate. Isaac says that there are only seven varieties of taste, because the acid and the slightly acid, though different in degree, are yet in reality one and the same flavour, and because the watery or insipid variety simply represents negation of taste. We may also speak of compound flavours, such as bitter-sweet, and others of a like kind. Thus, by means of the palate, men may distinguish substances, qualities, and degrees. But if you do not care to subject our matter to the test of the palate, you may be guided by another class of symptoms, just as in medicine we do not rely upon the signs exhibited by the urine alone, but take them in conjunction with the state of the pulse, and the general condition of the body. He would be an ignorant physician indeed who should compete his diagnosis without availing himself of everything which may help him to a knowledge of the exact nature of the disease. Thus, if you would pursue the study of our Art, you should avail yourself of the indications afforded by the four methods of observation for the purpose of forming a correct judgment. Of three of these methods we have already spoken, the fourth is the fluxibility of the liquid. The liquid is the strength of our substance, and its condition affords the most striking evidence of the progress of the work; moreover, by its means the elements are both combined and dissolved. The liquid joins together the male and the female, and causes the dead to be restored to life. The liquid purges by ablution, and is the principal nutriment of our Stone. Without liquid there is no good food; the liquid carries the aliment to all the different parts of the human living body, and it performs the same function in Alchemy. But you should well consider the purity and the quantity of all your liquids, and also their consistency or thinness: otherwise you will make little progress. Now, because our Elixir needs a twofold preparation, it exhibits more natural marvels than any other substance. Physicians say that the denser and more consistent urine is, the more humidity does it indicate; but with us the thickness betokens dryness, and that which is subtle humidity. Many liquids are needed for our Stone in accordance with its requirements. In the book entitled "The Crowd," Aristeus says: that air is invisibly enclosed in water, which lifts up the earth by its aerial potency. Pythagoras remarks that if the matter were so, it would be a most fortunate circumstance. Plato expresses himself most circumspcctly when he calls it (the liquid) "the gentle dropping of dew"; and the words are thoroughly applicable to Alchemy. But in the commonplaces of the primary philosophy it is said that condensed air is changed back into rain, and rarefied water into air. Some say that the month of May is the beginning of the year, when air is condensed into water. Others say that such water descends from the sky till the Sun enters the sign of Scorpio. Others, again, tell us that no liquids should be used that are

affected by the cold, because, as the ancient writers state, their activity is chained up by the cold. Some Sages affirm that the liquid which you should employ in preparing the Elixir is milk; another expresses himself in the following mystical words: "No liquid is sufficient for the great work but the water of Litharge, which together with the water of Azoch produces virgin's milk." Democritus, on the other hand, states that the best liquid for the preparation of our Stone is permanent water, which is naturally capable of resisting the action of fire, and of enduring its heat. Rupescissa says that aqua vitæ is the liquid required, because it is spiritual and revivifying in its nature, and because it is the quintessence which restores dead things to life (concerning this quintessence Aristotle writes in his "Book of Secrets" that all perfection is in the fifth part). Rupescissa further calls this aqua vitæ the best of all liquids, for that it renders thick and dense substances spiritual. In the works of Pythagoras you will find our aqua vitæ spoken of in different language. He himself calls it the vivifying principle, and bids us volatilize that which is fixed, and fix that which is volatile, as by this strong method of compulsion the fixed materials will become easy to melt. Others say that the best of all liquids is that which stirs up most desire and love. These are best found near islands, and in places that are washed by the ocean. Certain Sages tell us of yet another liquid which is colder than spring water, and has an icy taste; its quantity, however, is never diminished, nor is its substance consumed, though it is in a state of constant activity in the preparation of our Stone. This water is called by Democritus the "shadowless light," or "the water of the rising Sun." Hermes says that no water is of such paramount importance as the water of crude mercury; "for," he says, "this water holds the high place of being the proper water of Alchemy." Thus, ye who pursue the study of this Art, may know by means of all these liquids our Stone must be perfected. A liquid is a shifting substance, of a watery and unstable nature; and all such things are more subject to lunar influences than those of a firmer structure. Of this every initiated Artist may behold a proof in the preparation of the white Tincture. Liquids wash and purify both extreme and intermediate substances. God created liquids for the use of man and for the cleansing of all impurities. Liquids doubtless possess the power of bringing hidden impurities to the surface of a body, as those will tell you who use this simple means for the purpose of cleansing soiled clothing. Liquids comfort and refresh the parched roots of grass and trees; for all natural liquids have the power of restoring any vital juices which have been lost. Liquids are also useful for the dividing and separating of qualities, and for the resolving of substances into their smallest parts. Liquids further cause the generation of our Stone by the conjunction of many things into one. They assist the fluxibility and motion of many things. Again, you should observe how liquids are to be gained from the different substances which exist on earth. Some are derived through incision, as, for instance, the juice of the terebinth; others, by crushing, as the juice of the grape and of the olive; others again, by distillation, like water; some, by combustion, like colophony; some by dissolution, according to the manner in which women prepare lye; others are produced in other ways; while some owe their origin to natural processes, as, for instance, urine, blood, milk, and sweat. Coagulatory substances, again, are of great use and profit in the making of cheese. In these and many other ways we seek and discover liquids which may be useful to us in the preparation of our glorious Elixir, the most precious Philosopher's Stone, for which we daily bless God's name.

All the liquids that we have enumerated are of a more or less adhesive nature, with the solitary exception of quicksilver, which, though fluxible, will not adhere to any other matters but those in which it finds a sister or brother mixed of the same subtle

substance; but with any other liquid it will not mingle, though they, too, are composed of the four elements, as milk contains whey, butter, and cheese. These four elements may be separated and put together again, to the great advancement of your experiment; but the manner in which cheese, butter, and whey are obtained is a simpler subject of investigation than are the liquids which exist in our Stone. Not one of them is simple and uncompounded except water alone. Of the several liquids of our Stone you should understand also the qualities and degrees; for thus you will be able to check the various superfluous activities of the principal agent, if this agent itself be permanent and durable. If the predominant quality be dryness, you may correct it by adding, according to your requirements, a greater or less quantity of humid moisture; and in the same way you may proceed with regard to the other qualities, thus compelling the principal agent to submit to the rule of your will. By the knowledge of the diversity, contrariety, and agreement of qualities, you may judge which quality ought to predominate. You will need great wisdom in so adding and diminishing your liquids that all the ingredients are placed on an equal footing. But do not believe that there is anything which has the qualities of heat and moisture in the same degree; for all that maintain the existence of two qualities of this kind, are deceived in their opinion, whoever they be. The commonplaces of philosophy, which set forth this proposition, are not true. Have done with this idea, and let a new one take its place in your mind. For all the ancient writers who have asserted that these two qualities could exist in the same degree, have been mistaken, or they have done so simply for the purpose of preventing enquirers from discovering the secret method of tempering the elements. Hence he who does not know graduations cannot be perfect in our work, seeing that God has allotted to each thing its own proper measure. Without due measurement of time no one can sing correctly; he who errs in the measurement of time, errs in the very essence of the singer's Art—and all that err inflict a wrong on Nature. Consider also that the purer your medium is, the greater will be the perfection which arises out of it. The media embrace the most important part of the virtue and potent essences of our Art. For the solid cannot become fluxible, nor the liquid firm, in the gradual process of preparing our substance, without the help of intermediate substances which partake of the nature of both the extremes. It is thus that, by means of a treble spirit, the soul is joined to the human body; of these three spirits one is called the vital spirit, the other the natural spirit, and the third the animal spirit. Let me also tell you where these spirits dwell. The vital spirit has his habitation in the heart; the natural spirit, according to the ancient writers, abides in the liver, while the animal spirit sojourns in the brain. Now, so long as these three spirits maintain a sound state of health in the human body, the soul dwells in the body without any jarring disagreements, and life is sustained. But when these spirits are unable to abide in man, the soul is also compelled to forsake the body. For the subtle, pure, and immortal soul can never dwell with the gross body, except the spirits act as media between them. In our work we ought also to distinguish between body, soul, and spirit; and our intermediate substances are the spirit which joins the body and soul together by partaking of the nature of both. Nature has no other way of binding extremes together except by intermediate substances, and these intermediate substances (media) are of different kinds. After all these things you should also know the seven circulations of each element, which agree with the number of the seven planets, and they are known to none except by grace Divine. Certain Sages of great learning tell us that these circulations are nine in number; and perhaps it is safer for us to follow their teaching. Nevertheless, the newest inventions made by modern philosophers, whose assertions are exalted beyond the possibility of doubt, enable us to dispense with two. Some

learned men think that they may avoid every risk of a mistake if they go on in due order from fire to air, from air to water, and from water to earth, thus moving downward from that which is most exalted to that which is lowest; and they adduce in support of their assertion the alleged fact that air is the food of fire. But, believe me, this kind of circulation is nothing but one method of rectification, which tends more to separation and correction than to transmutation. Moreover, the favourite food of fire, its own proper nutriment and fuel, is not air but earth, as both fire and earth are dry, and heat depends for its very existence on dryness, while the nature of air, on the other hand, is more humid. Yet it is also true that fire cannot operate without air, since the hand of God has linked together the elements in a bond of mutual dependence, which will not suffer them to be disunited by any human contrivance or device. Of this fact you may find an illustration in trumpets, where, after the ascent of air, you may often observe a deposit of water, the occurrence of which can only be explained on the supposition of the mutually inclusive nature of the elements. But our circulation begins with fire, the most exalted of all elements, and ends with water, which of all elements is the most unlike to fire. Another circulation begins with air and ends with earth. From earth to fire, thence to pure water, thence again to fire, and after this to a 'mean, passing to earth, finally once more recurring to fire—by such circulations, the Red Tincture is perfected. Other circulations are more suitable for the production of the White Tincture. Now every circulation has its own proper time, according to the facility or difficulty of its execution. For as one planet is heavier and slower than another, so some circulations that are performed by the Sages take up a space of thirty weeks, while other circulations require a much shorter period of time; just as some planets are lighter and swifter than others. Thus, after all the gross and crude operations have been performed, our work may often still require twenty-six weeks. Ignorance of this fact has deceived many, and caused them to give up their labour at a point where the Sages are wont to begin. Other inexperienced students of this Art have imagined that it can be accomplished in forty day's. They do not know that in Art as well as in Nature everything has its own time, and its own proper method. The elephant, for instance, being a huge and unwieldy animal, extends its period of gestation over two years, and is fifty years old before it can bring forth young. Anaxagoras says, in his "Considerations," that the generation of the metals requires a thousand years, and that, in comparison to that period of time, our work occupies only a single day. You must therefore conduct your operation in a very subtle manner when you see the earth rise above the water; for as the earth which we tread with our feet supports the water, so, in our Art, you should frequently cause a gentle spring of water to well forth, in order that the same may flow softly, seeing that a violent outpour is positively hurtful. Moreover, the student of Alchemy should be aware of the effects of the seven waters, concerning which you must seek instruction in the books of others; for you cannot expect me to expound our whole system in this brief treatise.

Some think that by means of these waters they can correct all metallic imperfections, and can find the effects of the four elements; for they are confident that all requisite properties are discovered in these waters, not only for the purpose of softening hard metals, but also for hardening those which are too soft, purifying them, and rendering them malleable. For the attainment of each one of these objects, the knowledge of these waters is said to be indispensable. Otherwise our Stone would not receive its proper nourishment. The ancient writers call our Stone a microcosm; and there can be no doubt that its composition greatly resembles that of the world in which we live,

consisting as it does of elements, hot, cold, moist, and dry, hard, soft, light, and heavy, rough, smooth, fixed, volatile, and fluxible; and also because, in spite of the manifold variety of its component parts, it is not many things, but one thing. The transmutation of metals implies a change, not only of colour, but also of substance. The elements of the substance which undergoes a change must become the elements of the substance into which it is to be changed, and impress upon it their own character. All transmuted parts must be proportionately impressed in the transmuting elements, so that the thin elemented matter may permanently possess the substance of the one and the virtue of the other. As soon as a child is born, it can feed and cry; and so our Stone, when first prepared, has abundant power of imparting its colour to other substances. Again, as after three years the child walks and talks, so after a certain lapse of time, our Stone receives a still more intense power of colouring, so that it can pervade with its own glorious nature a substance of a thousand times its own size. To this fact I myself can bear witness: for many a time have I seen well-purged metals transmuted into the finest silver and gold. Thus, our Stone may go on growing in quantity, and becoming more excellent in quality, during an infinite period of time; and in this respect it bears a marvellous analogy to the birth and growth of human beings. I must, however, take this occasion to state a truth which may be displeasing to some readers. The time when you first succeed in preparing your Stone should be well and wisely used, or you may even then lose all your pains, and miss your recompense for all the heavy outlay you have undergone.

For the purpose, then, of augmenting your Stone, you should at once divide it into two equal parts, carefully testing the correctness of your division by means of the balance. One-half is for the Red Tincture, and the other moiety for the White. Then, and not till then, will you begin to reap the profits of your labours. But it will be unadvisable to stop even here, seeing that you may go on augmenting your Tincture indefinitely. Miriam, the sister of Aaron, rightly says that life is short, and knowledge long; nevertheless, our Tincture, when it has once attained to the highest perfection of its excellence, has the virtue of greatly retarding old age. Some of our Sages have been so foolish as to give up the further improvement of our Stone at a point when they might have reached the final goal with little trouble and great advantage to themselves. This supine carelessness can only be explained by assuming that they were not aware of the full virtue of that Stone; and I see that I must point out to all its fortunate owners the full extent of their possession. For when I shall have departed out of this world, this testimony will remain behind as a witness, and on this account I am not slow to reveal the secrets of the Art, so far as I may do it without prejudice to my vow. I have instructed you with sufficient clearness how to prepare the White Tincture. But when my master had declared all these things to me, he said that many students have by patient and unwearied diligence independently discovered this our White Stone and Tincture, as if they had derived their knowledge from the wisest of masters; but that scarce one in fifteen kingdoms possesses our Red Stone. With these words, he fixed upon me a steady and unfaltering gaze, and he saw that his speech had clouded my countenance with sorrow. I answered: "Alas, what shall I do? for I love knowledge far beyond all earthly wealth; moreover, the Red Tincture is said to be a most precious substance, which has the virtue of prolonging life. I should account the Red Stone a more glorious acquisition than all the gold of the whole world." He replied that I was still a young man, and that youth was prone to insolence and excess. Could I expect to be enrolled among the Sages at the immature age of twenty-eight? I must be a much older man before I could expect to have this secret unfolded to me.

"Alas, good master," I said, "though my body is still young and my years are few, I beseech you to prove me, and you will see that my mind has already attained the ripeness of mellow age." My master said no more at the time, but I soon found that he was trying and testing my character by a course of probationary training, after the manner of the Sages—of which it would be both tedious and indiscreet to publish a lengthy account. Finally, however, by the grace of God, he accounted me worthy of this wonderful proof of his love and esteem, and imparted to me the true secret of preparing the Red Tincture. To inquire into the manner of its preparation would be an aimless quest before the White Tincture has been prepared. Both Medicines are composed from the same substance, in the same vessel; and by the same methods, until the living matters have been mortified. Then the material and shape of the vessel, and the degree of chemical treatment, must be changed. But my heart beats violently, and my hands tremble, when I speak of this glorious thing. Hermes said a true word when he exclaimed: "Fire and Azoth are sufficient." The expositor of Hermes and Aristotle, in the treatise appended to their works, makes a most startling assertion, when he says that Albertus Magnus, and Bacon, the Minorite friar, had no knowledge of the manner in which the Red Stone is multiplied by augmentation. This writer was well aware what he was saying, as my master proved to me by incontrovertible arguments. I myself have never actually prepared the Red Tincture as yet, because I was disheartened by being robbed of my whole wealth of chemical materials and implements—as I set forth at length in a preceding chapter. But I understand the method of its preparation perfectly, and am able to explain it to others. Those who have ventured to unfold this grand arcanum to their disciples say that the redness of this delectable Stone is contained in its whiteness, and may be brought out, and made to appear to the Artist's ravished gaze by the gently compelling heat of fire. Pandophilus, in "The Crowd" tells us that the white Tincture is the type and shadow of the red; and Miriam confirms his words by saying that the redness is concealed in the whiteness. An admirable book entitled *Laudabile Sanctum*, ascribed to Hermes, uses the following expression of the Red Tincture: "There lies the snowy wife wedded to her red spouse." That is to say, in the white Tincture you have a beautiful woman of snowy whiteness espoused to a red husband. If your white Stone is exposed to the heat, and through the action of the fire becomes red as blood, then the marriage is valid and perfect—as in the act of copulation, if it be fruitful, the male seed obtains the ascendancy, and assimilates the female seed to its own nature. That this fact is so, those who have observed the nature of the embryo have been taught by experience. When this has been brought about, our Stone is perfected. The Sages say that it should be nourished with its own poison till it has had enough. When this has been done, you may go wherever you like, for it will defray all your expenses. Thus, then, I have expounded to you the subtle part of the work with all its appurtenances, and more I need not, cannot, and will not, reveal.

## CHAPTER VI.

With respect to concords, let me say that there should be no serious difference between those things which ought to agree. For difference produces discord, and discord would make all your labour of none effect. Whoever wishes to practise our Art, should be guided by five rules or concords. The first rule to be observed is, that the student's mind should be in perfect harmony with his work. The desire of knowing this Art should hold a dominant place in his mind; else all his labours will come to nothing. The second concord is, that he should know the difference between this Art and those who profess it. The third kind of harmony is that which should exist between the work and the instruments. The fourth concord assigns to the work the place which is most suited to its execution. The fifth concord is the sympathy which should exist between your work and the celestial sphere. I will say something about each one of these five rules, and begin with the first. Few students possess the gift of perseverance. They are in a great hurry and the work seems too long. They wish you to do violence to Nature, and the zeal of some is so much like a straw fire that at the end of six months it has quite burned down. Many change their minds after a week, some after twenty-four hours. Some believe in our Art most fervently for a month; but at the end of the month they will have nothing more to do with it. For such persons it would be better to stay their hands at once than to waste their time with the study of our Art. Let these butterflies flutter whither they will. But let us, before we put our hands to this work, learn with our hearts the truth of the saying; "Let us do everything from beginning to end strenuously, and yet softly and gently." All foolish and double-minded people must necessarily be fickle and unstable; and it is natural that simple folk, who have been stripped of all their savings by heartless impostors, should conceive a deep-seated aversion to our Art. But only men of constant and persevering minds are fitted to be students thereof. If any such man undertakes the study of this science, whether he be a layman or a priest, a merchant, a knight, an abbot, or a gentleman, he is not likely to fail of success: for his mind is in harmony with his work. The second concord to which attention must be paid in the pursuit of this Art, is the securing of fit and suitable assistants. No assistant should be chosen that is not sober, discreet, and diligent, faithful, vigilant, a keeper of secrets, and a pure liver; a man of clean hands and of a delicate touch, obedient and humbly content to carry out your orders. Such ministers alone will give close heed to your work, and secure you against all avoidable accidents. Do not imagine, however, that two or three of these will be sufficient for the completion of your experiment. If the quantity of your substance be moderate, eight such servants will be required, but if the quantity be small, the work may be done by four. Of this number, one half should be on duty, while the other half sleep, or are at church; for this experiment cannot be brought to a successful termination, unless it is continually attended to, by night as well as by day; and with the exception of the Sabbath, your men should relieve each other in the morning and in the evening. While they are on duty, they should carefully eschew every wicked word and deed; otherwise your work will most certainly be marred. For this reason your assistants ought either to be all men or all women, and persons of both sexes ought not to be set to work together. If your assistants are members of your own family, you should seek to inspire them with love for the work, and interest in its success; for nothing is more important than that the hearts of your workers should be in their work. Our third rule was, that the instruments should be of a kind suited to the labour to be performed. This rule is not fully apprehended by many students of our science. It means that the different parts of the experiment require their own proper

utensils, of a substance and shape closely adapted to the particular purpose which they are intended to serve. The divisions and separations of our substance are best carried out in small vessels; a broad vessel is required for humectation, while the process of circulation demands a vessel of still larger capacity. Those used for precipitation should be long; those which you employ for the purpose of sublimation may be both short and long, while narrow vessels, four inches high, are more appropriate in the process of correction. Some vessels are made of lead, and some of dead clay. Dead clay is that which has been carefully hardened, and having been mixed with sand and gravel, is capable of sustaining a high degree of fierce heat. Other kinds of clay burst when exposed to the fire, and you should reject vessels made of them. Other vessels, again, are made of stone, and endure the test of heat admirably; but vessels of this kind, which are both impervious to water and proof against fire, are now very rarely to be obtained in England; but where they can be had, they are invaluable for our purpose. All other vessels are made of glass, and are admirably adapted to prevent the volatile substance from escaping. In our country they are made of ashes and siliceous material, but elsewhere of little stones. The best kind of glass for our purpose is that made of cinders which have been left to glow in the hearth all night; a still harder and more durable kind is prepared out of smelted glass sherds. What has been said will guide you in selecting the most suitable kind of vessel; as to its form or shape you must consult your own common sense: it is, however, clear that you should, in this case, as in all others, strive to follow as closely as possible in the footsteps of Nature. Moreover, the size and shape of your vessel should be in proportion to the quantity of your substance, and to all the other conditions of the experiment. The general principles which should determine your choice are well laid down by Albertus Magnus in his book on "Minerals." The whole secret was disclosed in a few words by my master, when he said: "If God had not given us a vessel, His other gifts would have been nothing worth—and that vessel is glass." Some other instruments are also needed, such, for instance, as suitable furnaces. The ancients describe a special furnace for use in every stage of our Art, devised differently according to the bent of their minds. Many of these, however, are quite unsuitable, some being too broad, others too high, and others out of harmony with the requirements of Nature. Some of the furnaces described in these books may be used, but by far the greater number ought to be rejected, seeing that they are the inventions of men who only appeared to be, but were not really, Sages. Of the furnace which can be most highly recommended, you will find a pictorial representation in this volume. One which was unknown to the Ancients, I am proud to call my own invention. I set it up, in the first instance, at a very considerable outlay. But its advantages more than make good its cost. It is so constructed that sixty different chemical operations, for which divers kinds of heat are required, may be carried on in it at the same time, and a very small fire of only a foot square supplies a sufficient degree of heat for all these processes. As all may not be sure of this instrument, it has not been represented in a picture. Another furnace will serve for sixty or more glasses, each of them standing in the same degree of heat, as you may see by the picture. I have also invented another furnace, which is of great use in the work of separation, exaltation, and disjunction or division, and is most admirably adapted for the processes of ablution or purging, desiccation, and preparation. These six operations may with great ease be performed in it at the same time, and one fire suffices for them all. But it is a new invention, and I cannot afford to describe it more minutely. I might also set down a description of another furnace, which is more dangerous than all the rest. It was constructed by the Ancients for the preparation of our Magnesia; and they said that while it could not

with impunity be touched for fear of the flame which rose from the wood, yet a linen rag might be placed on it without being scorched. This ingeniously constructed furnace I was fortunate enough to re-invent, and with its aid I was enabled to perform many wonderful experiments. This furnace and its structure must remain a secret for some years longer; but let me warn you, in conclusion, to be very careful in the selection and structure of your furnace. It must be so arranged as to enable you to regulate the supply of heat, and to abate the fierceness of the flame at any moment. If a man does not understand and know the use of his tools and instruments, all his work will be done in a casual, haphazard manner, and it will be impossible for him to anticipate success with any degree of certainty. Therefore, let me once more repeat my warning: See to your instruments, and test their quality before you set about your work. The fourth rule is also most important. The experiment cannot succeed unless it be performed in a suitable place. Some places must be always dry, free from air and excess of light such as is caused by the bright rays of the sun. Others cannot be too much illuminated. The places more fitted for other parts of the work, are humid and cold. But violent draughts should be carefully avoided throughout. Hence a spot must be wisely chosen to fulfil all the requirements of the different parts of the work. The Sages tell us, in their enigmatic style, that our substance should be prepared within nine bars. Astrologers say that it is a singular mark of Divine grace if a man can find the right place for our work. For many things produce wonderful effects in some places, but are entirely barren of results in others; and opposite consequences are often produced by the same thing in different places. The explanation of these facts is to be found in the knowledge that different places are differently influenced by the celestial bodies, just as a magnet, for instance, affects a needle differently in different latitudes. For this reason the Sages have declared that some places are well, and others ill, suited to our work. But the very worst of all possible places are those which have been defiled by lechery.

The fifth rule is well known to the learned. There should exist a certain harmony between the celestial spheres and our work. Nothing on earth is so simple or so easily influenced as the elements of our Stone; and when they are being prepared they obey their own proper constellations, as the needle yields to the influence of the magnet. Let this amicable concord prevail, then, in a direct and fiery ascendent, and let your happy and favourable ascendent be in fortunate aspect with his Lord. The work should be sheltered from all adverse and evil influences; if these cannot be set aside, let them have a trine aspect. When you prepare the White Tincture, let the Moon be fortunate, as also the Lord of the Fourth House, which is the Treasure of Hidden Things, according to the old Sages. The Sixth House must be favourable for the servants. Preserve your work from all great impediments, and see that it be not affected by the adverse constellation of your Nativity. The virtue of the mover of the orb is the formal influence; the virtue of the eighth sphere is instrumental to it; the virtue of the planet is proper and special; and that of the elements is material, and embodies the working of the other agents. The first resembles the genius of the operator; the second is analogous to his hands; the third corresponds to his instruments; and the fourth answers to the substance which is prepared. Let the things on earth correspond to things in heaven, and you will obtain the Elixir, and become a great Master. Do not trust to Geomancy, which is a superstitious Art; nor to all Astrologers, because this science is secret; like that of Alchemy. Necromancy God forbids, and the Church condemns; therefore, if you wish for success, let your hands be pure from all superstitious practices. Necromancy is of the Devil, and a lying Art. God will bless

you if you give yourself wholly to the study of our own Blessed Art. In the next chapter I will speak about the regulation of the fire.

## CHAPTER VII.

Would you know the perfect Master? It is he who understands the regulation of the fire, and its degrees. Nothing will prove to you so formidable an impediment as ignorance of the regimen- of heat and fire; for our whole Art may be looked upon as being concentrated in this one thing, seeing it is all important for the proper development of our substance that the degree of heat which is brought to bear on it should be neither too great nor too small. In regard to this point many learned men have gone grievously astray. (1) The degree of heat which is employed for the scalding of pigs and geese, is that which we require for our decoction of intermediate minerals, and for the purpose of covering the Litharge with sweat. (2) The degree of heat which is sufficient for drying thin linen is good for our air in thirty operations; for the purpose of division you may employ the degree of heat used by cooks in roasting meat. (3) A similar degree of heat with a circular fire will be found useful for the separation of the dividents. (4) But for the circulation of the elements you will require white heat, which must be- maintained at an even temperature, without either increase or diminution, until the whole operation is accomplished. Moreover, there ought not to be in this fire any moisture that can be perceived by the touch, or seen with the eye. (5) There also is such a thing as a moist fire, though the expression sounds like a contradiction in terms. This fire should be used at a certain stage of the work, in order to remove the substances which adhere to the sides of the vessel. The same degree of heat is also employed to dilute thick substances. The Sages declare that, in its highest degree, it causes and generates an even dryness, and that its effect here coincides with that of dry heat in the first degree. (6) There is also another fire which is employed for the purpose of drying substances steeped in moisture. (7) Another variety of fire is that of conservation, because by its operation all things are parched up. (8) In the preparation of Magnesia we use the effusion of fire, which is full of danger, not only to the work, but also to the Master, who may even lose his life by its noxious effects. For this reason you should carefully protect your mouth, ears, eyes, and nose, as the smoke of this fire is ten times more baneful than poison. By neglecting this caution many students have sustained considerable injuries. (9) A corrosive fire answers the purpose of judiciously separating kindred elements. One moment of excess, one moment of premature diminution, may mar the labour of months. He that regulates the fire aright is worthy of being hailed as a great Master of the Fire. It is exceedingly difficult to tell the exact degree of heat which any given fire will produce; and here the sense of sight is the only reliable test. No sound or intelligible directions can be given in writing: the only schoolmistress that can impart to you a thorough knowledge of this branch of our Art is experience. It is in regard to this variety of heat that Anaxagoras says: "Nobody is all at once an accomplished Sage." (10) The next kind of heat is of a consuming fierceness. It is employed to smelt very hard minerals. It cannot be too fierce or powerful, even though it may occasionally be necessary to keep it up for some length of time. (11) The next variety of heat is that of calcination, and is used for the purging of impure metals, the essential qualities of which would be impaired by smelting. (12) The kind of heat used for sublimation comes next, and by its means volatile minerals may be sublimed. (13) The last variety of heat is the most important of all. It should be employed at the time of the projection of our Stone. But experience is a good teacher, and I will say no more, except that he who makes a mistake at this point, must begin the work over again.

I have now told you all things as plainly as if I had been describing to you the way to this or that town. I have, as it were, named every county, river, bridge, and village that has to be passed, and, with this my guide-book in his hand, a judicious traveller may easily find his way. A wise and intelligent man may, by means of this Book, discover the secret of our science; for the foolish and dull-witted it was not intended, and it will not teach them anything. Our Science is the height of earthly knowledge, and is to be attained by neither Pope nor Emperor through their rank, influence, or power, but only by virtue, and by Divine grace. Our Stone cannot be discovered or perfected unless it be sought with intense devotion. In the works of the Ancients, understood in the light of this my Ordinal, the truth of the matter is fully set forth; the present Book, in particular, was written for the purpose of resolving all your doubts; here everything is in its proper place, and nothing is wanting. Time was when I would cheerfully have paid down a thousand pounds for the contents of this volume; and this last chapter I would not have missed for three hundred pounds.

Do not wonder, Masters and Friends, that our Science is here so plainly expounded: I set pen to paper with the requirements of the common people in view. For just because the vulgar are not instructed in this knowledge, infinite wealth is annually wasted in this country, as all Sages know, and many others of all ranks are daily reduced to beggary. Study our Art, then, ye uninstructed, and scorn to abide in fatuous ignorance. It is better for you to take to this study late than never.

Let all that are benefitted by the reading of this Ordinal offer up prayers for my soul, and for the living and the dead.

In the year of our Lord 1477 this Book was begun.

Glory be to God!

Published by Eugenius Philalethes  
London  
1657

**The Chemists Key to Shut and Open: As the True Doctrine of the Corruption and Generation in Ten Brief Aphorisms, Illustrated with most plain and faithful Commentaries, out of the Pure Light of Nature: By that Judicious and Industrious Artist**

Henry Nollius

1617

[ Produced by R.A.M.S. (Restoration of Alchemical Manuscripts), 1977; The English Edition contained only X Aphorisms. The remaining five chapters are added in this Mss. Nollius also was the author of *Theoria Philosophica Hermetica* ]

---

### **To the Reader**

This book having worth enough in itself needs not my commendation, this Author in his lifetime being an eminent physician and most able Philosopher as the discourse itself can best testify.

The translator also wanted not judgment to choose what was best in his kind, nor abilities to perform, the choice being made. It is I alone that appear here as Menelaus at that feast in the Iliad, who came though not invited. I shall not endeavor to excuse myself, for I come not empty but will contribute somewhat to the collation.

The Author builds on good principles, so that his Theory is as true as it is plausible; and I presume he aimed at nothing more, leaving all particulars and their application to the industry of his readers. He is sometimes pleased to descend to examples, but to such only as are natural, and they indeed are good to teach but hard to imitate. We see not all that Nature does.

When he speaks of rain and dew I am contented to think, he means something else than what is vulgarly so called. And I doubt not but his Salt petri is something different from that which is combustibile and common. The Philosophers Dew, if I know it at all is a dry water, and their salt-peter is a most white incombustible body of a gummy aerial nature, and indeed, if my eyes have not deceived me, it is so aerial and unctuous that it will no more mingle with water than common oil will. I have for trial taken it in its gross body, and putting it in distilled rain water have digested it for

a full fortnight, without the addition of any third thing, but they would never mix, the Nitre notwithstanding many long and violent agitations of the glass, keeping still apart in the form of butter or oil more white than snow. The truth is there is no affinity between this Salt-peter and water, for it is not made of water, but of air hid and condensed in water. We see also that the air is a dry spirit and wets nothing; but the mist or vapor of the water incorporating with the air wets all things. Even so those bodies or substances which are generated of air retain the first complexion of their parents; this dry aerial humidity being predominant in them as is evident in common quicksilver and in all resinous substances, as vegetable and mineral gums which will not mix with water. But this will not be more apparent to those who know that universal gum or sperm whereof Nitre is made, which is neither Dew nor Rain, but a water and no water; that is it is a dry water whereof see D'Espagnet in the 49 the canon of his first aphoristical part. Here is the reason then why Nitre Philosophical will not dissolve in nor mix with common water; for it is a fat, oleous, airy substance, made by natural congelation of a mercurial dry humidity which separates from phlegm, as is evident in that succus vitalis and great Lunary of Lully.

Nitre then or Mercury Philosophical is to be found in 150 places, and of several complexions.

In the great Hali Cali of Nature it is congealed and in a manner crucified between two extremes, and both of them venomous and caustic. If you know how to extract it thence in the form of buter or a most white sweet oil, then the [\*\*\*], whence the Art has its name, is in your power, and D'Espagnet in his 225 canon will tell you what you have attained to.

Thus you see where the air of radical humidity is congealed; and now I must instruct you where it is a volatile and not congealed. It is so in the sperm whereof Nature immediately makes the Hali Cali, to which purpose the former author has left us a considerable maxim in his 214 canon: Rerum seminitz plurimus humidis radicalis inest; for this volatile air, which is in the seed or sperm reincrudates the fixed air which is in the Hali Cali. I say this volatile spermatic air or oil does it, and not oil of soap or salad, as some fools have dreamed; for nothing reincrudates and naturally dissolves a body but that crude sperm whereof the body was made. Most excellent in this respect is that passage in Lully Chap. XLVIII of his great testament: Quando volumes, quod siccum convertatur in humidii, cafrimus intrumuntum quod iesin aqua, quoequidus participal de humido radicali, viz. in vapore spiritus Quinta delatus est, etc. (When we wish to convert a dry thing into a moist thing, we take an agent which is in water --- one which partakes of the humid radical --- or rather in the vapor of aerial humidity disassociating it from its watery phlegm, in which the male spirit is carried). Thus Lully and now I think I have sufficiently introduced you; but if this be not enough I am afraid the whole discourse will not satisfy. I should have said much more, but that I intend shortly to publish a discourse of my own wherein I have endeavored to give some reasons for a most excellent and mysterious experience I have lately seen.

**The Authors Epistle,  
Dedicatory to his noble friend and kinsman, the Lord Wygand Heymel,  
President of Dresden, etc.**

It is no long time (my honored Lord and patron) since there came to Gueilberg in quest of me, a most learned man, a professor of Logic and a Tutor of under-graduates in a certain famous University, who did earnestly entreat me to discover unto him those principles by which he might be introduced into the true knowledge of our most secret philosophy, finding him therefore to be a person of Singular Humanity, of most excellent abilities, and (as I perceived by frequent discourse) of a most acute and discerning apprehension, I resolved to grant his request; and for that end I did purposely lead him into a dissertation or reasoning about the Generation of natural bodies, and having brought him thither I advised him to search curiously after what manner, and by what means, this great and secret, though daily, work was performed: Signifying farther unto him, that the Foundation of our Art did, next to the divine assistance, consist chiefly in the perfect knowledge of Corruption and Generation. Now, though this answer and advice of mine did nothing like this learned man, seeming in this Book-judgment to be very simple and wise; nevertheless, that which I told him is the very truth; for he that perfectly knows the ways of Generation, will easily come to be acquainted with the true menstruum of every body, which in our philosophy is the most useful and difficult matter to come by; yea, he will find out a way or Process; which if he, by a right Imitation of Nature will wisely practice, he shall out of a convenient body (dissolved first, and digested in its own most natural and proper Vinegar) perfectly extracted and attain to a most noble and precious medicine: A medicine I say, and not Gold; for the sophisters or Pseudo-Chymists, pining with an insatiable hunger after Gold, do by most covetous, chargeable and fruitless processes, infuse into their silly readers a strong desire of Gold-making, and promise them golden mountains; but Art cannot make Gold, Nature only produces substances; but how to perfect and purify imperfect metals by Nature only, and a natural way (not by adding to them, or mixing with them any extraneous substance or ingredient) and to separate and purge from them those obstructing, discordant impurities, which are the cause of their imperfection, the Philosophers do know very well.

Art, I say, cannot produce or make any substance; but how to propagate and multiply natures in their own species by transplantation and incision, he does know, but not without Nature. This I am sure of by the Light of Nature, whose only contemplation, with Gods blessing and gracious assistance has enabled me to write this short discourse of Generation, and wholly persuaded me to believe, that the sovereign true medicine must be sought and prepared, ad modum Generationis, after the same method that natural generations are performed.

Everything that nature affords for the subsistence and health of man its crude, and needs a further digestion, before it can be converted either into the substance of Man, or into a wholesome medicine: Let us consider our daily food; this grows in our gardens, is fed in our houses, and sown in our fields; but it is not turned into a blood and nutriment, before it is (after the Manner of Generation) altered, putrefied, and dissolved in our stomachs: That from this mass, so dissolved within us, the natural spirit may be extracted and communicated to the heart and the other members, for their conservation and strength, and so after other various digestions, the blood may

become Seed, and turn into that radical Balsom, by whose virtue Mankind is both preserved and propagated: What hinders them, seeing out internal vessel of putrefaction is insufficient, but we may after the same manner, by natural means and a philosophic skill, so imitate and assist Nature, that all crude bodies whatsoever, may externally (without the *Officina Ciborum*) be set to putrefy, to be digested and dissolved until their spiritual nature may (after that solution) be easily extracted or taken out of them; by which spirit so extracted, our internal, vital spirit (for the singular Harmony that is betwixt them) would be so marvelously comforted and strengthened, that by this excellent kind of assistance, it would be brought to exercise all its faculties with such effectual activity and virtue, as would quickly expel and exterminate all the enemies and disturbers of life; I mean all diseases, though never so desperate.

If we certainly knew what that is what purifies all Seeds, and how it is done, without doubt we might and would by a constant industry (God assisting us) find out and prepare medicines truly philosophical, to the great advantage and comfort of Mankind. To this purpose Chymistry serves; for by the help of this Art we know how to digest, to dissolve, to putrefy to separate the impure from the pure, and so come by most perfect medicines: And verily, so great and precious a blessing it is, that God never imparts it to any fraudulent Montebanks, nor to tyrants, nor to any impure, lazy envious persons, nor to the effeminate and idle, nor to gluttons, nor usurers, nor to any worshippers of Mammon: But in all Ages, the pious, the charitable, the liberal, the meek, the patient, and indefatigable spirit, who was a diligent observer and admirer of his works, found it out. This truth is elegantly sung and expressly taught by that famous Philosopher and Poet, the excellent Augurellus.

The greedy cheat with impure hands may not  
Attempt this Art, nor is it ever got, by the unlearned and rude: The villains mind  
To lust and softness given, it strikes stark blind,  
So the slym wandering Traitor and co. And shortly after.  
But the sage, pious Man, who still adores  
And loves his Maker, and his love implores  
Whoever joys to search the Secret cause.  
And series of his works, their love and laws,  
Let Him draw near, and joining will with strength,  
Study this Art in all her Depth and Length;  
Then grave experience shall his consort be  
Skilled in large Nature's inmost mystery.  
The knots and doubts his busy course and cares  
Will oft destruct, till time the truth declares,  
And stable Patience (though all Trials past)  
Brings the glad end and long hoped for, at last.

Give ear all you Medicasters, who hate and persecute this divine science; give ear, I say, and tell me with what conscience of honest confidence can you profess yourselves to be physicians, seeing that all Physick or Medicines are, without Chymistry, imperfect? Without that Chymistry, I say, which out of the manifested Light of Nature has its invincible grounds and canons laid down in this little book. This is the only Art, which (by supplying us, out of the Light of Nature, with convenient means and particular natures to separate the impure from the pure) will

teach us first how to heal all diseases of the Macrocosmical substances, and afterwards by examples and experiments deducted from those exterior cures, will show us the right and infallible cure of all diseases in our own bodies.

He that knows not how to heal and purge metals, how can he restore the decayed or weakened radical Balsom in Man and excite it by comfortable and concordant Medicines to perform perfectly all his appointed functions, which must necessarily be put into action, before any disease can be expelled? He that knows not what that is in Antimony, which purges Gold, how can he come by an effectual and wholesome Medicine, that will purge and out those extraneous peccant causes and humors that afflict and destroy the body of Man?

He that knows not how to fix Arsenic, to take away the corrosive nature of sublimate, to coagulate sulphureous spirits, and by a convenient specific Medicine to break and analyze stones in the greater world, will never in the body of Man allay and tame the Arsenical spirits of the Microcosmic Slat, nor take quite away the venomous indisposition of the Sulphur, nor dissolve the Stone in the bladder, and drive it out being dissolved. It is a noble safe and pious course we examine and try the force and virtues of Medicines upon the Microcosmical substances, before we apply them to our fellow creatures, and the rare fabric of Man.

This was the very consideration that moved the Ancients, who were true Philosophers, to a careful and effectual study of true Chymistry, the only genuine Philosophical Science, that by imitating Hermes, the Father and the Prince of all true and loyal Philosophers, they might find out most effectual and proper Medicines against all griefs and diseases, especially that glorious and supreme natural remedy, which is termed the Universal one, and is really without deception or exception (unless the finger of God oppose it) the most sure antidote of all diseases: For the obtaining of which sovereign Medicine, because this my treatise of Generation is no mean help. I would have it no longer concealed from the ingenious Lovers of this Art, but resolved to expose it to the Publick view, that the enemies of the truth may see and know, that our Science is grounded upon, and proceeded from the clear Light of Nature, and that all the Sons of Art may be more and more encouraged to a studious enquiry and a laborious search after the truth. If they benefit anything by this book, let them give God the glory, and lend me what further assistance they shall think fit to communicate.

Whatever it is, unto you, most noble and prudent Sir, my intimate Friend and my kinsman, I humbly do dedicate it; that you may see how willing I am to requite, in some measure, those numerous favours, which from the first day I entered upon this study, you have cheerfully conferred upon me, to this very hour. Therefore, I must entreat you to accept of this small Renumeration with your usual good will and benignity, still favorable to my endeavors, and to defend me from the calumnies and envy of the malicious, who from all parts set upon me and do defame my studies. This undeserved malignity I suffer under, will require your permanent favors and affection: And I do here solemnly promise, that I will never (God willing) do anything that shall tend to the violation of so sacred a friendship, and shall daily endeavor that we may be more and more endeared and closer united, which the only wise and good God mercifully grant, Amen! Farewell, most noble Sir, and as really do so continue still to

further the studies of Your  
Henry Nollius.

---

### **The Author's Preface to his Treatise of Generation**

Being to write of the generation of natural things, I must ingenuously confess, that I learned it not in the books of the Athenian Sophisters (he means the Schoolmen, and the followers of Aristotle; this term he borrowed from Paracelsus, for he first called them so, and writing his *Mysterium Magnum*, entitled it, *Philosophy* for the Athenians, for Aristotle's school was at Athens), but by the true Light of Nature: Neither will I borrow any thing from them, or their books, and convert it in this discourse, like a Plagiary, to my own use or Glory; for the truth is not to be found in their books, but most gross ignorance and errors, grounded upon and supported by the vain men, which opinions the credulous people esteem and cry up as the utmost bounds and Non Ultra of all wisdom and perfection.

As men are killed by fighting, so truth is lost by disputing; for while they only dispute and wrangle about Nature, every one of them in particular, and all of them in general are so filled and swollen up with a testy intolerable Pride and self worship, that each of them arrogating a kind of infallibility to his own Chimera's or monstrous conceits, does with all might and main labor to refute and demolish the airy castle and fond imaginations of the other, and by this ridiculous continued feud, they wander from the Bath and fundamentals of true knowledge, entangling themselves and too credulous posterity in an inextricable Labyrinth of quarrels and Errors, fortified with fictitious and groundless Principles never reduced to practice or trial, but merely suppose and implicitly believed, so that he would get out of this spacious and wearisome wilderness, cannot do it without much difficulty and laboriousness, and shall not do it without their general envy and opposition. Leaving therefore these lewd contenders and their verbosity, let us, the divine mercy assisting us, go directly to the house of wisdom by the Light of Nature, that by the simple and peaceable contemplation of the creatures, and her operations in them, we may truly discover and describe unto others the perfect manner of Generation, and so come not only to the certain knowledge of ourselves, but learn also how to produce and prepare out of perfect bodies and substance such a Medicine or Medicines as will innocuously and faithfully cure all diseases that are incident to our own frail bodies: For as Men, Corn and Herbs are, every one of them, generated and born out of their own Specific Seed, so or in the same manner is the true Medicine of the Ancients (than which there cannot be a better) generated and prepared out of the most perfect bodies and essence. Look not therefore with careless and transient eyes upon what is offered thee in this book, but know and be assured that this Doctrine is the most profitable and advantageous for thee, by whose Light and guidance thou will be most prosperously led to the true knowledge of the Secret generation of all Animals, Vegetables, and Minerals, and to the finding out of that rich and rare Medicine which perfectly cures all imperfect Metals.

---

### **Of the Generation of Natural Things**

To begin then: You are to know in the first place, that generation is two fold, first Ordinary and second Extraordinary. Extraordinary generation is that by which an unlike thing is generated out of dung and putrefaction by the sun. This generation is termed in the schools equivocal. The Ordinary is that by which a like thing begets his like, as when a man begets a manchild, and a lion begets a lion. This in the schools is termed univocal. This generation with the method and the means I shall include in these ten following Aphorisms or propositions.

---

## I

Everything generated or begotten is generated and born of his own specific seed (1) and in his proper (2) matrix.

*The Commentary or Illustration.*

( 1 ) Seed is a spiritual or subtile body, out of which the included spirits, by attraction of nutriment to it, forms and produces, in his proper matrix, a living body, endued with the like prolific and multiplicable seed. This very spirit is by some Philosophers termed seed, and the body in which it resides they call sperm. But while we agree about the matter I shall not quarrel about words. This seminal spirit is the most subtile essence of the seed, exalted by Nature out of some perfect body and containing in it, after the most eminent and perfect manner, all the virtues and faculties of the said body, and in a seminific power besides, which enables it, in its own species, to propagate and multiply its own body.

( 2 ) No kind of seed is of any virtue or effect, unless its be placed by Nature, or by Art, in its proper matrix (See Apor. VIII). That matrix is only proper and fostering which is naturally agreeable and ordained for the seed, according to its particular species and regimen. Therefore mineral seeds require a mineral matrix, vegetable seeds a vegetable, and animal seeds an animal matrix.

The matrix of mineral seeds are subterraneous mines, the earth is the matrix of vegetables and the female womb is the matrix of animal seeds.

---

## II

Before any perfect thing can be generated the seed mus necessarily putrefy and tehn be nourished:

*Commentary*

Believe our Savior John XII, 22, "Verily, verily I say unto you, except a corn of wheat fall into the ground and die, it abides alone; bit if it die it bringeth forth much fruit".

"Nothing can be animated and born unless it first suffer corruption, putrefaction and mortification", says Raymond Lully in his Testament, see Rosar. Philo., page 254.

Therefore say Paramenides, unless the body be dissolve and broken and putrefied and suffer a change in its substantial substance, that secret central virtue cannot be extracted nor be at liberty to mix with another body.

---

### III

The seed putrefies when a (1) salt of the same nature with it, dissolved in a convenient (2) liquor, does by the assistance of a gentle heat (3) penetrate, analyze and rarify the substance of the seed, that the included spirit may, out of its subject matter, form a convenient (4) habitation or body for itself, in which it may perform the offices of natural generation and seminal multiplication.

#### *Commentary*

( 1 ) Therefore every mineral seed requires to its purification a mineral salt and liquor; which is common water impregnated with saltpeter; and animal seeds require an animal salt and liquor, which is the female menstruum impregnated with the salt of the animal matrix. By this doctrine a passage of the most acute Philosopher Basil Valentine in his treatise of the world's great mystery, is easily understood. The words are these: "Metals and minerals must be dissolved and reduced again to their first matter by minerals, but in doing this you must in every sort of mineral consider the species or kind; for every kind mixes only with his own kind, and so yields his seed, unless you will have a monster. The virtues and propension of every seed is to join and mix itself with every thing that is within its own order or latitude; for no seed naturally applies to anything that is Extra Regnum Suum; therefore in any ordinary and lawful generation, that one like may beget another, man applies to woman, the lion to the lioness", etc.

( 2 ) Without the humour of water (says Basil Valentine, in his eighth key), true putrefaction can never be performed: For humours or liquors are the true mediums by which salt does by his dissolving and searching nature enter into and open the most intricate recesses of the seed; for when this humour or liquor is by a due degree of heat rarified and provoked, then also is the salt in it attenuated and rendered fit to pass into and open the most compacted body of the seed, and there stirs up and excites to vegetation a spirit of salt that is the like and the same with itself, which before lay hid and inactive.

( 3 ) A spirit that is at liberty will easily and quickly free another spirit of the same nature that is bound up and restrained. This is done first by reason of that activity and generability which the free spirit is imbued with, secondly by reason of the harmony, likeness and love betwixt them: This correlation is the cause that the exterior free spirit makes way into and joins with that spirit of salt included in the seed, and so does with more ease work upon him and excite him, for, as the proverb has it, like will easily go to like, and their unity is most intimate. Now you must know that very spirit, when loose and floating in liquid bodies or liquors, is at liberty in this state, by the mediation of heat, it does (like a lodestone) attract to it the spirit that is under restraint, opening and dissolving the body which holds it in; and the restrained spirit itself (like a sensible prisoner) labours for life by conspiring and striving to be in

action and a full communion with the other. The free spirit by his sudden and subtile accession still exciting and strengthening him, and by this means so provokes him to action, as fire, does enkindle fire so that the body holding it must necessarily suffer a change and calcification, and comes to be putrefied by its own included spirit, whose operation before was obstructed and kept under; for the included spirit having acquired liberty and a power to be in action from the other, strives to get out and enlarge itself, and to that end breaks and destroys its first body and procures another new one. So the spirit of salt of the earth, when it is dissolved in the unmixed humour of that element (since every salt melts in its own liquor) is then at liberty; for every salt when it is once dissolved in its own liquor becomes active. Hence it is that a corn of wheat (in whose body, as if under lock and key, the spirit of vegetable salt is bound up and fettered) as soon as it is cast into the ground, is by the free spirit of the salt of the earth penetrated and opened, that the salt which lies dissolved or loose in that liquor or inmixed humour may excite the vegetable spirit in the corn of wheat to action and vegetation, which spirit being thus set at liberty does presently, by putrefaction of the corn or grain, produce in the wheat's proper matrix the substance of the root (which is a new body) by whose mediation and deference the earth must afterwards (the spirit attracting it) communicate nutriment to the blade and the rest of this vegetable as it grows up and increases. You must observe here that this salt which conduces to the solution and opening of bodies is sometimes weak, sometimes strong. If it be weak you must strengthen it with a salt that is of the same nature and property with the seed; and the liquor which has the weak salt in it must be impregnated with it; that the solution may be more effectual and more convenient for nature in the operations. Let us consider the generation of wheat. There is in rainwater a volatile salt by solution made in the earth; but when that salt, by reason of the earth's over dryness, is not sufficient to cause a perfect and fruitful solution of the seed corn, then does the husbandman strengthen and manure his ground with muck and dung in which there is a salt of the same nature with the seed; so that when the rain descends and mixes itself with the compost or mould, there proceeds from the muck and the ground a nitrosulphureous salt which the inmixed humour of the earth imbibes or takes in, and being strengthened by it opens the most compacted and firmest seeds, whence comes a fruitful and joyful harvest. If thou desire to see the secrets of Nature now open thine eyes.

( 4 ) Seeing that the seminal virtue lurks in the most intricate recesses of the seed, and consist in the most subtile portion of the sulphureous salt, it is most clear that it cannot be exalted and multiplied but in an humour that is most eminently subtile and pure: but because the seed sown does not at the first or presently take in that subtile humour out of those places which supply it with nutriment. Therefore Nature does, before all things, take care first to produce and form those vessels in which that humour, taken afterwards out of the elements, is digested, rarified and most accurately purged, that out of the whole body when formed and perfected, she may contribute and produce the most pure seminal essence, for the conservation and the multiplication of that species which yields it; for which very reason provident Nature does, by the intervening of putrefaction, out of the seed of herbs form first the roots, and out of the roots she does afterwards shoot forth the blade, driving it, in the growth, into several sections or joints. That the humour taken out of the soil in which the seed is sown may, at the first in the root and afterwards in the herb (when grown up and flourishing) be more and more digested, and drive the seminal virtue (through all the vessels and joints) from the very root to the uppermost top branches, where, in

a matrix purposely formed for the reception of this seminal matter, a most perfect seed, and fit for the propagation of the same species, is (by the aid of the Sun heat maturing it) found and gathered. But it happens often times (and this you are concerned to know) that though Nature forms always these vessels and vehicular of the seminal progression, yet those bodies which are thus furnished, do not always yield seed; and this comes to pass because, in those bodies, the pores through which the spermatic virtue should be promoted and driven into their superficies and upper parts, are (before the seed is stirred, or can be produced) stopped up by external colds; or else by the predominant virtue of their innate fixed salt are so bound up and obstructed that the seed either cannot come to any effectual maturity and perfection, or else is wholly suppressed and shut up. An example of this we may manifestly see in the orange trees, which grow indeed in this climate as well as other plants, but in this cold region yield no fruits: Whereas in Italy and other places, which are their natural soil, they both yield and bring forth fruit to perfection. In the like manner gold and other metals which come to our hands can make no emission of their included seed, because their pores are, by the vigor and excellency of their innate fixed salt, so bound and shut up that they are wholly restrained from the effusion of seed; so that the seminal virtue in them is not at liberty to act and come forth; for which very reason the Philosophers who knew this and were willing to assist Nature, did with most happy success reduce Gold and the other metals into their first matter, that by this course they might open their pores, which by the super-eminent vigor and power of the innate fixed salt were shut up and locked, and so bring the metals to that pass and condition in which they might, with a marvelous increase and to their great benefit, yield seed and propagate: Not otherwise then when the orange trees in the Maurice garden at Cacels are all winter long cherished with an external artificial heat, which makes them put forth and bring their fruits to maturity. He that hath ears to hear let him hear.

---

#### IV

The humour or liquor which serves for putrefaction must be proportionable to that body which is to be putrefied.

##### *Commentary*

The humour must then be proportioned both for quantity and receptivity. The humour is proportioned for quantity when so much of it is taken in by the body as is sufficient for its subtilisation. It is proportioned for receptivity or the manner of reception, when the humour is not suddenly and at once, but gently and by degrees, or by little and little, taken in and drunk up by the body or seed: For a sudden imbibation of the humour cannot so conveniently vivify the seed, but causes by its sudden and unequal penetration, that some parts of the body or seed are insufficiently opened or dissolved; hence it happens that Darnel does sometimes come up instead of corn. Therefore the Philosophers advise the sons of this science to irrigate, or moisten our earth by long delay and a frequent and wearisome attrition.

---

## V

The heat which promotes this putrefaction must be so mild and temperate that the liquor in which the resolving salt lies may remain still in and about the matter, and not be laved or evaporated from it.

### *Commentary*

This must be done for two reasons: first, because the body putrefying must receive life in this liquor: second, because such a gentle heat dissolves the salt in the liquor without violence and disperses it into the matter after a natural manner that the body may now conveniently putrefy; but if the liquor were agitated by an excessive heat the matter in it would be destroyed or spoiled so that it could neither be animated nor receive such a putrefaction as is convenient for it, and therefore nothing (in this case) could be generated out of the matter. Listen to this Pamphilus! Thou that aims at the universal medicine.

---

## VI

The body putrefying must not be removed out of the matrix in which the putrefaction was begun until that which is intended be fully perfected.

### *Commentary*

Therefore when we would out of our grain of corn get a whole ear we leave it in the earth until the appointed time of harvest, and then we find the ear ripe and carry it home. Seeds (says Avicen) should not be gathered until the harvest comes.

---

## VII

The more pure the matrix is, the thing generated is by so much the more perfect and sound.

### *Commentary*

For the pure matrix (says Leschus) will yield pure fruit. Now the more pure any thing is it is so much the more perfect and durable in its kind: On the contrary the impure, it is so much the more imperfect and frail. Therefore an impure matrix, because it yields impure fruit, must necessarily also produce it weak, impermanent, and useless.

Which inconvenience being found in everything, wise men willing to assist nature, attempted to putrefy and heal the impure matrix, wherever they found it. From these attempts spring a most wise and sure experience, which taught them all impurities and extraneous natures which hindered the generation or fostering of the birth in the matrix were either by a natural or else by an artificial assistance to be removed and taken away. Now, when for the separation of subtile delitescient impurities, or the

removal of any weakness, Nature requires any help, this must be done by a judicious and discerning knowledge: But after separation, when these impurities are once excluded from the matrix and are only a hindrance to generation by their incumbrance and abode in place, then there is only required a manual operation as volution or ejection. We find a plain demonstration of this in the art of tillage or husbandry, where the infirm salt of the earth is by the sulphurous fat salt of the dung assisted and strengthened; but the stones and thistles which lie separated from the matrix and hinder its fertility only by their weight and incumbrance are, by mere handy work cast out and rooted up, that the matrix of the corn thus dressed may become and be called a fruitful field. The same method do Philosophers use in their magistracy and practice; for they do first purge their field or matrix, then they enrich or strengthen it with the Sulphur of nature: And lastly, cast in their seed, that it may be vivified and multiplied, and be turned into a most noble and effectual medicine.

---

## VIII

That matrix is only convenient and adapted to generation which permits an easy entrance to the seed.

### *Commentary*

This is to say, which receives it with ease and is no hindrance by its hardness or closeness to the entrance of the seed. Here you must know that when the matrix, by reason of hardness, is grown callous and impenetrable, it is then opened and rendered porous again by frequent agitation that it may be fitted for the conception of seed. So the husbandman do plough up first, then mattocks and afterwards harrow their green sward or untilled lands and beat every clod asunder, that by this rarefaction and dissolution, the earth may take and easily receive in the seed, and put it forth again with increase.

If thou desire to come by the secrets of God, and to use them rightly to his glory and the good of thy neighbor, then do thou, in this Philosophic task set before thine eyes the laborious and patient husbandman, and be sure to imitate him, then will God, without doubt, favor thy righteous attempts, and give that into thy possession which will perfectly satisfy all the longings of thy heart.

---

## IX

Out of that Body which is either corrupted or destroyed by strange or extraneous natures; or whose spermatic vessels are by some violence maimed or cut off no seed can be had.

### *Commentary*

It will be a very vain and unprofitable attempt for any to hope for issue or healthful seed by a man whose body and radical balsam is deprived or dried up by an excess of

aromatic wines or hot water, or by some contagious disease. Eunuchs, because their genitals are cut off, cannot propagate their own species. Let the Sons of the Science know (says the most ingenious Leschus) that it is very fruitless work to look for that in dry twigs and lopped branches which can never be found but in the green and living.

---

## X

That body which is preserved or sustains by one simple kind of nutriment is far more perfect and durable and yields more sound and perfect seeds than that which is nourished with many different kinds of nutriment.

### *Commentary*

For the nearer anything is to unity it is so much the more durable; for in unity there is no division or discord, which is the cause of corruption, and where no corruption is there is a permanent integrity and conservation. Therefore that which is nearest to unity must needs keep better and endure longer than that which is more remote. Because there is in the one less discord and more durable anything is the seed it yields is by so much the more perfect and permanent.

---

[ The English edition of this work extends only thus far. The five following chapter have never been published in English. ]

---

## XI

### **How the Fountain of the Wise Men Becomes Lead**

( 1 ) Nature uses nothing else for the generating of lead but our fountain, that is our mercuries.

( 2 ) Because she takes the full moisture of all the Elements, mixed with the heavenly vivifying Spirit of Light, and compound the same with all sort s of heterogenial, terrestrial and sulphureous moistures, and including them in the cavities of the earth, bakes them and digests the matter a long time.

( 3 ) When all is well united by purification or putrefaction, then she continues to bake it without separating the impure, until all is become a black glittering and heavy earth, out of which afterwards, with a small fire, lead is melted.

( 4 ) But his ore of lead is not the matter of the Stone of the Wise Men with which they transmute imperfect metals into Gold and Silver. Common lead has no such perfection that out of it should be prepared the white and red sulphur of the Wise Men, for in lead they are very raw and imperfect, which imperfection cannot be established but by the tincture itself.

( 5 ) Our Stone is prepared out of our fountain only, which differs very much from common lead, for our mercury is not common lead but the Father thereof.

( 6 ) And although our fountain or mercury often is called lead, yet the Wise Men always understood thereby our fountain out of which alone our elixir is prepared; because our Saturn or fountain, when it has dissolved its magnesia or earth out of which it issued, and is again coagulated together by a small fire, becomes a black heavy earth, which compound is then called the lead of the Wise Men.

( 7 ) He that can make the lead unto him the whole Art is open, for in it lies hid the Gold and Silver of the Wise Men; that is the white and red sulphur tinging all imperfect metals either into Gold or Silver.

( 8 ) Of this lead or Saturn the poets have written much, telling us that Saturn devours all his children, etc. Note this. His Sulphur consumes all that is hid in the matter enclosed in its belly, digests and concocts it to its ripeness.

( 9 ) But Jupiter, observing this, with sharp scythe cuts off the stones of his father Saturn and throws them into the sea, because the white sulphur, which in the operation appears after blackness, abolishes by his piercing power, which is here called the scythe, the strong power of the black sulphur called Saturn and throws the same into the sea. That black sulphur comes to be dissolved and changed into a sea, out of which the fair Venus is generated which is the green color.

( 10 ) Saturn endeavors to devour Jupiter or the white sulphur, but instead of him he swallows a stone which was laid before him, which he spews up again upon the mount of Helicon. There the same was erected as a monument for mortals.

( 11 ) Also our Saturn endeavors to devour the white color that appears after blackness, but the same is changed into a stone. For though Saturn devours the stone yet by continual concoction it is cast up again.

( 12 ) Our thus dissolved matter is coagulated into the stone of the Wise men, which isto dissolved again, and in this manner Saturn always devours a stone instead of Jupiter, which he spews up upon Helicon, until at length it becomes our blessed Stone which is dedicated to Wisdom.

( 13 ) Out of this our Jupiter and Latona are born Apollo and Diana. This is the last and perfect coction, in which the white and red sulphurs, that is Apollo and Diana, acquire their plusquam perfection.

( 14 ) Hence we see that our Saturn or lead is the father of all the gods, for from him come all the metals.

---

## XII

How the Fountain of the Wise Men becomes Quicksilver

### *Commentary*

( 1 ) Between our fountain and common quicksilver there is so great a sympathy. Yea such an one that by many they are counted to be but one thing. But they err, because our fountain is the Father of quicksilver and therefore differs much from common quicksilver.

( 2 ) Our fountain generates and makes alive all things. Common quicksilver destroys, corrupts and kills all.

( 3 ) Our fountain is fiery and hot. Common mercury is moist and cold.

( 4 ) Our fountain is changed by a small distillation into a spirit a fixed body, but common mercury is a mere spirit and cannot be changed into a watery spirit, but rises corporeally without alteration.

( 5 ) The extracted spirit of our fountain is fiery, sharp, penetrating and subtile, so that it can dissolve and kill all metals; but the common quicksilver cannot be made into a spirit, neither can it dissolve and kill metals: It hides them in its belly, but by a small fire it leaves them again unchanged.

( 6 ) Our Fountain dissolves, coagulates, and makes itself, without addition of any thing: None of which can common mercury do, neither can it be coagulated without addition of other species.

( 7 ) Our fountain has within it a fixed salt white and red. Yea it is all salt and issues out of a saltish cavity; but the common mercury is nothing but a running metal, and if we will make salt out of it we must putrefy and kill it.

( 8 ) Our fountain is potentially Gold and Silver, which by coction may be got out of it, which cannot be got out of common quicksilver.

( 9 ) Our fountain becomes by mere coction, without and addition, the Elixir of the Wise Men, but this cannot be expected of common mercury.

( 10 ) In our fountain are all metals potentially; because it is the seed out of which the common metals, yea quicksilver itself grows, which cannot be said of common quicksilver.

( 11 ) Our fountain in earth all sorts of stones, noble and ignoble, which common mercury cannot do.

( 12 ) Nature mixes earth with our fountain a very subtile and clean body, and includes them in the cavities of the earth, bakes and digests it like other metals until it becomes a dark, red, glittering earth, which is called the mineral or natural cinnabar, which is distilled by a small fire into running quicksilver.

( 13 ) Yea there are vapours sublimed out of the mercurial mineral or ore of cinnabar, which in cold places run together again and become mercury.

( 14 ) Thus in many places mercury is found upon the superficies of the earth which have been sublimed out of its hidden minera, and by the coldness of the night and of the heavenly dew gathered together and made running.

---

### XIII

How Our Fountain becomes known or manifested to the Wise Men.

#### *Commentary*

( 1 ) Our fountain must be prepared out of two saline substances, yet of one root, otherwise it is impossible that it pass or be acknowledged for ours.

( 2 ) These two slain substances yield by a small fire a very fiery spirit which has innumerable names.

( 3 ) When this spirit is drawn off from them they remain as dead earth behind, because they have lost their spirit by distillation.

( 4 ) But if we give the dead earth its spirit again it becomes, by a soft fire, dissolved again and a blood red liquor, which by coction becomes redder and redder, then black, and at last thick and fat.

( 5 ) The dead earth, before it is joined again with its spirit has also many names from the Wise Men, as may be seen in their writings.

( 6 ) When this spirit by due coction is once united with its body they can never be separated again.

( 7 ) Because by continued decoction they become fixt and abiding in the fire, and although they flow in the fire yet they fume not away.

( 8 ) Thus our matter has a twofold name, yet it comes from one root.

( 9 ) It is mineral and Nature has given it a mineral form, but left the same imperfect: it flows easily: It is compounded of volatile and fixed, and when they are united they purify, and then they become perfect.

( 10 ) In this operation they become all sorts of colors as black, white, red. After redness they change no more.

( 11 ) This matter after having received perfect whiteness, perfect redness and fixation, tinges all imperfect metals into the best Silver and Gold.

( 12 ) By this time our fountain is made manifest, unto which we must add that the volatile part thereof is of a very sour taste, penetrating nature, and sharp quality.

---

## XIV

Whether Our Fountain to Come to its Perfection Stands in Need of Common Gold and Silver?

### *Commentary*

( 1 ) Our Fountain cannot come to its perfection without Gold and Silver, but this Sub and Moon are not common Sun and Moon, but something else not strange to our Fountain neither against it.

( 2 ) Because that Sun and Moon which contributes to the perfection of our fountain and is first part thereof, of a double nature, white and red, the white is called Silver and the red Gold.

( 3 ) Hence it appears to be very true our fountain cannot be brought to perfection without Silver and Gold, for Gold and Silver are the fixt and permanent part thereof, which can, shall and must fix the volatile.

( 4 ) It is of that of which is sung: "By Art dissolve the fixt and after let it fly; And fix the Volatile that not it rise high".

( 5 ) It is the Gold which must be dissolved and changed into a spirit by its own spirit.

( 6 ) We cannot say so of common Gold, for where must we get the spirit of common Sol and with the same dissolve it and change it into a spirit. This is also to be understood of common Silver.

( 7 ) Therefore when we speak of Gold and Silver we always understand which are in our fountain and are innate in it.

( 8 ) The spirit of the heavenly sun, when untied with the fat moisture of the elements, by his heat fixes and coagulates, and produces a peculiar salt which appropriates to itself the virtues and qualities of the heavenly light and strives to become like its father. Hence the Wise Men have Gold, whereas in truth it is salt and has the nature of salt.

( 9 ) And yet it is but one and not a twofold salt, as if one should be Sol and the other Luna: No, it is only one salt, called either Sol or Luna after a different manner.

( 10 ) And yet it is but one and a twofold salt, as if one should be Sol and the other Luna: No, it is only one salt, called either Sol or Luna after a different manner.

( 11 ) When our salt has acquired the highest whiteness then we call it Luna, but when it comes to the highest redness then we call it Sol. Our fountain cannot subsist without this Sol or Luna, and what we say cannot be applied to common Sol and Luna.

( 12 ) And although the Wise Men want some common Gold in the fermentation of their Stone, that the same may be determinated to transmute imperfect metals into Sol, it does not therefore follow that common Sol should make perfect our Stone.

( 13 ) On the contrary our Stone rather makes perfect common Sol and Luna, because the most perfect Sol is imperfect and unfruitful without our Stone. But when it comes to be united to our Stone it becomes alive and fruitful and can communicate part of its perfection to other metals.

( 14 ) Many busy themselves in endeavors to dissolve common Gold and bring it into a true essence but in vain. It is a labour not worth once thinking on.

( 15 ) There is another solution which is true and natural, which is performed by itself, because the solvent and that which is to be dissolved in it are both of one substance. Therefore are they radically dissolved.

( 16 ) We must look after this solution and not the common, because our solvent, our Sol, and our Luna, although they seem to be together yet are but one thing and are in one substance.

( 17 ) This a fool cannot understand: As soon as he hears this he falls into errors, not only in what concerns the preparation of the matter but also in the administration of the fire, making of the oven, making of the furnace, closing the vessels and the determination of the weight.

( 18 ) The powerful virtue and operation of the light in our matter is our weight. He that does not know and understand this must certainly err.

---

## XV

How Much Our Fountain wants of its Gold and Silver to come to its Perfection

### *Commentary*

( 1 ) Nature has no weight in the generation of metals, because it has but one only matter wherein it works.

( 2 ) But in making our fountain every one is admonished to take of the weight because our fountain consists of two matters, one being the male, the other the female, in whose conjunction we must needs trouble ourselves about the weight. In joining male and female together this our fountain is borne.

( 3 ) But every weight will not serve in this work, but only that which has its due determination.

( 4 ) Know therefore that equal parts of both these matters are to be taken in the celebration of our first marriage, but in the second marriage in which the volatile is joined with the fixed the weight must be otherwise considered.

( 5 ) For the fixed part must be dissolved by the volatile and turned into water: Hence there must be more of the volatile than of the fixed in this solution and conjunction.

( 6 ) Some take ten parts of the volatile tone part of the fixt, some seven, some but three. It suffices that so much of the volatile water be taken as the solution of the fixt part requires.

( 7 ) Much water dissolves quickly, but then the coagulation which follows takes the longer; on which the ignorant, not knowing the nature of this work, fall into desperation when they perceive that the work does not coagulate in due time.

( 8 ) I have taken much water, but then after dissolution the superfluous is abstracted again, and God has blessed my work richly.

( 9 ) There is yet another way to be used in the multiplication to moisten the white and the red work, which is done by our highly rectified fountain; and here you must be very cautious. For the white you must only pour the thickness of a paper upon it, which must be often repeated until the Stone is perfectly satiated and it becomes white and red.

( 10 ) In this operation Art does not follow Nature, for Art stands in need of a certain weight but Nature is her own weight, for she takes as much as is necessary and thrusts away the rest, reserving it for other uses. Nature has nothing useless or superfluous, for what is not good for this is good for another thing.

( 11 ) Know for a conclusion tat you need take care for nothing but to acquire our fountain (unto which will not only serve you this Treatise, but also my other treatise entitled, *The Rules of Wisdom and Chemistry* with my third one called *Sanguis Naturae* which will give you sufficiently, yea abundant instruction and expositions) because this fountain comprehends the whole Philosophical work, makes the same and corrects all errors, if perhaps committed. Besides this fountain is to be highly esteemed, because we want neither fire nor furnaces nor vessel, for our fountain is all these if you understand it right.

( 12 ) Hast thou obtained this fountain then thou hast whole Nature in thy power. Thou lacking nothing, but have all things that thou desire already in thy hand, for which praise Jehovah!

Commentary by Adam McLean

---

### **Introduction**

The influence of the heavens by the will and command of God, descends from above and mixes with the virtues and properties of the Stars, and likewise in this manner is the first production of our seed.

You must not take it out of any combustible for it fights with it without being prejudiced, but is known out of a metallic root ordained by the Creator only for the generation of metals.

You must seek it in the seed of its proper nature from which nature may produce it.

Bernard Trevisan's books are writ true, right and once by circumstances to amuse souls.

The Elements are Water, Air, Earth, and Fire, which must be so applied and governed until such time they produce a soul.

We gather the four elements by a concordance of the Seven Planets.

All our work is to Congeal and Dissolve the body, and Congeal the Spirit.

God being before all things, when He was alone created one Substance, which He called the first matter and of that substance he created the Elements, and from them created all things.

Our Stone is the Quintessence of the Four Elements, separated from them and reduced into a fifth Essence, being extracted out of the body of the first matter. Nature created by God prepared with human artifice, then by the Conjunction and Union of the said elements after their perfect rectification, reduces them into a fifth, a glorious fifth Essence or Spirit called Quintessence, appearing in a glorified body which is found in one only thing created by God.

Wheresoever is found a metallic Spirit, a metallic Soul and a body metallic, there is also found infallibly Quicksilver, Sulphur and Salt, in which certainly will make a

perfect metallic body.

We gather it from the most perfect Creature upon which the Sun ever set his eyes.

St Dunstan's work, *De Occulta Philosophia E: G: I: A*, calls it the food of Angels, the heavenly Viaticum, the Bread of Life, and it is undoubtedly next under God, the true Alchochodon or giver of years, and he does not so much admire the question whether any man can die that uses it, as to think why the possessors of it should desire to live, who have these manifestations of Glory and eternity represented to their fleshly eyes.

Our Stone is made or composed of Two, Three, Four, and Fire: of Five, that is the quintessence, of Four which are the Four Elements, of Three which is of three Principle natural things, of Two which signifies double mercury, and of One which is the first principle of all things, which was produced clean and pure from the Creation of the world, fiat --- be it made.

There are Creatures created more noble than Gold and we must look [for] it where truth will find it, which so hath put in nature, and man cannot know it by sight, except he see the whole work.

Adam our first father was in his inward parts, or internal man, made according to the similitude of God of the same substance and matter which the Angels were made, though men (that the world hold great Doctors) say and tell it for truth that God made man out of a piece of mud, clay, or dust of the Earth, which is false, it was no such matter, but a quintessential Matter, which is called Earth but is no earth. Adam before his all had a far different body than what he had after, and so far different that if we should behold him as he was in his Innocency, we should admire the glory of him, and tremble at the sight, as at the sight of an Angel and such a body as our blessed Saviour brought from heaven with him, such a body shall we arise with, and with such bodies shall our souls be endued with flesh and blood. Otherwise Man would not differ from Angels, for this flesh and blood is put upon us by the Holy Ghost, that is by regeneration. I forebear to speak more of these mysteries known to few. But he that liveth to be blessed with this Art, shall glorify his Creator. Man the Microcosm or Little World, from the Stars received Spirit, from the Great World his body, and from God immediately his soul, so here is an illumination of the Blessed Trinity. Now let us say something of the production of the Great World out of nothing, when there were neither time or place, and God created a certain Chaos Invisible which the Philosophers call Hyle, the most remote matter. Out of this He made an extract or Second Matter Chaos, which the Philosophers know not by speculation, but since that matter was and is visible and tangible, in which were and are all the seeds and forms of all creatures Superior and Inferior, that ever were made. From this God divided the four Elements, in a word did make all things Celestial and Terrestrial, the Angels, Sun, Moon, and Stars. The knowledge and practice of the Philosophers upon this Chaos brought them to the knowledge of all wisdom, and from thence next [to] God, seek thou and find all wisdom, and indeed Angelical wisdom is attained by it. Incredulity is given to the world as a punishment.

He that knoweth not what he seeketh, shall not know what he shall find.

---

### Concerning the Ancient Chaos

Chaos is the first beginning of the first created from an Uncreated Being, this God omnipotent created in the beginning, but before the work of the days it was without shape and also confused. But afterwards all the most sound Philosophers nominated that Essence, the Mother and the first matter of the world, for Hilon, and Nature, in whose bosom innumerable forms lay hid, which the Omnipotent Builder, that great Spagirus, appointed in his time to break forth, for he had first included a spirit in that Undigested Matter, Chaos, who some hath affirmed ought to be called the Soul of the World, some the Form of Forms, others the Proximate Instrument of the Creator. By the benefit of this spirit so included, there is at length by the most free will of God, providing for and overlooking all things, a separation is made of the waters from the waters, by which they were divided. But it is very remarkable, that at the separation of the Chaos, there was a just division, no deperdition, but every particle of the same being full of spirit and life, they are fit for that to which they were ordained, waxing strong and vegetating.

Hence the admirable strength of things, may by the sons of men be drawn forth and become a true metamorphosis, if they artificially search and handle them according to the nature of the Chemical Art, for the true Philosophers have considered of no other Mystery than Nature itself, and a possibility of Nature, which Natural simplicity may indeed suffice those that rely on it, for Nature doth work most of all from its aptness of its own virtue and beginning, as it doth demonstrate, only needing a little help of Art.

With the Cabalists this Chaos is twofold, to wit, Intelligibles and Visibles, the one proceeding from the immediate decree of God, the other is reported or declared to proceed immediatly from the execution of the same decree.

Know further, that the point you see in the White, is put for the centre of the Earth, the whiteness doth signify the Earth itself, the crooked line signifies the flowing water, which in its own place would cover the Earth, but by the decree of the most bountiful Creator, it encompasses some part only. The white circle beset with little

black spots, signifies the Air, as the sevenfold little points of a golden color denotes the Fire.

These things being thus expounded and declared, the next consideration shall be of the seven Planets punctually compassing the Chaos. The first of these is Saturn, and therefore is placed in the ascendant, but he contains all the other planets, as the others do the rest, but in a diverse order. From hence it is known that all things are in all things, according to the true philosophical intention. But Saturn himself is feminine and melancholy, Jupiter feminine and phlegmatic and sanguine, Mars masculine and sanguine, Mercury feminine and phlegmatic, lastly the Moon feminine and melancholy.

### **Saturn the Chemical Subject in the Root of Art**

Saturn is the first of the planets far exceeding all his brethren in essence, order and dignity. He is accounted the primary son of Nature, the root of metals known to few.

Hence saith the *Clangor*, the colouring spirit is the philosopher's Mercury with its Red or White Sulphur being naturally mixed with it in the mine and bowels of the Earth, also indifferently prepared, the judgement of the artificer being left until the perfect consummation, as it is in the metaphor of Bellinus concerning the Sun, that which is the spirit is called Saturn, in plain words tincturing and dividing all metallic bodies especially gold with a true and radical dissolution, as is manifest by his words in the *Rosary*, "Know, saith he, that my father the Sun hath given me power above all power and hath clothed me with a garment of glory, and all the world seeks me and runs after me, for I am that excellent one who exalts and debases all things, and none of my servants except one can overcome me, to whom is given that which is contrary to me, and he destroys me, though not my nature, and that is Saturn who separates all my members. Afterwards I turn to my Mother who congregates all my divided and separated members".

Trevisan affirms the same thing, that no other argent vive can be extracted out of any other body, except out of the Red Servant, which is called by Bellinus, the contrary Servant. But it is called a Servant (to wit) the Servant of Nature, because it serves in the generation of Metals in her Minerals, and because it serves in Chemistry to generate that heavenly and also specified stone. It is called Red, because in this last preparation he goes into red dust. But it is termed to be contrary to the Sun, because he doth radically dissolve him and bring him into his first matter. But lest thou should err, my Son, these things are not to be understood of Saturn belonging to metals or mineral Mercury, but concerning the metalline Sun and Moon which are contained in our lead, (to wit) in potential and not visible. Pythagoras says that every secret is in lead.

That I may at length conclude in one word this golden chapter, I do plainly with a constant protestation affirm the more sound Philosophers to have nominated it the Star of the Sun, the Ens of the Moon (Sun and Mercury). Know further, that although the subject of health and riches be the same, and that we will handle them both in these commentaries, yet professedly as to the sons of learning and men of understanding it may appear in this place, we will especially treat of the matter of Medicine, for it is our chief intention. But as yet you see Saturn in the ascendant, and all the planets accompanying him, but having the Sun and Moon under his feet, by which is signified that Saturn himself only doth contain in himself those two tinctures, sought by so many and found or known to few. But that a little solar star appears in the Moon, and a little lunar star in the Sun, doth not want a Mystery, for the Sun and Moon came forth of the one and same root, as may in a short space be ocularly demonstrated by an ingenious Artificer, by the little white drops which afterwards become red is signified abundance of Tincture, lying hid especially in the body of Saturn. By the mountain out of which a flourishing tree doth appear, is very fitly signified that Saturn is not gotten elsewhere than in hilly places.

**Distillation**

After the subject was known, the first intention of the philosophers that water should be got which they had noted with many names amongst which that sharp vinegar so much spoken of by them is one. But the second is dissolving Mercury. The third is Marsh water. Dissolving Mercury is defined by a natural dissolution, and is defined by them to be that by whence metals are dissolved by a natural dissolution, and their spirits are brought from power into Action. But before they can be brought to act, Nature ought necessarily to be stirred up, but if the dissolving Mercury should be dry there would be no irritation of Nature, and so by consequence in vain would the solution be hoped for.

There are therefore some which have endeavoured to have that dissolving Mercury, or this water of those marshes, by Distillation, and it was effected. Therefore Distillation with them is the elevation of the watery vapours in the vessel, for in that are two parts of the Stone (to wit), the Superior and the Inferior. They will have the Superior part to be attenuated by Distillation, especially again when the Earth drieth and fasteneth, the Water makes clean and washeth, but the Air and Fire maketh to color.

Arnoldus says, it is necessary that there be much Water and much Air, because the multitude of the tincture will be so much as the multitude of the Air, but the Water is purging and the efficient cause of the clearness of the whole body and Medicine. Hence it is that frequent Distillation is called the most true Ablution of the Elements.

It is therefore necessary that the Stone be divided by the Four Elements and that by Distillation. First, by a light fire equally tempered and continued, water is to be gotten. Then the fire is to be made a little more vigorous and stronger, until the fire be received mixed with the fire. That which remains burned in the bottom is the dry earth where the crystalline Salt of the Stone lieth hid. Moreover, by the inferior circle, the furnace is signified. By that Red as yet beneath, the fire is signified. By the superior circle, the vessel in which the matter is put. By the cloud is signified the smoke which seems to rise like a cloud as you are distilling.

## Preparation

To prepare in this art is nothing else than to take away superfluities and supply deficiencies, because light things cannot be fixed without the company of weighty, and weighty things cannot be exalted without the consortship of light things. Neither can the hot without the consortship of the cold, the cold of the hot, the moist of the dry, the dry of the moist, the hard of the soft, the soft without the addition of the hard, be temporated or prepared. But when they are by course fitly espoused, there is generated from them a temporated substance, which the violence of the Fire cannot overcome, nor the putrefaction of the Earth vitiate, neither the limosity of the Water condensate, nor any contract, adumbrate, or overshadow.

We must know further that the preparation of the aforesaid matter is perfected by the removing of the superfluous part and the addition of the absent, by the exercise of the Four Regimens. The first of them is a reduction to the nature of the Fire. The second is a resolution into Water, and the third is a levigation into Air, and the fourth is a pressing down to the Earth or fixing. The first is by Calcining. The second is by Loosening. The third is by distilling through a still. The fourth is by Coagulating or Congealing with a light fire.

And so the whole preparation is perfected, to which purpose the Hermite did also intimate in his Smaragdine Table, saying, "it ascends from the Earth to Heaven and descends again from Heaven to Earth". And that this doctrine concerning the preparation of the Stone might be better understood, Geber testifieth most openly concerning this. Saith he, "Our art doth not consist in the plurality of things for it is one matter (to wit) of metals in which consisteth our Mystery, to which we have not added any strange thing, neither do we diminish unless that in the preparation we remove superfluity". But the other things pertaining to this Chaos are clearly enough unfolded by the second Chapter, but here it remaineth in the Water.

**Division**

Division in this art is the separation of the parts of the composition that they may be the better at length united. In which sense composition is contrary to Division, which indeed is the beginning and life of the thing, for unless there were a Composition, the thing would not be produced into a being.

Hence the cunning Son of Jazichus, the spirit will not remain in the body, neither will it be in it nor tarry any longer, until the body be subtilated, attenuated as the Spirit is. And when it is so attenuated and subtilated and does go out of his density and thickness to thinness, and from his grossness and corporeality to spirituality, then the spirit will be mingled with and drunk up in them, and so they are both become one and the same and will not be separated, as neither water mixed with water cannot be discerned, so although the Philosopher's Stone be divided into two principles (to wit) into the superior part which ascendeth, and into the inferior part which remaineth in bottom fixed, yet notwithstanding these two parts doth concord in virtue.

Therefore the materials are to be weighed and converted and divided because they are changed from a thing into a thing, as the seed of a man in the womb is in a natural preparation turned from thing to thing, until there be found a perfect man, from which was his root and beginning.

Moreover, by the Solar and Lunar stars is signified the water already gotten out of the body of Saturn. By the Sun and Moon the body of Saturn wherein the Salt yet remaineth. By the red understand the fire, by mediation whereof the aforesaid water was drawn forth.

### **Acuation**

Acuation is that by which the Stone is amended by the extraction of his proper earth, that is of the Salt, and by the mixing of the same with Sulphur and his proper Mercury.

Hence Gratianus, of every thing there may be made ashes, and of that Salt there is water, and of that water there is Mercury, and of that Mercury by diverse operations there is made Sun. He therefore that knows the Salt and its solution, knows the hidden secrets of the ancient wise men. Whosoever, therefore will alter spirits and bodies and change them from their nature, it behoveth that he first reduce them to the nature of Salts and Alums otherwise he will do nothing, then let him lave or wash those, that Sal may go forth fusible. You ought as Arnold saith to praise God, from whence also another Philosopher, put therefore thy mind on the Salt, the chief and most hidden Mystery of all the ancient Philosophers.

Moreover, by the lunar star is signified the White Salt of Saturn already gotten. By the circles, the furnace and vessels. By the compassing red, the fire, and that of Calcination, because Saturn is not gotten but first by calcining.

### **The Green Lion**

The Green Lion is that Philosophical Mercury so often spoken of in his first beginning, or flourishing, easily avoiding the fire, because it is not fixed, but being fixed it desires it, and expects it and rejoiceth in it. It is of a Cold and Airy nature, and out of it (as it is in the *Rosary*), God created all mines. Let it not therefore seem strange to anyone because it reduceth into and doth radically dissolve all metals into their first matter, when as out of him are all things, and in whose bosom are all the planets, they lie hid and are contained. Seeing therefore that some of them affecteth a sublime work to him and is a profitable spirit, and there is no thing in the world besides him, neither is there that may stand in his place, and is only profusive in the body that wants him (hence *Rosary*).

But the ancient and wise Philosophers have engendered the manner of wit (knowing) until it be a little done that he might expect the fire. It doth not cease to go above the reluctancy of the fire and is nourished with it, so that when any fixation is fastened unto him, there proceeds wonderful things and changes, because when he is changed he changeth, and his entrance appears in his sound and splendour. When

therefore it is coloured it coloureth, when it is loosed it looseth, and it doth make itself white in the twinkling of an eye, and it becomes red in succession, and it is a congregating water, milk, and strong urine, softening oil, and the father of all wonderful things. It is smoke and a cloud, and the fugitive servant accidental Mercury eating the Sun, who hath preferred himself before Gold and hath overcome, for it is generated, risen and produced out of him.

But lest thou should err, my son, know that those which understood of Mercury in the body of Philosophical Saturn and metalline, to be true. Moreover the Lion is said to be green in the threefold aspect. First in respect of his attractive power, for here the Central Sun is like to the Celestial Sun and make the world flourishing and green. Secondly, it is called the green Lion, because as yet the Gold is incomplete nor fixed in any body, and therefore is called living Gold. Thirdly, it is called a Lion by reason of its very great strength, reference being had to the Animal Lion, for as all beasts obey the lion, so all metallic bodies do give place to this living Gold.

### **Conjunction**

Conjunction in this art is a natural act of two vapours of the body and spirit, in one and the same genus but in a diverse species of actors and sufferers [actives and passives].

But lest thou should err, my Son, thou must now that the spirit is twofold (to wit) Tinctural and Preparing. The Preparing spirit dissolveth brass and extracteth it out of the body of the lodestone, and reduceth it again into the body itself. But the Tinctural spirit is beyond the body, and it is a body itself of a watery nature, but in the Elixir the tinctural spirit being masculine is the body, the woman the spirit.

Hence saith Arnold, the spirit is not altered from the body so that it should lose its spiritual virtue, but every body is altered and coloured by the spirit. Join therefore, my Son, (as it is in the Rosary thy Gabricius more beloved to thee than all thy sons, with his sister Beya, who is a cold girl, sweet and tender. Hence it is rightly gathered, that unless there should be such a copulation, there would never be a Conception, Raising,

Pregnation, or Birth. This therefore, is the direction of this disposition, which is especially assimilated to the creation of Man.

But by the circles is signified the vessels and furnace. By the Green Lion as it were but half into the vessel, is signified that one part ought to be put in after another and not altogether, as first Mercury then Salt or Oil, and these things are to be put in by little and little, after they are purified.

### **The Animal, Vegetable and Mineral Stone**

We find the Philosophers Stone to be variously defined with Philosophers in general, amongst which definitions we will at length rehearse one or other of them.

Therefore, the Stone, as Clangor hath it, is a body composed out of the first essence of metals, which first essence is indeed termed other where Argentvive reduced from the power of them into acting by the art of chemistry, the mystery of all beginnings.

Again the Philosopher's Stone is metallic matter converting the substance and forms of imperfect metals. That this conversion is not done but by its like is long ago agreed upon by all Philosophers. It is therefore necessary that the Stone be got out of a metallic matter (to wit) our Mercury in which is all that which is so sought for by the wise men, and lieth hid in our Mercury, although this Mercury may be termed threefold. From whence three principle Stones are known by philosophers, (to wit) the Mineral of the Wise men, or the Mineral, Animal, and Vegetable Stone of them, threefold in name, one in being.

Whereupon saith one of the Ancients, there are three Stones and three Salts of which the whole magistry consisteth, (to wit) Mineral, Animal, and Vegetable (Mercury is mineral; the Moon is plant, because she receiveth into herself two colours, white and red ; and the Sun is animal because he receiveth three, (to wit) constriction, white and red).

But by the tree upon the mountain on the left hand flourishing and bearing fruit, is signified his vegetability, as by the leg of a man raised out, his animality. By the third mountain upon which also a flourishing tree grows out, two things are signified. First, that Saturn is hid only in hilly places and it behoveth that he should be digged out of the Earth, which may be understood to be noted by the circle, from whence especially his minerality appears.

### **Calcination**

Calcination, as subtle witted Geber will, is the turning of a thing into dust by the fire, and by the privation of its humidity, consolidating other parts.

According to others, this Calcination is the last purgation of the Stone, the restoring of its colour, the conserving of its innate Humour, and the induction of Solution. And it is fourfold, for it is either by the desiccation of the moistness of Nature, or by reduction into the bottom of the furnace by fire, and then it is called Alcoole or a subtle powder, or by the amalgamation of familiar metals with quicksilver, by mixing metals with six parts of Mercury, or by strong waters, the spirits of the Salts of black vitriol, of sulphur and the like.

However it be, we use Calcination to mundify the part fixed, and the Earthly part of the Stone. For every calcined thing is in its kind fixed. And so the Sun and Moon are calcined with the first water philosophically, that the bodies may be opened and become spongy and subtle, that the second water may the better go in to work its work, which is to exalt the Earth into Mirable Salt by its only attractive virtue. Which second water is fire, not natural, by whose virtue the completement of this art is done.

Moreover, by the Sun here joined with the Moon, understand the body of Saturn even now to be calcined with the Philosophical water. By the bird flying from above, that in Calcination the spirit of Saturn goes downwards and remains together with the body, as in Sublimation it always goes upward, as is to be seen in the next chapter.

But by the bird or spirit flying upwards, understand dusky clouds ascending frequent indeed but moderately.

---

### **Sublimation**

Sublimation according to some is when that which is extracted into the sublime part of the vessel is stirred up and doth subsist there.

According to Geber, it is the elevation of a dry thing by the fire, with the adherency of its vessel.

Either definition is honest. We must know further, that the philosophers for four reasons made sublimation. First, that the body should be made a spirit of a subtle matter. Secondly, that the Mercury might incorporate itself with the body and become one with it. And thirdly, that the whole may become White, then Red and clean, and especially that the innate humidity of the Stone might be restored, which he had at the first lost in the bottom, and may be moved forwards and made fit for a sudden liquefaction, because the medicine ought to be a simple dust of a most subtle and pure substance, adhering out of its nature to the Argent vive or a most easy liquefaction, and hidden or secret subtilation of an easy ingression, after the manner of water, and fixed on the reluctancy of the fire, before the flight of Mercury.

---

## **Solution**

This Solution is the reduction of a dry thing into water. By this Solution metallic bodies are reduced into their first form, that is into their next matter, to wit, Mercury and Sulphur from whence they took their beginning.

Some of the Philosophers do put the matter of Solution to be twofold, to wit, by hot mud and fervent water, but others do contend that there is but only one Solution necessary in this art, which only hath and is to be done out of and with itself, and it is raw and clear without violence.

Hence saith the Philosopher --- a raw solution is better than a sodden one, a moist than a dry, a voluntary than a violent, a temperate than a swift, a fragrant than a stinking, a clean one than a thick, a black one than a red one, and therefore in every Solution we must secretly beware of the vitrification of the matter by the odours and vapours of imperfect bodies, that the force of that generative form may not be choked up with corrosives.

Therefore, saith the Philosopher "help Solution by the Moon and coagulation by the Sun".

---

## Putrefaction

Putrefaction according to some is the resolution of that which is mingled into the hot and moist by a natural putrefaction. According to others, Putrefaction, which is also termed conception or espousing in the putrefaction which is in the bottom of the glass, is the Conception of the proper and natural callidity in every moisture, under the conservation of it from another moisture going about in the glass.

Yet notwithstanding, Putrefaction is necessary in this work because there is never anything born, increasing, nor animated, except after Putrefaction because if it were not putrefied, it could not be poured forth nor loosed, and if it were not loosed, it will be brought to nothing.

But thou must know this, My Son, that the Putrefaction of the Philosophers is not sordid nor unclean, but it is a mixing of the water with the Earth, and the Earth with the water, by little and little, until the whole body is become one.

Hence Morien "in the Putrefaction of our brass, the spirits are united with the body and are dried up in it. For unless the water should be dried up with or by the Earth, the colours would not appear".

For Putrefaction is nothing else but a mortification of the moist with the dry, between whose mortification there doth appear blackness in regard of the domination of the obscure woman.

Yet the process or force of itself, to wit, of the Philosopher's Stone, is first Black, because unless it were first Black it would not be White, nor Red, because that redness is composed of Black and White. The Philosophers have called this blackness, Silver, the black Lead, the head of the Crow, and from whence it is said in *Turba*, "when thou shalt see blackness to come to that water, know then the body is melted".

---

## Conception

Thou must know, my Son, that whilst the Earth in the aforesaid blackness doth begin to retain with it some of the Argent vive, then it is termed Conception, and then the male acteth towards the female, to wit, Argent vive, with or into the Earth, and this is the reason why the Philosophers say that our Mystery is nothing else but the male and female and their conjunction. For the water beareth sway over the Argent vive, and the Earth increaseth, multiplieth, and augmenteth.

Hence again Philosophers say, "Conception and Dispousation are to digest it in the putrefaction in the bottom of the vessel, and the generation of the genitors in the air and head of the vessel, to wit, the still".

For the body does nothing except it putrefy and it cannot putrefy except with Mercury.

Therefore the Philosophers, "for with one part of the body are six and thirty parts of the water to be taken, and let putrefaction be made with moist gentle fire of hot and moist dung, and in no ways with others, so that nothing may ascend. Because if any thing should ascend a separation would partly be made, which ought not to be done, until the male and female are perfectly joined together, and one received the other, the sign whereof is the superficies in the nature of perfect solution".

---

### Impregnation

We must know that when the Earth is a little made white, there it is termed Pregnation, because then the Earth is Impregnated. For when the Earth is joined with an imperfect body, it is called Our Earth, because the Earth is the Mother of all the elements, and this is that which they term [unidentified alchemical symbol], when the Earth begins to retain with it somewhat of *Arsenic*, or Our Salt, or Argent vive, for then it is called a Conception, because the male acteth towards the female, because the Mystery of the Philosophers is nothing else but the male and female and their conjunction. Water coming to them, that is *Arsenic* or Our Salt, which increases much in the Earth and is augmented and comes out when the Earth is dealbated, then it is called a Pregnation, because the Earth having conceived goes away pregnant.

Moreover, that here and in the former Chapter, the little star formed of seven fold little pricks, becometh Red but not fully, it signifies that the matter of the Stone now shut up in the Philosophical phial, hath in some part suffered putrefaction, but it is far from a plenary mundification, which is made in the bottom of the vessel. For it ought to purge further, as is demonstrated by the thirteenth Chapter.

But whereas the Red and White is not compounded of Red and White, but of Black and White, there is no doubt but by the help of the Governor of all things, it will in short space come into perfect whiteness. But that the little star is not deprived of his blackness, appeareth by the black complements sticking to the little points and planets.

---

## Generation

Matter and form are only contained (as saith the Philosophers) by the Generation of Nature, but they understand by the matter and form, the Agent and Patient, thin and thick, Sulphur and Mercury, male and female, and by consequence know Generation.

He therefore that doth know how to choose matter well disposed and very ready to suffer, and strong to act, this man shall bring forth the more excellent and strong effect, but that the generation of the elixir might be the better done, let the artist diligently consider what things are requisite for Nature in the generation of metals, and what of art is to the generating of the Stone, that a collection being made between these things he may have, from whence he may judge, whether it be possible to generate the stone.

Thou must know, therefore, my Son, lest thou should err, that there are four things that are altogether requisite or necessary to Nature in the Generation of metals. First, to have composing principles, one whereof hath itself as the Matter, the other is the form of composing. Secondly, to have that due weight of the principles. Thirdly, a fit place is altogether required, that is a solid place, for unless the place where Nature mingleth were according to the two principles solid, the Vapours which are also termed Spirit would exhale, and the solidity of the place doth condensate or thicken those spirits already mixed, from whence it is they begin to act and suffer one towards the other, by subtilizing and separating impurities. The fourth thing requisite in the generation of metals is heat temperated, by which metals are in the end excluded and exhaled into the air.

All these things required are necessary in the art to generate the Stone, all which the artist by imitating Nature in all things, except in her weight, shall easily conceive that the Stone may be gotten. But let him take the weight from Nature necessarily as it shall be meet.

Moreover, of the diverse and intermingled colours appearing here and elsewhere, you may see from day to day in the glass vessel, whereof it is sufficient to have put you in mind, in this place.

### **Fermentation**

Fermentation with the Philosophers is the incorporation of the Animal part, the restoration of the vapour, the inspiration of the odour, the supplying of the beings, and it is double White and Red, whose ferment is the Sun, the Sun of the Sun, the Moon of the Moon. That is, the Sun is ferment to the Gold, or Red Elixir, and the Moon is ferment to the Silver, or White elixir.

But as substantial bodies, and fixed upon the fire, cannot manifest their qualities, neither do live or are lifted up of themselves, unless by the benefit of spirituality, they are first purified and vivificated, so neither can spiritual accident manifest their permanent virtue, except they are united and perpetuated with fixed bodies. For then and not before, the body inbreatheth the spirit, teaching him by vigorating, to reluct, strive or struggle against the fire, and the spirit embraceth the body teaching him to pierce through gross bodies, actually to subtilize thick ones, and to generally cure all infirmities and diseases.

But the intention of Fermentation is that the thing to be fermented should be prepared, washed, calcined, and dissolved, that it may the better be joined with the subtle work or body, that is to say, White ferment with White, and Red with Red.

Yet these things not hindering, my Son, you are to know that Fermentation doth not change the powder of the Stone into any form but his own, but it giveth savor, odour, and strength to transmute other bodies to his own nature.

But by the Toad, here understand the sphere of Saturn swelling with tincture, or his heaven to be great and impregnate therewith, and by and by ready to bring forth, which by the ejection of the four elements appeareth most plainly in the next Chapter, in the conversion of whom one after another, until they are inseparably fixed, dependeth the chief completement of this work.

---

## The Separation of the Elements

We being about to speak concerning the generation of the elements and their conjunction, by reason that one of them cannot be understood without the other, we shall handle them both together in this and the subsequent Chapter.

Therefore the separation of the elements in this art is nothing else than to separate or segregate heterogeneous (which are accidents from homogeneous (which are of the Essence of the Stone), that at length the mixture of the elements might be most pure and perfect. But the conjunction of the elements is to keep up homogeneous things, that is, those that are of the nature of the Radical Moisture.

Hence Raymond "have patience in dealbation or whitening, because here lieth much tardity".

Thou must know further, my Son, that the separation of the elements with the Philosophers is termed the conversion of them, as if to convert the elements was to make a thin body of a gross one, that is, of the body a spirit, and afterwards of the moist a dry, of water earth, and the elements are converted one into the other. But the Philosophers do prescribe such a manner of converting the body into the spirit. The earth is resolved into water, and water into air, the air into fire, but the spirit is turned into the body. This way the fire is coagulated and it becomes air, but the air is coagulated and becomes water, but the water is coagulated and becomes earth.

From whence saith Assidnus "behold elements hath met together in one nature, who when they are so impelled (that is coagulated) become friends, but when they wax thin they become enemies. Therefore convert the elements and thou shalt find what thou seeketh".

It behovest thee, therefore, first of all to mortify and exalt the Stone, that is, the body, soul and spirit, seeing that no one gains any thing in this art except he mortifieth, but mortification is by the separation of the elements, by which the effect of every element is shown.

Therefore if thou wilt make the elixir, it will be necessary that thou break this Stone into his elements, which is signified by the parts of the year, and then conjoin the elements by fire, Mercury mediating, which is the Philosopher's chiefest secret, and then this Mystery is completed, for all the art is placed in conjoining and loosing. But these separations are done as seest, my Son, Mercury mediating, for it first looseth the body and makes separation which in the meantime are conjoined by Salt and Mercury.

But here we must diligently note it is first of all Mercury, in the beginning of the work is called water, then the blackness appearing earth, then being sublimated air, and being made red is called fire.

### **The Conjunction of the Elements**

Then being sublimated with some luminary body it is termed Salt.

Then being added to the whole composed matter it is called the Spirit. And so the Earth, with Water, Air and Fire, is a body, the Salt is the life, the last watering of the only Mercury, the spirit.

It is therefore evident that the Stone consisteth of four elements, to wit, Water, Air, Fire and Earth. For in the Stone there are the Soul, the Body and Spirit, and yet but one Stone, as it is above said, behoving to loose and coagulate him again, then all the operations are contained under the Solution until the Albifaction it is sodden again, and becomes a Stone again when it is coagulated. Afterwards it is loosed again and then the solution is reiterated, until the Stone comes out like wax.

---

24 SEPARATION

25 CONIUNCTION

26 SEPARATION

27 CONIUNCTION

28 ORTUS

## Ortus [the Rising]

Ortus in this art is termed to be conjunction of the second salt or ferment, with the imperfect body prepared.

Hence Morien "we must know that the knowledge of our Mystery is likened to the creation of Man. For first there is conjunction, then conception, then pregnation, then Ortus or a springing or rising, a bringing forth, then Nutrition".

I would therefore have thee understand this one thing, because our seed is Argent vive. When the Earth is joined to an imperfect body, which is termed Our Earth, because the Earth is the Mother of all the elements, and they call it Copulation. But when the Earth begins to retain with it something of the Argent vive, then it is termed Conception, when the male acteth towards the female. But when the Earth is made white then it is called Pregnation, because it is then pregnant, and then the ferment is joined with the imperfect body until they become one in species and aspect, and then it is termed Ortus, because our Stone is then born, which is called a King by the Philosophers.

Whereupon it is said amongst them "Honour your King coming from the Fire. Crown him with a Diadem, and bring him up even to perfect age, whose Father is the Sun, his true Mother the Moon".

### Unnatural Fire or Fermentation

With the philosopher are four fires recorded, to wit, Natural, Unnatural, against Nature, and Elementary, and these fires may better be known by their complexion and compositions. For out of Mercury dissolving and conjoined in the body, there becomes another Mercury, which is called Adrop, Thick Water, Our Water, the Second Water, which is Fire, Strong Fire, Unnatural Fire. For those two, to wit, Spirit and Body, being fit and joined together according to their due proportion, out of them

this second Mercury, which we have described is made, and this is that Mercury of which it is written, that in it is whatsoever wise men seek, for the body, the soul and the Tincture are drawn from this Mercury.

But the second Mercury is moist in the vapour, not oily but gummy, of a property indifferent, subtle, easily lying the sharpness of the fire, and vanishing away in it, possessing both body and spirit in loosing remaining water in itself.

Moreover by Fermentation in this place, understand the second fermentation, because the Stone, especially the Inferior part thereof, should as yet be better prepared, washed, calcined, and dissolved, that it may yet unto a more higher and nobler degree of perfection, whereby it may the better be joined with any subtle work or body.

The little star with sevenfold little pricks appearing a colour somewhat duskish, signifies that the star, although it has suffered many alterations and hath his elements indifferently mixed, yet is far from being sufficiently mundified, seeing as yet it wanteth much purgation, as by the same blackness which it hath in putrefaction, appearing in the next Chapter. By the bird flying from above, understand the Spirit descending, the Stone putrefying temperately, and by little and little.

### **Purgation**

Moreover by the domination of the Woman who is of the Mercurial and Lunar humidity, the blackness doth as yet appear, but here it is a little diminished in quantity as in the following Chapters you may see, for by little and little it is changed from colour to colour until the blackness doth altogether vanish away, and the Stone becomes endued with the greatest whiteness, which is a sign of perfection.

By the bird flying from above, understand as you were admonished in the former Chapter.

34 CONJUNCTION

35 SEPARATION

36 CONJUNCTION

37 EXALTATION

**Exaltation**

Therefore, Exaltation is an ingenious nobiliating of the magnet or lodestone being dealbated, which is chiefly by the augmentation of the spirit, the sublimation of the Earth, the promotion of the liquefaction by the exaltation of the rectified elements, and by a lively constituting of the Fifth Essence out of them. From whom, saith the Philosophers, "when thou hast had the Water out of the Air, the Air out of the Fire, and the Fire out of the Earth, then thou mayest know that then the Stone hath lost the Water which he had at first out of the Air, after his resolution into it. For the Air and Water are contiguous elements, more light in mixing and better in operation of fire".

When the cold hath overcome the hot, the Air is turned into Water, but when the hot hath overcome the cold, the Water is turned into Air, but thou must have the Air out of the Fire by his Solution.

Moreover now you see the four elements wonderfully altered, exalted and almost fixed.

By the azure colour understand the Earth turned into Air, by the green colour the Air turned into Water, by the yellow colour Water turned into Fire, lastly by the colour somewhat brown understand the Fire to be turned into Earth. By which wonderful alteration is further signified that the Stone now draweth nigh to Fixation.

By the Pelican penetrating and wounding her own breast, from which rivers of blood do seem to flow, understand that this is spoken of the Pelican by a similitude which is called the Blood of Love, for as she doth impart her blood to her young ones, so the Stone being brought to a Quintessence by conversion into the four elements, is ready to impart his tincture to the imperfect wanting it.

Lastly in that you have in the following figure the bird of Hermes sleeping in the midst and applying himself to perpetual rest, understand the discords and hatred of enemies, that is, of the elements, are laid aside, lulled asleep by their long alterations and conversions, laid before our eyes in the former Chapters. But from the fire from above temperately cherishing the Matter, the artificer buildeth the reason of making his Athanor.

---

### Quinta Essentia

Let putrefaction and much conversion be upon him until it being well purged by sublimation he be made white. For as Marcus saith "when he has drunk his burning Mercury he passeth away and remaineth in the shadows of purgatory with many nights, but conceiveth in baths, and brought forth in the Air, then waxeth Red, goes upon the Water, and is white upon the tops, and is become White, light and airy, which first was ponderous, dry and obscure fire. For the Sun being Exalted the air waxeth hot and drieth".

But take this concerning the fifth essence in this work and Mastery, is the mixing of all the four elements, and the reduction of them into one pure substance. If therefore thou wilt see the Stone, to wit, the fifth substance by the four elements, thou must know that if every one of them do not partake of the fifth nature, the Stone cannot be united nor conjoined with a dry body.

## Fixation

Fixation in this art is when the body receives a tinctural or colouring spirit and takes away his volatility or flying, which is by frequent iteration, until it becomes ashes of everlasting duration, and the whole remains in the fire.

We must know further that fixation is always in the white, though not every fixation.

We must know moreover, that out of the perfection of fixation, the fire becomes cold, by whose benefit alone the Stone comes out fixed. When the hidden Mystery of him is made manifest, his colour is Citrine or Red, but after his first fixation in the white, there follows no error in the whole Mystery, although you proceed to the Crowning of Nature by often passing the Philosophical Wheel, and by bettering your blessed Stone by many reiterated solutions and coagulations.

Lastly, by the white circle is signified the white stone, now fixed by the red fire, whose punishment now it suffereth and feareth not, and by the vessel, which is within of an azure colour, is signified the Ethereal spirit of the Stone, which by the benefit of a cold fire doth animate the Stone.

## Projection

Projection in this art is the reduction of the fixed earth Multiplicative, or a formal substance firmly coloured, upon much of convenient matter, to the desired joy of the Artist. But because it is not well perceived, cast one pound upon a thousand, but before this moist medicine may go out, the Philosophers have noted some necessity of Ceration.

Hence speaketh Anonimous "it is better to project, now thou dost cast upon fundamentals, and fundamentals upon. My word, I will love thee, O Lord. I will have thee attend, the which reason is in Saffron. If the Saffron should be projected dry it would

colour but little, but if being loosed it be joined with a little liquor, and that little into much, it would colour infinitely. Thou shalt therefore make thy Projection so. First multiply 10 into 10 and then there will be 100, and 100 into 100 and they will be 10000, and so into infinity". But this cannot be done without Ceration, which the Wise have so defined "Ceration is the fitting of a hard and not fusible Medicine to Liquefaction by a frequent Imbibition".

Hence Morien in the *Rosary*, "the whole Mystery is nothing else than an extraction of Water out of the Earth, and a casting of Water on the Earth, until both it and the Earth putrefy, and become clean, seeing as yet the Earth to be mingled with the Water, and the Water or temperate decoction to be a little diminished, the other to increase". They all say that this was perfect Ceration, from whence they have also said further, that the Earth, when the Water is Cered, drunk up and dried with the tempered decoction of the Sun, that is, the heat, and is turned into Earth, that therein is the whole matter. For his force, as that divine Hermes speaketh, is entire if it were turned into Earth. But enough and more than enough has been said of the taking away of the Leprousy of Metals.

Of the curing of Man's body and continual health, understand these things from a few days to a longer time.

For a month every day let there be taken of this blessed powder, the quantity of a grain of mustard seed, in white wine or in any other liquor, early in the morning. It is sudorific or causing sweat, if anything be, to be sent forth by the pores. It is laxative, if anything be, to be evacuated by stool. It is diuretic, if anything be, to be driven forth by the passage of urine. But it is never vomative, as that is altogether contrary to nature.

Moreover, that I may briefly conclude, all this powder is like Ethereal fire, pleasantly consumes all the hurtful superfluities in Man's body, raising it up, rectifying, and bringing it to a just temperature and equality. Furthermore, it not only rectifieth Man's body but also reneweth the whole man, by the use thereof continued for a few weeks, Lastly, none of the three principles, to wit, of Salt, Sulphur, and Mercury, can in the least exalt itself. But presently, by one little grain, taken as aforesaid, the disease is rooted out, and a man is continued safe and sound without diseases, until the time appointed of God. Therefore to the most Mighty God be Praise, Honour and Glory, for ever and ever. Amen.

---

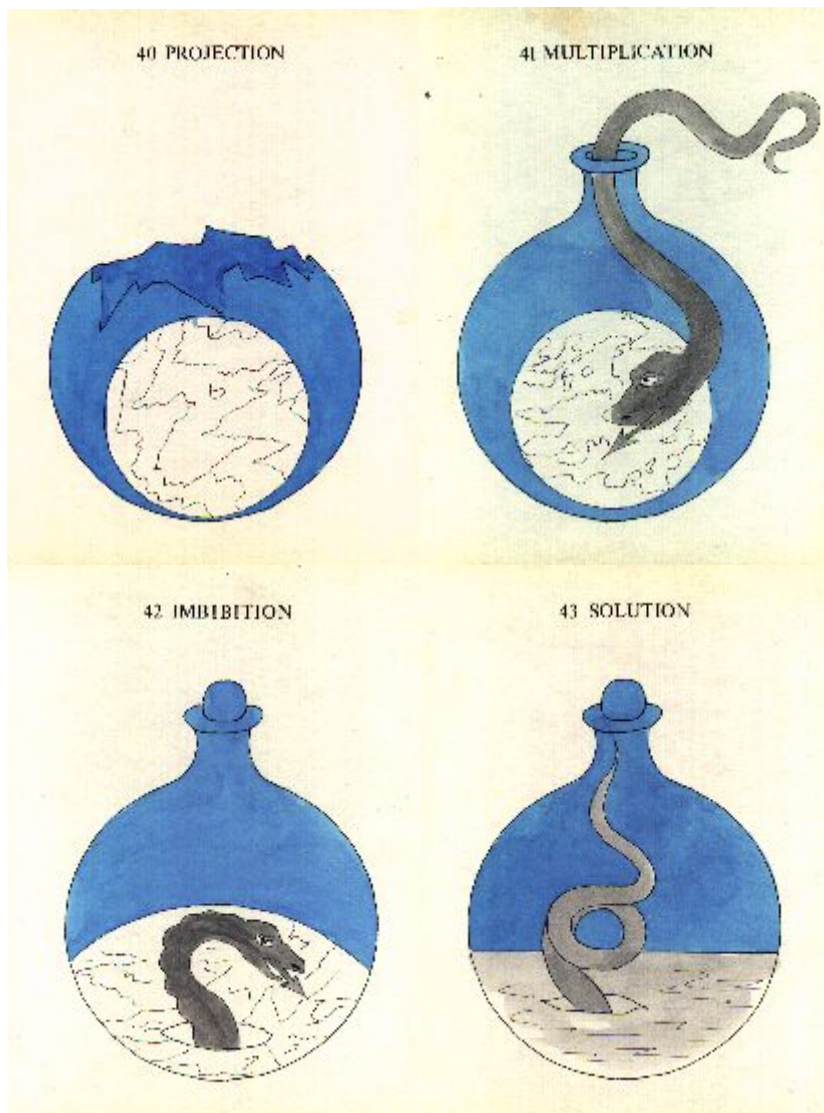

## Multiplication

In the last Chapter it is made known what it is in general, but not how many fold, but it is by two ways, to wit, quality and quantity But because the Wise have left us a perfect and known complete method concerning this doctrine of Imbibition, and of their ways of operation which follow plainly and fully the Crowning of Nature, I shall altogether give over speaking of them.

I shall add this, instead of the Crown concerning the ruling of Saturn, let a mineral be taken of the same, existing in his first being. Let it putrefy in the belly of a horse, according to the Philosophical month, to wit, 40 days. After putrefaction, by the

benefit of Distillation, let the Vinegar so often spoken of, be extracted, to radically dissolve all the metals of the Philosophers. Let that blessed produced vinegar be put upon other Saturn, who from whence may go forth into transparent redness dissolved. Let the redness be extracted and putrefied anew, for the space of a Philosophical month in a horses belly. Then in a strong vessel let it be first urged with a gentle fire, afterwards a strong fire being used, the Red Oil will go forth like blood, through a 1000 small veins. Let the dead head be reduced into Alcool, or subtle powder, calcined, and with phlegm reserved for this use, let it be drunk up and digested and evapourated. Thou shalt have then his natural Salt which if thou wilt mingle with the predicated oil and do urge back again, the red oil will go out transparent, colouring the heavenly Stone, when it hath been coloured by himself. But by the specificall Salt or Ferment, this is truth.

## BOOK ONE

### I. HISTORY AND MONUMENT

Paradoxical in its manifestations, disconcerting in its signs, the Middle Ages proposes to the sagacity of its admirers the resolution of a singular misconception. How to reconcile the unreconcilable? How to adjust the testimony of the historical facts to that of medieval art works?

The chroniclers depict this unfortunate period in the darkest colors. For several centuries there is nothing but invasions, wars, famines, epidemics. And yet the monuments ---faithful and sincere witnesses of these nebulous times ---bear no mark of such scourges. Much to the contrary they appear to have been built in the enthusiasm of a powerful inspiration of ideal and faith by a people happy to live in the midst of a flourishing and strongly organized society.

Must we doubt the veracity of historical accounts, the authenticity of the events which they report, and believe along with the popular wisdom of nations, that happy peoples have no history? Unless, without refuting en masse all of history, we prefer to discover the justification of medieval darkness in the relative lack of incidents.

Be that as it may, it remains undeniable is that all the Gothic buildings without exception reflect a serenity and expansiveness and a nobility without equal. If, in particular, we examine the expression of statues, we will quickly be edified by the peaceful character, the pure tranquility that emanates from these figures. All are calm and smiling, welcoming and innocent. Lapidary humanity, silent and well-bred. Women have that portliness which rather indicates, in their models, the excellence of rich and substantial nourishment. Children are plump, replete, and blooming. Priests, deacons, Capuchin monks, purveyor lay-brothers, clerks, and chorus singers, all show a jovial face or the pleasant figure of their portly dignity. Their interpreters ---those marvelous and modest carvers of images ---do not deceive us and could not be mistaken. They choose their prototypes from daily life among people who move around them and in the midst of whom they themselves live. A number of these figures randomly found in narrow streets, taverns, schools, sacristies, workshops, may be altogether marked or overdone, but in a picturesque tone, with a concern for character, for the sense of joy, for generous lines. Grotesque, you may say, but joyously grotesque and full of teaching. Satires of people enjoying laughter. Drinking, singing, and fond of good living. Masterpieces of a realist school, profoundly human and certain of its mastery, conscious of its means, and yet unaware of what pain, misery, oppression, or slavery might be. This is so true that, search as you may, question the ogival statuary, you will never discover a figure of Christ whose expression reveals true suffering. Along with us, you will recognize that the latomi (1) worked tremendously hard to give their crucified figures a grave physiognomy without always succeeding. The best ones, barely emaciated, have closed eyelids and seem to be resting. On our cathedrals the scenes of the Last Judgment show grimacing demons, distorted, monstrous, more comical than terrible; as far as the damned, the benumbed accursed are concerned, they are cooking in their pots over a slow heat without useless regret or genuine suffering.

These free, virile, and healthy images evidence that the artists of the Middle Ages did not know the depressing spectacle of human afflictions. Had the people suffered, had the masses moaned in misfortune, the monuments would have kept a memento of it. Yet we know that art, the higher expression of civilized humanity, can freely develop only under the cover of a stable and sure peace. As it is with science, art cannot exercise its genius in the atmosphere of troubled societies. This applies to all elevated manifestations of human thought; revolutions, wars, upheavals are disastrous to them. They demand security born of order and concord in order to grow, to bloom, and to bear fruit. Such strong reasons urge us to accept, with great circumspection, the medieval events recounted by History. We confess that the description "of a sequence of calamities, disasters, and accumulated ruins over 146 years" seems to us truly excessive. Something is inexplicable amiss here, since it is precisely during this unfortunate One Hundred Years' War, which lasted from 1337 to 1453, that the richest buildings of flamboyant style were built. It is the culminating point, the apogee of form and boldness, the marvelous phase where spirit, the divine flame, imposes its signature on the last creations of Gothic thought. It is the time where the great basilicas were completed; in religious architecture, other important collegiate or monasterial buildings were also being raised: the abbey of Solesmes, of Cluny, of Saint Riquier, the Chartreuse of Dijon, Saint-Wulfran d'Abbeville, Saint Etienne de Beauvais, etc. We see remarkable civil edifices rising from the earth, from the Hospice of Beaune to the law

courts of Rouen and the town hall of Compiègne; from the mansions built nearly everywhere by Jacques Coeur to the belfries of free cities, Bethune, Douai, Dunkerque, etc. In our big cities, the small streets dig their narrow bed under an agglomeration of cantilevered gables, turrets and balconies, sculpted wooden houses and stone dwellings with delicately ornate facades. Everywhere trades are developing under the protection of medieval corporations; everywhere guildmen vie with one another in their skill; everywhere emulation multiplies masterpieces. The university has turned out brilliant students and its renown spreads throughout the old world; famous doctors, illustrious scientists disseminate, propagate the blessings of science and philosophy; in the silence of the laboratory spagyrist amass materials which will later serve as the foundation for our modern chemistry; great Adepts give hermetic truth a new soaring flight... What ardor unfolded in all the branches of human activity! And what wealth, what fecundity, what powerful faith, what trust in the future transpire beneath this desire to build, create, search, and discover in the midst of a full-fledged invasion in this miserable country of France submitted to foreign domination and which knows all the horrors of an interminable war!

In truth, we do not understand...

And thus is elucidated the reason why our preference remains vested in the Middle Ages as it is revealed to us by Gothic buildings rather than in the same period as it is described by historians.

For it is easy to fabricate texts and documents out of nothing, old charters with warm patinas, parchments and archaic-looking seals, even a few sumptuous books of hours, annotated in their margins, beautifully illuminated with locks, borders, and miniatures. The Montmartre district of Paris delivers to whoever desires it, according to the price offered, the unknown Rembrandt or the authentic Teniers. A skilled artisan of the Halles district of Paris can shape with a staggering verve and mastery little gold Egyptian divinities and massive bronze statues, marvelous imitations over which some antique dealers fight. Who does not remember the infamous Tiara of Saitaphemes... Falsification and counterfeiting are as old as the hills, and history, which abhors chronological vacuums, sometimes had to call them to its rescue. A very learned Jesuit of the 17th century, Father Jean Hardouin, did not fear to denounce as spurious numerous Greek and Roman coins and medals coined during the Renaissance and buried with the aim to fill in large historical gaps. Anatole de Montaiglon (2) informs us that in 1639 Jacques de Bie published a folio volume with illustrations called: *The Families of France, Illustrated by the Monuments of Ancient and Modern Medals*, which, according to him, "contains more invented medals than real ones". Let us agree that in order to give history the documentation it was lacking, Jacques de Bie utilized a more rapid and more economical process than that denounced by Father Hardouin. Victor Hugo (3), citing the four best-known histories of France around 1830 ---those of Dupleix, Mezeray, Vely, and Father Daniel --says of the latter that the author, "a Jesuit famous for his descriptions of battles, completed in 20 years a history which has no other merit than erudition and in which the Count of Boulainvilliers found no less than 10,000 errors". We know that Caligula, in the year 40 AD, had the tower of Odre built near Boulogne-sur-Mer "to deceive future generations on the subject of the supposed raid of Caligula on Great Britain" (4). Converted into a lighthouse (*turris ardens*) by one of his successors, the tower of Odre collapsed in 1645. What historian can give us the reason ---superficial or profound --invoked by the sovereigns of England to justify their qualification and title of Kings of France which they kept until the 18th century? And yet English money from this period still bears the imprint of such a

(5) pretense .

Formerly, on the school benches, we were taught that the first French King was called Pharamond and the date of his accession to the throne was determined at 420 AD. Today the royal genealogy begins with Clodion le Cheveu (Clodion the Hairy) because his father, Pharamond, actually never ruled. But in those distant times of the 5th century, are we so certain of the authenticity of the documents pertaining to Clodion's doings? Will they not also be contested some day before they are relegated to the domain of legends and fables?

In Huysmans' view, history is the "most solemn of lies and the most childish of deceits... Events are for a man of talent nothing but a spring-board of ideas and style, since they are all mitigated or aggravated according to the needs of a cause or according to the temperament of the writer who handles them. As far as documents which support them are concerned, it is even worse, since none of them is irreducible and all are reviewable. If they are not just apocryphal, other no less certain documents can be unearthed later which contradict them, waiting in turn to be devalued by the unearthing of yet other no less certain archives" (6).

The tombs of historical personalities are also sources of information which is subject to controversy. We have been made aware of this fact more than once (7). In 1922, the inhabitants of Bergamo had a very unpleasant surprise. Could they believe that their local celebrity, that fiery soldier of fortune, Bartholomeo Coleoni, who filled the 15th century Italian annals with his bellicose whims, was nothing but a legendary shadow? And yet, following a hunch of the king who was visiting Bergamo, the municipality had the ornate mausoleum of the famous equestrian statue moved, had the tomb opened,

and all those in attendance discovered, not without tremendous surprise, that it was empty... In France at least we do not push offhandedness so far; authentic or not, our tombs hold bones. Amedee de Ponthieu (8) tells us that the sarcophagus of Francois Myron, magistrate of Paris in 1604, was found during the destruction of the house bearing the address 13 rue Arcole, a building raised on the foundations of the Church Sainte-Marine in which he had been buried. "The lead coffin", wrote the author, "shaped like a compressed ellipse... The epitaph had been erased. When the coffin lid was raised, only a skeleton was found surrounded by a blackish soot mixed with dust... Strangely enough, neither the insignias of his charge, nor his sword, nor his ring were discovered, not even traces of his coat of arms... Yet the Commission of Fine Arts, through the lips of its experts, declared that it was indeed the great Parisian magistrate, and these illustrious relics were taken down into the crypts of Notre-Dame". A similarly valuable account is mentioned by Fernand Boumon in his book Paris Atlas. "For your information, we shall only mention the house located on Quai des Fleurs bearing the numbers 9-11 and which an inscription, without a shadow of authenticity or even of verisimilitude, indicates it to be the ancient dwelling of Heloise and Abelard in 1118, rebuilt in 1849. Such pronouncements carved in marble are an offense to common sense". Let us promptly acknowledge that in his historical distortions, Father Loriguet showed much less boldness!

Allow us to make a digression here, intended to specify and define our thought. For a long time, a very tenacious prejudice, attributed the invention of the wheelbarrow to the scientist Pascal. And even though the falsity of this attribution has today been demonstrated, the great majority of people persist in the belief that it is founded. Question a school boy: he will answer you that this practical vehicle known to all, owes its conception to this illustrious physicist. Among the mischievous, noisy, and often distracted individualities of the little scholar world, it is above all through this supposed invention that the name of Pascal has been imposed on young minds. Many junior school students, unaware of who Descartes, Michelangelo, Denis Papin or Torricelli were, will not hesitate for a minute about Pascal. It would be interesting to know why our children, among so many admirable discoveries whose daily applications they have before their eyes, rather know Pascal and his wheelbarrow than the men of genius to whom we owe steam, the battery, beet sugar, and the stearic candle. Is it because the wheelbarrow touches them closer, interests them more, is more familiar to them? Perhaps! Be that as it may, the common mistake propagated by junior school history books could easily be unmasked: one could merely leaf through a few illuminated 13th and 14th century manuscripts where several miniatures represent medieval farmers using the wheelbarrow (9). And even without undertaking such difficult research, just a glance cast at monuments would have permitted us to reestablish the truth. Among the motifs surrounding one archivolt of the northern porch of the Beauvais Cathedral, is represented pushing his wheelbarrow, a type of wheelbarrow very similar to the ones we actually use today (Plate I) {use Image Gallery in Table of Contents to see illustrations}. The same implement can also be identified in agricultural scenes that form the subject of two carved misericords, coming from the stalls of the Abbey of Saint-Lucien near Beauvais (1492-1500)(10). Furthermore, if truth compels us to refuse to credit Pascal with a very old invention, older than his birth by several centuries, his greatness and the power of his genius are in no way diminished. The immortal author of the *Pensees*, of the calculus of probabilities, the inventor of the hydraulic press, of the calculating machine, etc., forces our admiration by works and inventions much greater and of a different scope than that of the wheelbarrow. However, that which is of consequence to elicit and that only counts for us is that, in the search for truth, it is preferable to call upon buildings rather than upon historical documents, sometimes incomplete, often tendentious, almost always unreliable.

Monsieur Andre Geiger comes to a parallel conclusion when, struck by the inexplicable homage rendered to the statue of Nero by Hadrian, he refutes the iniquitous accusations borne against this emperor and against Tiberius. Like ourselves, he denies and credibility to purposefully falsified historical accounts, on the subject of these so-called human monsters and he does not hesitate to write: "I trust monuments and logic more than I trust historical accounts".

If, as we have said, the falsification of a text, the writing of a chronicle demand nothing more than some skill and know-how, on the other hand, it is impossible to build a cathedral. Let us therefore call upon buildings; they will provide us with more serious or accurate information. There, at least, we will see our "characters portrayed alive", fixed in stone or wood with their real physiognomies, their costumes and their gestures, whether they figure in sacred scenes or are the subjects of secular compositions. We shall contact them and it will not be long before we love them. Now we will question the 13th century harvester who is sharpening his scythe on the portal of Paris, now the 15th century apothecary who, in the stalls of Amiens, is pounding some unknown drug in his wooden mortar. His neighbor, the drunkard with the red nose, is no stranger to us; we remember having met this merry drinker several times, as we ambled along. Would he not be the man who cried out in the middle of the "mystery play" before the sight of Jesus' miracle at the wedding of Cana:

"If I could do what he is doing, the entire sea of Galilee today would be turned into wine; And never on earth would there be a drop of water, nothing would rain from the sky but wine". And this beggar who escaped from the Cour des Miracles (11) bearing no other stigma of distress than his rags and his lice, we know him too. He is the one that the Companions of the Passion introduce at the feet of Christ and who miserable utters this soliloquy:

"I look at my rags to see if some money has been thrown there; Just now I heard: Give him, give! ---There isn't a penny, not even a half... a poor man has no friend".

In spite of all that has been written, we ought to accustom ourselves, willy-nilly, to the true fact that at the beginning of the Middle Ages society was already reaching a high degree of civilization and splendor. John of Salisbury, who visited Paris in 1176, expressed the most sincere enthusiasm on this topic in his *Polycraticon*. "When I saw the abundance of sustenance, the cheerfulness of the people, the good conduct of the clergy, the majesty and glory of the entire Church, the diverse occupations of men dedicated to the study of philosophy; it seemed to me that I saw Jacob's ladder whose top reached heaven and which angels ascended and descended. I was compelled to admit that truly the Lord was in this place and that I did not know it. This sentence from a poet also comes to mind: 'Happy is he who is sentenced to this place in exile!'" (12).

## II. MIDDLE AGES AND RENAISSANCE

No one disputes today the high value of medieval works. But who will ever logically explain the strange contempt whose victims they were until the 19th century? Who will tell us why, since the Renaissance, the elite of the artists, scientists, and thinkers made a special point of airing the most complete indifference for the bold creations of this misunderstood period, original among all, and so magnificently expressive of the genius of France? What was, what could have been, the profound cause of the reverse of opinion, and later, of the banishment, the exclusion that so long weighed on Gothic art? Must we indict ignorance, whim, perversion of taste? We do not know. A French writer, Charles de Remusat believes he has discovered the principal reason of this unfair contempt in the absence of literature, which does not fail to surprise. "The Renaissance", he affirms, "despised the Middle Ages because true French literature, that which followed it, erased the last traces of it. And yet medieval France offers a striking sight. Its genius was elevated and severe. It took pleasure in deep meditations and profound research; it exposed in a language without grace and without brilliance sublime truths and subtle hypotheses. It produced a singularly philosophical literature. This literature probably exercised the human spirit more than it served it. Several first rate men have successfully, albeit in vain, illustrated it; for modern generations their works do not exist. They had the intelligence and the ideas but not the talent to speak well in a language that is not stiff or awkward. Scotus Erigena reminds us at times of Plato; scarcely anyone has taken philosophical freedom farther than he, and he boldly rises in this region of the skies where truth shines only in bolts like lightning; he thought for himself in the 9th century. St. Anselm is an original metaphysician whose learned idealism regenerates common beliefs; he conceived and realized the audacious thought of directly touching the notion of divinity. He is a theologian of pure reason. St. Bernard is sometimes brilliant and ingenious, sometimes somber and moving. Mystical like Fenelon, he resembles an effective and popular Bossuet, who dominated his epoch by his speech and who commanded kings rather than praising or serving them. His unfortunate rival, his noble victim, Abelard, employed in the exposition of dialectic science and unknown rigor and a relative lucidity which shows a nervous and supple mind made to understand and explain everything. He was a great propagator of ideas. Heloise molded a dry and pedantic language so as to bring out the finesse of a brilliant intelligence, the sufferings of the proudest and most tender of souls, the raptures of a desperate passion. John of Salisbury is a clairvoyant critic, who watches the human mind as a sight or scene and who describes it in its progresses, in its movements, in its retrogressions, with premature truth and impartiality. It seems he foresaw this talent of our time, this art of examining the standstill postures of the intellectual society in order to judge it. St Thomas, embracing the entire philosophy of his time as a whole, went farther at times than ours; he has bound all of human knowledge into a perpetual syllogism and completely unwound it following the thread of a continuous reasoning, thus combing in a vast and a logical mind. Gerson finally, Gerson, theologian whose sentiments competed with deduction, who understood and neglected philosophy, knew how to subdue reason without humiliating it, how to captivate hearts without offending minds, finally how to imitate the God who invokes faith while he has us believe in him by making himself loved. All these men, and I named only a few, were great and their works admirable. But what were they lacking, to be admired and to keep a constant influence on the ensuing literature? It was neither science, thought, nor genius; I am afraid that it was only one thing: style.

"French literature does not come from them. It does not call to their authority, nor does it remember their names; it only takes pride in having obliterated them".

Hence we can conclude that if the Middle Ages received spirit as its share, the Renaissance took a malicious pleasure in imprisoning us in the letter...

What Charles de Remusat says is very judicious, at least as far as the first medieval period is concerned, when the intelligentsia appeared submissive to the Byzantine influence and still imbued with Roman doctrines. A century later, the same reasoning loses a great part of its value; one cannot dispute, for example, that the works of the epic of the round Table have a certain charm which arises from a more careful form. Thibaut, Count of Champagne, in his *Songs of the kings of Navarre*, Guillaume de Lorris and Jehan Clopinel, authors of the *Romance of the Rose*, all our *trouvères* and *troubadours* of

the 13th and 14th centuries without having the proud genius of the learned philosophers, their ancestors, knew how to pleasantly handle words and often express themselves with a grace and flexibility which characterizes today's literature.

Therefore, we do not see why the Renaissance held a grudge against the Middle Ages and recorded its supposed literary shortcomings, so as to prohibit it and to throw it back into the chaos of new civilizations emerging from barbarism.

As for us, we deem medieval thought to be of scientific nature and of no other, for which art and literature are only the humble servants of traditional science. They are appointed to symbolically translate the truths of the Middle Ages received from Antiquity, whose faithful depository or remained. Subjected to a purely allegorical expression, held under the forceful will of the same parable which removes Christian mystery from the layman, art and literature display an obvious unease and reveal some stiffness; yet, the solidity and simplicity of execution endow them with an incontestable originality. It is true that the observer will never find alluring the image of Christ, such as it is presented on Romanesque porches, where Jesus appears, at the center of the mystical almond, surrounded by the four evangelical animals. It is enough for us that his divinity be emphasized by his own emblems and announces itself as revealer of a secret teaching. We admire the Gothic masterpieces for their nobility and the boldness of their expression; if they do not have the delicate perfection of form, they possess to a supreme degree the initiatory power of a learned and transcendent philosophy. They are severe and austere productions, not the light, graceful, and pleasing motifs, such as those art fondly wasted on us since the Renaissance. But while the latter aspire only to flatter the eye or to charm the senses, the artistic and literary works of the Middle Ages are founded on higher thought, true and concrete, the cornerstone of an immutable science, the indestructible basis of Religion. If we had to define these two tendencies, one profound, the other superficial, we would say that Gothic art is entirely contained in the learned majesty of its buildings and the Renaissance in the pleasant ornament of its dwellings.

The medieval colossus did not collapse all at once in the decline of the 15th century. Here and there, its genius succeeded in resisting for a long time the imposition of the new directives. We see its agony prolonged well into the middle of the next century, and we find in some of the buildings of that period the same philosophical impulse, the same foundations of wisdom which generated for three centuries so many imperishable works. And so, without taking account of their later erections, we will consider these works of later importance but of similar meaning with the hope of discovering in them the secret idea symbolically expressed by their builders.

Notwithstanding their purpose and their use, we rank these refuges of the esotericism of antiquity, these sanctuaries of traditional science, quite rare today, in the hermetic iconology among the artistic guardians of the great philosophical truths.

Would you like an example? Here is an admirable tympanum (2) which decorated in the faraway 12th century the front door of an old house from the region of Reims (Plate II). The quite clear topic could easily do without a description. Under a great arcade inscribing two other twin arcades within it, the master teaches his disciple and points this finger to the pages of an open book on the passage which he is commenting on. Underneath, a young and vigorous athlete strangles a monstrous animal, perhaps a dragon, of which we can only see the head and neck. He stands next to two young people closely embracing. Science thus appears as the ruler of Strength and Love, opposing the superiority of mind to the physical manifestations of power and feeling.

How could one conceive that a construction signed with such a thought did not belong to some unknown philosopher? Why would we refuse to this bas-relief the credit of a symbolic conception emanating from a cultivated brain, from a learned man affirming his love of study and teaching by this example? We would be most assuredly wrong to exclude the dwelling with such a characteristic frontispiece from the number of emblematic works which we propose to study under the general title of Dwellings of the Philosophers.

(1) Charles de Remusat: *Critiques et Etudes Littéraires* (Literary Critics and Studies). (2) This tympanum is kept at the Musée Lapidaire of Reims Sculpture Museum, located in the public hospital building (former abbey of Saint-Remi, on Simon Street). It was discovered around 1857 during the construction of the prison in the foundations of the house called the Christendom of Reims, located on the site of the Parvis, and with the inscription: *Fidas, Spes, Caritas*, (Faith, Hope and Charity). This house belonged to the chapter.

### III. MEDIEVAL ALCHEMY

Of all the sciences cultivated in the Middle Ages certainly none was more in fashion and received more honor than the science of alchemy. Such is the name under which the sacred or priestly Art was hidden among the Arabs, who had inherited it from the Egyptians and which the medieval West was to receive later on with so much enthusiasm.

Many controversies have been raised about the diverse etymologies attributed to the word alchemy. Pierre-Jean Fabre in his

Summary of Chemical Secrets claims it recalls the name of Cham, son of Noah, supposed to have been the first alchemical artisan, and he writes it alchamie. The anonymous author of a curious manuscript (1) thinks that "the word alchemy is derived from als which means salt in Greek and from chymie which means fusion, and it is thus well named, since salt which is so admirable has been usurped". But if salt is named [\*39-1 ] (als) in the Greek language, [\*39-2] (cheimeia) standing for [\*39-3] (chymeia), alchemy, has no other meaning than that of sap or secretion. Others find its origin in the first renomination of the land of Egypt, native land of the sacred Art, Kymie or Chemi. Napoleon Landais finds no difference between the two words chimie and alchimie (chemistry and alchemy); he simply adds that the prefix al should not be mixed up with the Arabic article al and simply means marvelous virtue. Those who hold the opposite hypothesis, using the article al and the noun chimie, understand it to mean chemistry par excellence or the hyperchemistry of modern occultists. If we had to bring in our personal opinion in this debate, we would say that phonetic cabala recognizes a close relationship between the Greek words [\*40-1 ] (Cheimeia), [\*40-2] (Chymeia), and [\*40-3] (Cheuma), which indicates that which runs down, streams, flows, and particularly indicates molten metal, the fusion itself, as well as any work made from molten metal. This would be a brief and succinct definition of alchemy as a metallurgical technique (2). But we know, on the other hand, that the name and the thing are based on the permutation of form by light, fire or spirit; such is in any case the true meaning indicated by the Language of the Birds.

Born in the Orient, land of the mysterious and the marvelous, the alchemical science spread in the West through three great roads of penetration: Byzantine, Mediterranean, and Hispanic. It was above all the result of Arabic conquests. This curious, studious people, avidly interested in philosophy and culture, a civilizing people par excellence, forms the connecting link, the chain which connects oriental antiquity to the occidental Middle Ages. It plays in the history of human progress a role comparable to that exercised by the Phoenician merchants between Egypt and Assyria. The Arabs, educators of the Greeks and Persians, transmitted to Europe the science of Egypt and Babylon, augmented by their own acquisitions, throughout the European continent (the Byzantine Road) around the 8th century of our era. Furthermore, the Arab influence exercised its action in our countries upon the return of the expeditions to Palestine (Mediterranean Road) and it is the Crusaders of the 12th century who imported most of the ancient knowledge. Finally, closer to us, at the dawn of the 13th century, new elements of civilization, science, and art, coming around the 8th century from Northern Africa spread into Spain (the Hispanic Road) and increased the first contributions of the Greek-Byzantine center of learning.

At first timid, hesitant, alchemy progressively woke up, and it was not long before it became stronger. It tended to take the lead, and thus the exotic science transplanted to our soil acclimatized itself wonderfully to it with such vigor that it soon bloomed into an exuberant flowering. Its development, its progress was prodigious. It was barely cultivated --exclusively in the shadows of monastic cells --in the 12th century; by the 14th, it had propagated everywhere, radiating upon all social classes, shining everywhere with the brightest glow. Every country gave to the mysterious science a nursery of fervent disciples, and each social condition devoted itself to it. Nobility and the upper middle class practiced it. Scholars, monks, princes, prelates professed it; even master craftsmen, minor artisans, goldsmiths, gentle glassmakers, enamellers, apothecaries, experienced the irresistible desire to handle the retort. And if no one worked it it openly --royal authority hunted down the puffers and the Popes fulminated against them (3) --no one failed to study it undercover. The company of philosophers, true ones or pretenders, was avidly sought after. These philosophers undertook long trips with the intention of augmenting their knowledge, or they wrote one another from country to country, kingdom to kingdom, using a cipher. People fought over the manuscripts of the great Adepts, those of the cosmopolitan Zosimus, Ostanes, Synesius, over copies of Geber, Rhazes, Artpehius. The books of Morien, Mary the prophet, the fragments of Hermes were traded at an exorbitant price. Intellectuals were seized by the fever, and thanks to the help of fraternities, lodges, initiation centers, the puffers grew and multiplied. Few families escaped the pernicious attraction of the golden chimera; very rare were those who did not count in their midst some practicing alchemist, some hunter of the impossible. Imagination was given free reign. The auri sacra fames (accursed hunger for gold) ruined the nobleman, caused despair in the common man, starved anyone who let himself be caught, and profited only the charlatans. Lenglet Dufresnoy (4) writes: "Abbots, bishops, doctors, recluses, all made it their occupation; it was the folly of the time, and everyone knows that every century has one which is its own; but unfortunately, this one lasted longer than the others and is not even completely over".

With what passion, what spirit, what hopes the cursed science envelops the Gothic cities sleeping under the stars! Subterranean and secret fermentation which, as soon as night has come, fills the deep cellars with strange pulsations, emitted from ventilation grills in intermittent bursts, and climbs in sulphurous volutes to the top of the gables!

After the famous name of Artepheus (around 1130), the renown of the masters who succeeded him consecrates the hermetic reality and stimulated the ardor of the candidates to Adepthood. In the 13th century, there is the illustrious English monk, Roger Bacon, whom his disciples nickname Doctor admirabilis (1214-1292) and whose enormous reputation becomes universal; next comes France, with Alain de l'Isle, doctor of Paris and monk of Citeaux (who died around 1298); Christopher the Parisian (around 1260); and Master Arnold of Villanova (1245-1310), while in Italy Thomas Aquinas ---

Doctor angelicus ---(1225) and the monk Ferrari (1280) shine.

The 14th century sees a whole new pleiad of artists emerge. Raymond Lully ---Doctor illuminatus ---a Spanish Franciscan monk (1235-1315); John Dastin, an English philosopher; John Cremer, Abbot of Westminster; Richard nicknamed Robert the Englishman, author of *Correctum alchymiae* (around 1330); the Italian Petrus Bonus of Lombardy; the French Pope John XXII (1244-1317); William of Paris, inventor of the hermetic bas-reliefs on the porch of Notre-Dame; Jehan de Mehun, called Clopinel, one of the authors of the *Romance of the Rose* (1280-1364); Grasseus, nicknamed Hortulanus, commentator on the Emerald Table (1358); finally, the most famous and the most popular philosopher of our country, the alchemist Nicholas Flamel (1330-1417).

The 15th century marks the glorious period of the science and surpasses even the preceding ones as much by the value as by the number of the masters who rendered it illustrious. Among them, Basil Valentine should be quoted first, a Benedictine monk from the abbey of St Peter's at Erfurt, in the electorate of Mainz (about 1413), perhaps the most significant artist the hermetic art has ever produced; one ought to also cite his compatriot, the abbot Trithemius; Isaac Hollandus (1408); the two Englishmen, Thomas Norton and George Ripley; Lampsprinck; George Aurach of Strasbourg (1415); the Calabrian monk Lacinius (1459); and the noble Bernard Trevisan (106-1490) who spent 56 years of his life pursuing the Great Work, and whose name will remain in the history of alchemy as a symbol of constancy, unshakable perseverance and obstinacy.

From that moment on, hermetism falls into discredit. Its very supporters, embittered by failure, turn against it. Attacked from all sides, its prestige disappears; enthusiasm decreases, opinion is modified. Practical operations, which had been collected, gathered after being unveiled and taught, allow dissidents to support the thesis of the alchemical void, to ruin philosophy while building the basis of our chemistry. Seton, Wenceslas Lavinius of Moravia, Zacharius, and Paracelsus are, in the 16th century, the only known heirs to the Egyptian esotericism, which the Renaissance rejected after corrupting it. Let us, in passing, pay a supreme tribute to the passionate defender of antique truths ---Paracelsus; the great tribune deserves from us eternal gratitude for his ultimate and courageous intervention. Although it was in vain, his intervention is nonetheless one of his highest titles to fame.

The hermetic art prolongs its agony until the 17th century and finally passes away, after having given to the occidental world three offsprings of great influence: Lascaris, President d'Espagnet, and the mysterious Eirenaeus Philalethes, a living enigma whose true identity has never been uncovered.

(1) *L'Interruption du Somneil cabalistique ou le Devoilement des Tableaux de l'Antiquite* (The Interruption of Cabalistic Sleep, or Unveiling of Paintings from Antiquity), 18th century manuscripts with drawing ---Bibliotheque de Arsenal # 2520 (175 S.A.F.), Bibl. Nat., old French funds, # 670 (7123), 17th Cty., Bibl. St Genevieve, #2267, treatise II, 18th cty. (2) And still this definition would be more appropriate for archimyy or voarchadumy, a branch of the science which teaches the transmutation of metals into one or another rather than alchemy proper. (3) Cf. Papal bull *Spondet pariter*, issued against alchemists by Pope John XXII in 1317, who nonetheless had written a very singular *Ars Transmutatoria Metallorum*. (4) Lenglet-Dufresnoy, *Histoire de la Philosophie Hermetique* (History of Hermetic Philosophy), Paris Coustelier, 1742.

#### **IV. THE LEGENDARY LABORATORY**

With its following of mystery and the unknown, behind its veil of illuminism and marvel, alchemy evokes a past full of distant stories, wonderful tales, and surprising testimonies. Its singular theories, its strange recipes, the time-honored reputation of its great masters, the passionate arguments it aroused, the favor it enjoyed in the Middle Ages, its obscure, enigmatic and paradoxical literature, seem to give off today the smell of mustiness, of rarified air acquired over long years by empty tombs, dead flowers, abandoned dwellings, yellowed parchments.

The Alchemist? ---A meditative elderly man, with a grave forehead, crowned with white hair, a pale and wasted silhouette, an original character from a long gone humanity and a forgotten world, an obstinate recluse, stooped by years of study, late nights, persevering research and unscrambling of the enigmas of the high science. Such is the philosopher that the poet's imagination or the painter's brush like to depict for us.

His laboratory ---cave, cell, or ancient crypt ---is dimly lit by gloomy daylight diffused through the myriad dusty spider webs. Yet, it is there, amidst the silence, that the prodigy is slowly accomplished. Untiring nature works ---better than in the rocky abysses ---under the prudent attention of man, with the help of the stars and the grace of God. Occult labor, Cyclopean and thankless task, as vast as a nightmare! At the center of this in pace ---in peace, a being, a scholar for whom nothing else exists any more, watches, attentive and patient, over the successive stages of the Great Work...

As our eyes become accustomed to the darkness, thousands of things emerge from the shadow, are revealed, and take on a precise shape. Good Lord, where are we? Could it be Polyphemus' den or Vulcan's cave?

Near us, an extinguished forge, covered with dust and metal scales; the anvil, hammer, tongs, shears, clamp irons; rusted ingot molds; the rough and powerful tools of the metallurgist ended up there. In a corner, thick books heavily bound with iron ---such as antiphonals ---with signets sealed with antiquated leads; ashy manuscripts, mysterious books piled up; yellowed volumes filled with notes and formulas, stained from the incipit to the text. Flasks, bulging like good monks, filled with opalescent emulsions, pale green, blue-green, or flesh- colored liquids, exhale these stale acid odors whose sharpness contradicts the throat and stings the nose.

On the hood of the furnace strange oblong vessels are aligned, with short pipes, caulked and covered with wax; mattresses, with spheres, rainbowed by metallic deposits, extend their necks, sometimes cylindrical and slender, sometimes widened or inflated; greenish homed vessels, retorts, and pottery dishes sit next to crucibles made of red and flame-like earth. In the far corner, placed on their straw baskets all along a stone cornice, philosophical eggs, in transparent and elegant contrast to the massive and rounded cucurbit ---praegnans cucurbita.

Damnation! Here are now some anatomical specimens, skeletal fragments: blackened, toothless skulls, repugnant with their beyond-the-grave grin; suspended human fetuses, desiccated and shriveled, miserable remnants showing their minute bodies, their parchment heads, sneering and pitiful. These round, vitreous and golden eyes are those of an owl with dull feathers, which stands next to the alligator, giant salamander, another important symbol of the practice. The fearsome reptile emerges from an obscure recess, stretches the chain of his vertebrae on his stout legs and directs the bony abyss of his frightful jaws towards the arched ceiling.

Placed randomly, in case of need, on the bed-plate of the furnace, notice these vitrified pots, aludels, and sublimatories; these pelicans with thick walls; these infemal vessels similar to large eggs whose chalazas are visible, these olive-colored bottles buried in the middle of the sand against the athanor, with its light fumes climbing over the ribbed vault. Here is the copper alembic ---homo galeatus (1) ---stained with green smudges; there the descensories, the cucurbits and their antenos, the two brothers or twins of the cohobation; coiled receivers; heavy cast-iron and marble mortars; a large bellows with its wrinkled leather sides, near a pile of muffles, tiles, cupels, and evaporators...

A chaotic conglomeration of archaic instruments, bizarre materials and out-of-date utensils; a confusion of all sciences, a tangle of impressive faunas! And, looking down upon this disorder, affixed to the keystone of the vault, a pendant with spread wings, the great raven, hieroglyph of material death and its decompositions, the mysterious emblem of the mysterious operations.

Curious a well is the wall, or at least what is left of it. Some inscriptions of mystical meaning fill the voids: *Hic lapis est subtus te, supra te, erga te et circa te* (2), mnemonic verses entangle themselves, whimsically engraved with a stiletto on soft stone; one of them dominates, carved in Gothic cursive writing: *Azoth et ignis tibi sufficient*(3), Hebrew characters; circles intersected with triangles, interspersed with quadrilateral figures in the manner of Gnostic signatures. Here, a thought based on the dogma of unity summarizes all of philosophy: *Omnia ab uno et in unum omnia* (4). Elsewhere, the image of the scythe, emblem of the 13th Arcanum and the house of Saturn; the Star of Solomon; the symbol of Cancer, supplication of the evil spirit; a few passages from Zoroaster, witness to the great antiquity of the accursed sciences. Finally, bathing in the light field of the basement window and more legible in this labyrinth of imprecisions, the hermetic ternary: Salt, Sulphur, Mercury...

Such is the legendary painting of the alchemist and his laboratory. Fantastic vision, lacking truth, sprung from popular imagination and reproduced in the old almanacs, treasures of the peddler's trade.

Puffers, magicians, sorcerers, astrologers, necromancers?

Anathema and malediction!

(1) Translator's Note: Helmeted man. (2) Translator's Note: This stone is directly beneath you, above you, in you, all around you. (3) Translator's Note: Nitrogen and fire will suffice. (4) Translator's Note: All from one and in one all.

## **V. CHEMISTRY AND PHILOSOPHY**

Chemistry, incontestably, is the science of facts, just as alchemy is that of causes. The first, confined to the material domain, is supported by experiment. The second preferably takes its directives from philosophy. While the object of the first is the study of natural bodies, the other tries to penetrate the mysterious dynamics which preside over their transformations. Therein lies their essential difference, enabling us to say that alchemy, compared with our positive science, the only one permitted and taught today, is a spiritualistic chemistry, for it allows us to catch a glimpse of God through the darkness of

substance.

Furthermore, in our opinion, it seems insufficient to know how to recognize and classify facts exactly; one must still question nature, and learn from her in what conditions and under the control of what will her manifold productions can take place. Indeed, the philosophical mind will not be content with the mere possibility of identifying bodies. It demands the knowledge of the secret of their elaborations. To open ajar the door of the laboratory where nature mixes the elements, is good; to discover the occult force under whose influence her work is accomplished, is better. We are obviously far from knowing all natural bodies and their combinations, since we discover new ones daily; but we know enough to temporarily leave aside the study of inert matter and direct our researches towards the unknown animator, agent of so many marvels.

To say, for example, that two volumes of hydrogen combined with one volume of oxygen yield water, states a chemical banality. And yet, who will teach us why the result of this combination presents, in a special state, characteristics which the gases that produced it do not possess? What then is the agent which imposes its new specificity upon the compound and forces the water, solidified by cold, always to crystallize in the same system? Furthermore, if the fact is undeniable and rigorously controlled, why is it that it is impossible for us to reproduce it simply by reading the formula charged with explaining its mechanism? For, in the notation  $H_2O$ , the essential agent, capable of provoking the intimate union of the gaseous elements is missing --i.e., fire. Yet, we challenge the most skilled chemist to manufacture synthetic water by mixing oxygen and hydrogen in the indicated volumes: the two gases will always refuse to combine with one another. To succeed in the experiment, it is essential to introduce fire, either in the form of a spark, or in the form of an ignited body or still a body liable to be brought to the point of incandescence (platinum sponge). So one recognizes, without being able to oppose the least serious argument to our thesis, that the chemical formula of water is, if not false, at least incomplete and truncated. And the elemental agent fire, without which no combination can be effected, being excluded from the chemical notation, the entire science proves to be filled with gaps and incapable of providing through its formulas a logical and true explanation of the studied phenomena. "Physical chemistry", writes A. Etard (1), "lures the majority of research minds. It is the one which touches most closely on profound truths and which will slowly give us laws capable of changing all of our systems and our formulas. However, by its very importance, this kind of chemistry is the most abstract and the most mysterious that exists. During the short moments of a creative thought, the best minds cannot succeed in applying and comparing all the great well-known facts. Faced with this impossibility, they resort to mathematical representations. These representations are most often perfect in their methods and results; but in their application to what is deeply unknown, we cannot make mathematics reveal truths whose elements we have not given them, The most gifted man presents the problem badly which he does not understand. If these problems could be correctly formulated in an equation, we could have the hope of resolving them. But, in our present state of ignorance, we are fatally compelled to introduce numerous constants, to neglect certain terms, and to apply hypotheses. Putting the problem into an equation is perhaps no longer altogether correct. Even so, we console ourselves because it leads to a solution; but, it is a temporary arrest of the progress of science when such solutions are imposed for years on good minds as a scientific demonstration. A lot of work is done in this direction which takes time and which leads to contradictory theories, destined to be forgotten".

These famous theories, which were long evoked and opposed to hermetic conceptions, see their solidity strongly compromised today. Sincere scientists, belonging to the creative schools of the same hypotheses ---considered to be certainties ---only grant them a very relative value; their field of action diminishes concurrently with the decrease of their power of investigation. Monsieur Emile Picard in the *Revue des Deux Mondes* expresses this state of affairs with a frankness revealing of the true scientific spirit. "As for theories", he writes, "they do not even propose to provide a casual explanation for the reality itself, but only to translate it into images or mathematical symbols. We ask of theories, which are tools of the trade, to coordinate, at least for a while, known phenomena and to predict new ones. When their fecundity is exhausted, we try to make them undergo transformations which the discovery of new facts have rendered necessary". And so, contrary to philosophy which precedes facts, ensures the direction of ideas, and their practical connection; theories, conceived after the fact and modified according to the results of experiments as new acquisitions are made, always reflect the uncertainty of provisional things, and give modern science a character to perpetual empiricism. Numerous chemical facts, seriously observed, resist logic and defy all reason. "For example", J. Duclaux (2) says, "bivalent copper iodide spontaneously decomposes into iodine and monovalent copper iodide. Since iodine is an oxidizer and copper salts are reducing agents, this decomposition cannot be explained. The formation of extremely unstable compounds, such as nitrogen trichloride, is equally inexplicable. We can no more understand why gold, which is resistant to acids and alkalies, even when concentrated and hot, dissolves in a cold dilute solution of potassium cyanide; why hydrogen sulfide is more volatile than water; why sulphur chloride, composed of two elements each of which combine with potassium forming incandescence, is itself without action on this metal".

We have just spoken of fire; and yet, we only envisage it in its common form and not in its spiritual essence, which introduces itself in bodies at the very moment of their appearance on the physical plane. What we want to demonstrate

without leaving the alchemical domain, is the grave error which dominates all of modern science and which prevents it from recognizing this universal principle which animates substance, to whatever kingdom it belongs. Yet it manifests itself all around us, under our very eyes, either by the new properties which matter inherits from it or by the phenomena which accompany its liberation. Light ---rarified and spiritualized fire ---possesses the same chemical virtues and power as elementary crude fire. An experiment, with the object of synthetically creating hydrochloric acid (HCl) from its components, amply demonstrates it. If we put equal volumes of chlorine and hydrogen gas in a glass flask, the two gases will keep their own individuality as long as the flask that contains them is kept in darkness. With some diffused light, they progressively combine. But if we expose the vessel to direct solar rays, it explodes and shatters violently.

The objection will be raised that fire, considered a mere catalyst, is not an integral part of the substance and therefore cannot be indicated in the expression of chemical formulas. The argument is more fallacious than true, since the experiment itself belies it. Here is a piece of sugar in whose equation there is no equivalent for fire; if we break it in darkness, we will see a blue spark shoot out from it. Where does it come from? Where would it be contained if not in the crystalline structure of the saccharose? We mentioned water; let us throw on its surface a fragment of potassium: it spontaneously bursts into flame and burns energetically. Where is this visible flame hiding? It matters little whether it be in water, air, or metal; the essential point is that it potentially exists inside one or the other of these bodies, perhaps in the three. What is phosphorus, the light-bearer and generator of fire? How do noctilucas, glowworms and fireflies transform part of their vital energy into light? What compels the salts of uranium, cerium, and zirconium to become fluorescent when they have been submitted to the action of sunlight? By what mysterious synchronism does barium platinum cyanide shine when in contact with Roentgen rays?

Let no one come and talk to us about oxidation being in the normal order of igneous phenomena. It would be deferring the question rather than resolving it. Oxidation is a result, not a cause. It is a combination, subject to an active principle, to an agent. If some energetic oxidations disengage heat or fire, it is most certainly because this fire was already engaged in it. The electrical fluid, silent, obscure, and cold runs through its metallic conductor without otherwise influencing it nor revealing its passage. But if it meets with resistance, the energy immediately reveals itself with the qualities and in the form of fire. A lamp filament becomes incandescent, the charcoal of a retort ignites, the most refractory metallic wire melts at once. So, isn't electricity indeed fire or a potential fire? Where does it draw its origin if not from decomposition (batteries), or from the disintegration of metals (dynamos), bodies highly charged with the igneous principle? Let us detach a particle of steel or of iron by grinding it on a stone or by striking it against a flint and we will see a spark shining, thus freed. We know the pneumatic lighter well enough, based on the property possessed by atmospheric air being ignited by simple compression. Liquids themselves are often genuine reservoirs of fire. It suffices to pour a few drops of concentrated nitric acid on oil of turpentine to provoke its inflammation. In the category of salts let us mention in passing fulminate, nitrocellulose, potassium picrate, etc.

Without further multiplying examples, we see that it would be childish to maintain that fire, because we do not directly perceive it in matter, does not really exist there in a latent state. Ancient alchemists, who had, according to traditional sources, more knowledge than we are willing to grant them, assured us that the sun is a cold star and that its rays are dark (3). Nothing would seem more paradoxical nor more contrary to appearances, and yet nothing is truer. A few moments of reflection allow us to become convinced. If the sun were a globe of fire, as we are taught, it would be enough to approach it, even a little, to experience the effect of a growing heat. Precisely the opposite occurs. High mountains remain crowded with snow despite the heat of summer. In the elevated regions of the atmosphere when the sun reaches its zenith, the cupolas of hot-air balloons are covered with frost and the passengers suffer from intense cold. So, experience demonstrates that temperature goes down as altitude increases. Even light is only visible to us in as much as we are placed in its field of radiation. If we are outside the radiant beam, its action ceases for our eyes. It is a well-known fact that an observer looking at the sky from the bottom of a well at noon sees the starry night sky.

Whence, then, do heat and light come? From the simple shock of cold and dark vibrations against the gaseous molecules of our atmosphere. And since resistance increases in direct proportion to the density of the environment, heat and light are stronger on the surface of the earth than at great altitudes because the strata of air are also denser. Such is, at least, the physical explanation of the phenomenon. In fact, and according to hermetic theory, the opposition of the vibratory movement, the reactions are nothing more than the first causes of an effect which translates into the liberation of luminous and fiery atoms from atmospheric air. Under the action of the vibratory bombardment, the spirit, freed from the body, takes on, for our senses, physical qualities characteristic of its active phase: luminosity, brilliance, heat.

Thus, the only approach that we can address to chemical science is that it does not take into account the igneous agent, spiritual principle and basis of energetics, under whose influence all material transformations occur. It is the systematic exclusion of this spirit, higher will, and hidden dynamism of things, which deprives modern chemistry of the philosophical

character alchemy possesses. "You believe", writes Monsieur Henri Helier to Monsieur L. Olivier (4) , "in the indefinite fruitfulness of experience. Indeed, but experimentation has always been led by a preconceived idea, by a philosophy. An idea often almost absurd in appearance, a philosophy sometimes bizarre and disconcerting in its signs. 'If I told you how I make my discoveries', Faraday used to say, 'you would take me for an imbecile'. All the great chemists thus had ideas in the back of their heads which they never revealed... It is from their work that we have extracted our methods and our present theories; they are the most precious result, but they were not the origin".

"The alembic, with its serious and sedate airs", says an anonymous (5) philosopher, "has gathered an enormous clientele in chemistry. Just try to trust it; it is an unfaithful depository, a usurer. You entrust it with a perfectly healthy object, endowed with incontestable natural properties, having a form which constitutes its existence. It returns to you shapeless, in powder form or in gaseous form. It pretends to give you everything back when it has kept everything, minus the weight, which is nothing since it comes from a cause independent of the body itself. And the union of scientists sanctions this horrible usury! You give it wine, it gives you back tannin, alcohol and water in equal weights. What is missing there? The taste, that is the only thing which makes wine what it is, and so on with everything else. Because you have extracted three things from wine, gentlemen chemists, you say: wine is made of three things. Turn them back into wine or else I will say to you: these are three things which are made from the wine. You can undo what you have done, but you will never remake that which you have undone in nature. Bodies only resist you in proportion to how strongly they are compounded, and you call simple bodies all those that resist you: vanity!

"I like the microscope; it simply shows us things as they are, merely extending our perception, therefore it is the scientists who attribute opinions to it. But when, deeply immersed in the smallest details, these gentlemen come to bring to the microscope the smallest grain or the smallest droplet, the sarcastic instrument seems to say to them by showing them live animals there: Analyze those for me. So, what is the analysis? Vanity, vanity!

"Finally, when a learned doctor cuts into a cadaver with his scalpel to find the causes of the illness that killed the victim, using a microscope he can only find the results. For the cause of death is in that of life, and true medicine, that which Christ naturally practiced, and which is being scientifically reborn with homeopathy, the medicine of similarities, can only be studied on life. And, as far as life is concerned, since there is nothing which resembles a living being less than a dead one, anatomy is the most pitiful of vanities.

"So are all instruments a cause of error? Far from it; but they indicate truth within limits that are so restricted that their truth is nothing but a vanity. Therefore, it is impossible to attach absolute truth to it. This is what I call the impossible of the real and which I make note of in order to affirm the possible of the marvelous".

Positive in its facts, chemistry remains negative in its spirit. And this precisely differentiates it from the hermetic science, whose proper domain consists above all in the study of efficient causes, of their influences, and of the modalities which they take on according to the settings and conditions. This study, exclusively philosophical, allows man to penetrate the mystery of facts, to grasp its vastness, and to finally identify it with the Supreme Intelligence, soul of the Universe, Light, God. And so, alchemy, making its way from the concrete to the abstract, from material positivism to pure spiritualism, broadens the field of human consciousness, of possibilities of action, and realizes the union of God with Nature, of Creation with the Creator, of Science with Religion.

Let no one see in this argument any unfair or tendentious criticism directed against chemists. We respect all workers of whatever profession they may belong, and we personally profess the deepest admiration for the great scientists whose discoveries have so magnificently enriched modern science. But the thing which, along with us, men of good faith will regret is not so much differences of opinion freely expressed as the unfortunate intentions of a narrow sectarianism, injecting discord between the partisans of one doctrine and another. Life is too short, too precious to waste in vain polemics, and it does not honor oneself to despise the knowledge of others. Furthermore, it matters little that so many seekers go astray, if they are sincere and if their error itself leads them to useful acquisitions; *errare humanum est*, to err is human, says the old proverb and illusion often adorns itself with the diadem of truth. Those who persevere in spite of failure have a right to our regard. Unfortunately, scientific spirit is a rare quality in men of science, and we can trace this lack back to the origin of the strife we mentioned. From the fact that a truth is neither demonstrated nor demonstrable using the means at the disposal of science, we cannot infer that it will never be so. "The word impossible is not French", said Arago; we add that it is contrary to the true scientific spirit. To call a thing impossible because its present possibility remains doubtful, is to lack confidence in the future and to deny progress. Doesn't Lemery (6) commit a serious indiscretion when he dares to write about the alkahest or universal solvent: "As for me, I believe it to be imaginary, because I do not know of any". It will be agreed that our chemist overestimated the value and extent of his knowledge. Harrys, a mind refractory to hermetic thought, thus defined alchemy without ever having desired to study it: *Ars sine arte, cujus principium est menuri, medium laborare et*

finis mendicare(7) .

Next to these scientists locked up in their ivory tower, next to these men of incontestable merit it is true, yet others, the slaves of tenacious prejudices, did not hesitate to grant civil rights to the old science. Spinoza and Leibnitz believed in the Philosophers' Stone, the chrysopea; Pascal became certain of it (8). Nearer to us, a few celebrated minds, among others Sir Humphrey Davy, thought that hermetic research could lead to unexpected results. Jean- Baptiste Dumas, in his Lessons on Chemical Philosophy, expresses himself in these terms: "Would it be possible to admit the existence of simple isomeric bodies? This question comes very close to the transmutation of metals. Resolved affirmatively, it would give chances of success to the search for the Philosophers' Stone... We must therefore consult experimentation, and experimentation, it must be said, is until now not in opposition the possibility of the transmutation of simple bodies... It is even opposed to rejecting this idea as an absurdity which could be demonstrated by the present state of our knowledge". Francois- Vincent Raspail was a convinced alchemist and the works of the classical alchemist and the works of the classical philosophers occupied a prominent place among his other books. Ernest Bosc (9) tells us that Auguste Cahours, member of the Academy of Sciences, had told him that his venerated master, Chevreul, professed the greatest esteem for our old alchemists, and his rich library contained almost all the important works of the hermetic philosophers (10). It even appears that the dean of the students of France, as Chevreul called himself, had learned a great deal from these old books, and he owed them part of his beautiful discoveries. The illustrious Chevreul knew how to read between the lines much of the information that had not been noticed before him. One of the most famous of the masters of the chemical science, Marcellin Berthelot, was not content to adopt the opinion of the college. Contrary to a number of his colleagues who spoke boldly of alchemy without knowing it, he devoted more than 20 years to a patient study of original Greek and Arabic texts. And from this long contact with the ancient masters, the conviction was born in him that "hermetic principles as a whole are as tenable as the best modern theories". If we are not held by the promise that we had made to them, we could add to these scientists the names of certain scientific leaders, entirely given to the Art of Hermes, but whose very situation forces them to practice it only in secret.

Today, although the unity of substance ---basis of the doctrine taught since antiquity by all alchemists ---is received and officially sanctioned, it does not seem that the idea of transmutation has followed the same progression. This fact is all the more surprising because we could not agree with the one without conceiving the possibility of the other. Furthermore, given the great antiquity of the hermetic thesis, we would have some reason to think that in the course of centuries it could possible have been confirmed by experimentation. It is true that scientists usually do not pay much attention to this kind of argument; testimonies most worthy of faith and best supported seem suspect to them, either they ignore them or they prefer not to be interested in them. So as not to be accused of showing ill will by distorting their thought, and so as to allow the reader to exercise his judgment in all freedom, we submit to his appreciation the opinions of modern scientists and philosophers on the subject that concerns us. Jean Finot (11), having called upon competent men, asked them the following question: In the present state of science is metallic transmutation possible or realizable? Can it even be considered as realized in the condition of our knowledge? Here are the answers that he received:

Dr Max Nordeau ---"Allow me to abstain from all discussions about the transmutation of matter. I adopt the dogma (it is one) of the unity of matter, the hypothesis of the evolution of chemical elements from the lightest to the heaviest atomic weight, and even the theory --imprudently called law of periodicity ---of Mendeleev. I do not deny the theoretical possibility of artificially recreating, through laboratory means, a part of this evolution naturally produced in billions or trillions of years by cosmic forces and to transform lighter metals into gold. But I do not believe our century will witness the realization of the dream of the alchemists".

Henri Poincare ---"Science cannot, and must not say never! It is possible that one day we will discover the principle of fabricating gold. But for now, the problem does not seem to be resolved". Madame Marie Curie ---"Though it is true that spontaneous atomic transformations have been observed in radioactive bodies, (the production of helium by these bodies you mention and which is perfectly correct), we can, on the other hand, affirm that no transformation of a simple body has yet been obtained by the effort of man or due to the devices imagined by him. It is therefore at present totally useless to consider the possible consequences of the fabrication of gold".

Gustave Le Bon ---"It is possible to transform steel into gold, as we transform, it is said, uranium into radium and helium --- but these transformations will most likely be on the scale of billionths of a milligram, and it would be then much more economical to extract gold from the sea which contains tons of it".

Ten years later, a popular scientific journal (12), devoted to the same inquiry, published the following opinions:

Charles Richet, professor at the Faculty of Medicine, member of the Institute, holder of the Nobel Prize ---"I admit that I have no opinion on this question".

Urabin and Jules Perrin ---"Unless there were a revolution in the art of exploiting natural forces, synthetic gold ---if it is not just a fantasy ---will not be worth being industrially exploited".

Charles Moureu ---"The fabrication of gold is not an absurd hypothesis! It is about the only affirmation that a true scientist can make... A scientist declares nothing a priori... Transmutation is a fact that we notice every day".

To this thought so courageously expressed, thought of a bold mind, gifted with the most noble scientific spirit and with a profound sense of truth, we will oppose another one very different in quality. It is the estimation of Henry Le Chatelier, member of the Institute, professor of chemistry at the Faculty of Sciences, "I absolutely refuse any interview on the topic of synthetic gold. I consider that it must come from some attempt of fraud, like the famous diamonds of Lemoine".

In truth, it would be difficult to use fewer words and less amenities to show how much contempt for the old Adepts, venerated masters of present alchemists. For our author, who has probably never opened a hermetic book, transmutation is synonymous with charlatanism. As the disciple of these great vanished men, it seems rather natural that we should inherit their unfortunate reputation. Who cares; there is our glory, the only one, by the way, which academic ignorance, proud of its gadgets: crosses, seals, palms, and parchments, condescends to grant us when it finds the opportunity. But let us allow the donkey to gravely carry its relics and let us resume our topic.

The responses that we have just read, except for that of Charles Moureu, are similar in content. They spring from the same source. Academic spirit has dictated them. Our scientists accept the theoretical possibility of transmutation; they refuse to believe in its material reality. They deny after having affirmed it. It is a convenient way to wait and see, to not compromise oneself nor to leave the domain of the relative.

Can we take atomic transformations into account when they concern a few molecules of a substance? How can we acknowledge them an absolute value when we can only control them indirectly through indirect means? Is that a mere concession the moderns are making to the ancients? We have never heard the hermetic science had asked for alms. We know it to be wealthy enough in observations and positive facts not to be reduced to begging. Besides, the theoretical idea that our chemists are defending today belongs without dispute to the alchemists. It is their property, and no one could refuse them the privilege of an admitted priority of fifteen centuries. They are the men who first demonstrated its effective realization, issuing from the unity of substance, the invulnerable basis of their philosophy. Furthermore, we ask why modern science, gifted with multiple and powerful means, rigorous methods served by precise and perfected tools, took so long to recognize the veracity of the hermetic principle? Then are we entitled to conclude that the ancient alchemists, using very simple processes, had nevertheless experimentally discovered the formal proof capable of imposing the concept of metallic transmutation as an absolute truth. Our predecessors were neither insane nor impostors, and the mother idea which guided their works, the very one which infiltrates scientific spheres of our times, is foreign to the hypothetical principles, whose fluctuation and vicissitudes of which our rimes have no idea.

We assert therefore, without taking sides, that the great scientists whose opinions we have quoted are mistaken when they negate the lucrative result of transmutation. They are mistaken about the constitution and the profound qualities of matter, though they believe they have fathomed all its mysteries. Alas, the complexity of their theories, amount of words created to explain the inexplicable, and above all, the pernicious influence of materialistic education, pushes them to search far away for that which is within their reach. Mathematicians for the most part, lose in simplicity and common sense that which they gain in human logic and numerical rigor. They dream of imprisoning nature into a formula, of putting life into an equation. So, by successive deviations they unconsciously succeed in getting so far from simple truth that they justify the harsh words of the Gospel: "They have eyes not to see and minds not to understand!".

Would it be possible to bring these men back to a less complicated conception of things, to guide these lost ones towards the light of spirituality which they are lacking? We shall attempt it, and shall first say, addressing those who are willing to follow us, that living nature is not to be studied outside of its activity. The analysis of the molecule and the atom teaches nothing: It is incapable of resolving the most elevated problem that a scientist is capable of presenting: What is the essence of this invisible and mysterious dynamism which animates substance? For what do we know of life, except that we find its physical consequence in the phenomenon of movement. Everything is life and movement on this earth. Vital activity, very apparent in animals and vegetables, is no less apparent in the mineral kingdom, although it requires sharper attention by the observer. Metals are indeed living and sensitive bodies. Proofs are: the mercury thermometer, silver salts, fluorides, etc. What is dilation and contraction if not two effects of metallic dynamism, two manifestations of mineral life? Yet, it is not enough for the philosopher to only notice the elongation of an iron bar submitted to heat, he must know that metal under the influence of caloric radiations opens its pores, distends its molecules, and increases its surface and volume. It 'blooms' in a manner of speaking, as we ourselves do under the action of the benevolent solar effluvia. It cannot therefore be denied

that such a reaction has a profound non material cause, for we would not know how to explain without this impulse what other force would oblige crystalline particles to leave their apparent inertia. This metallic will, the very soul of metal, is clearly made evident in one of the beautiful experiments by Ch.-Ed. Guillaume. A calibrated steel bar is submitted to a continuous and progressive traction whose power is measured with the aid of a dynamograph. When the bar is about to give, it shows a constriction, and the exact spot is marked. The extension ceases, and the bar is restored to its original dimensions, then the experiment is begun again. This time the constriction occurs in a point different from the first. By following the same technique, we will notice that all points on the bar have been successively treated, giving in one after the other to the same traction. And, if we calibrate the steel bar one last time, starting the experiment again from the very beginning, we verify that we need to use a much greater force than the one used first in order to provoke the return of the rupture symptoms. Ch.-Ed. Guillaume concludes from these experiments, with much reason, that the metal behaved as an organic body would have done. It has successively reinforced all its weak parts and purposefully increased its coherence to better defend its integrity. An analogous teaching can be derived from the study of saline crystallized compounds. If the angle of intersection of any crystal is broken and if its is plunged thus mutilated back into the mother liquor which produced it, not only does it immediately repair its wound, but it also grows with a greater speed than that of intact crystals which had remained in the same solution. We discover yet another evident proof of metallic vitality in the fact that in the United States, the tracks of railroads show without any apparent reason the effects of an unusual evolution. Nowhere are the derailings more frequent or the catastrophes more inexplicable. Engineers charged with the study of the cause of these multiple ruptures attribute them to "premature aging" of the steel. Under the probable influence of special climatic conditions, the metal ages quickly, early; it loses its elasticity, malleability, resistance; its tenacity and cohesion seem lessened, to the extent that it becomes dry and brittle. Moreover, this metallic degeneration is not uniquely limited to rails. It also extends its ravages to the armor plates of battleships which are generally taken out of service after a few months of usage. Upon testing, we are surprised to see them break into several pieces under the shock of a mere drop ball. The weakening of the vital energy, normal and characteristic phase of decrepitude, of the senility of the metal, is the precursor sign of its coming death. Since death, corollary of life, is the direct consequence of birth, it follows that metals and minerals manifest their subjection to the law of predestination which rules all created beings. To be born, to live, to die, or to transform oneself are the three stages of a unique period embracing all physical activity. And since this essential function of this activity is to renew, to continue oneself, and to produce oneself through regeneration we are brought to believe that metals as well as animals and vegetables, bear in themselves the faculty of multiplying their species.

Such is the analogical truth that alchemy has tried to practice. And, such is also the hermetic idea, which it has seemed necessary to us to emphasize first of all. So, philosophy teaches and experimentation demonstrates that metals, thanks to their own "seed", can be reproduced and developed in quantity. Anyway, this is what the word of God reveals in Genesis, when the Creator transmits a particle of His activity to creatures issued from His very substance. For the divine logos, grow and multiply does not apply uniquely and only to man. It is meant for the entirety of living beings spread throughout nature.

(5) *Comment l'Esprit vient aux tables (How the Spirit Comes to Tables)*, by a man who has not lost his mind/spirit; Paris, Libr. Nouvelle, 1854, p. 150. (6) Lemery; *Cours de Chymie (Chemistry Course)*, Paris, d'Houry, 1757. (7) "An artless art, of which the beginning is to lie, the middle is to labor, and the end is to beg". (8) Was Pascal an alchemist? Nothing allows us to claim that he was. What is more certain is that he must have realized the transmutation himself, unless he saw it accomplished before his eyes in the laboratory of an Adept. The operation lasted two hours. This is what comes out of a curious document, on paper, handwritten by him in mystical style and which was found sewn in his garment at the time of his burial. Here is the beginning of it, which is the essential part: "The Year of Grace, 1654; Monday, the 23<sup>rd</sup> of November, day of St Clement, pope and martyr and of others in the martyrology, Vigil of St Chrysogonus, martyr, and others, from around ten-thirty in the evening until approximately twelve-thirty after midnight, Fire. God of Abraham, God of Isaac, God of Jacob, not of Philosophers and of Savants. Certainty, Certainty, Feeling, Joy, peace".

We have purposefully underlined, although it was not so in the original text, the word Chrysogonus which the author uses to refer to the transmutation; it is formed of two Greek words: [\*57-1] (Chrysos), gold, and [\*57-2](gone), generation. Death, which usually takes away men's secret, had to deliver up that of Pascal, philosophus per ignem (Philosopher by fire).

(12) "Je sais tout". *Le fabrication synthétique de l'or est-elle*

Alchemy is obscure only because it is hidden. The philosophers who wanted to transmit the exposition of their doctrine and the fruit of their labors to posterity took great care not to divulge the art by presenting it under a common form such that the layman could not misuse it. Thus, because of the difficulty one has of understanding it, because of the mystery of its enigmas and of the opacity of its parables, the science has come to be shut up among reveries, illusions, and chimeras.

In fact these sepia-toned old books are not easily penetrated. To try to read them the way we read ours would be a mistake. Nevertheless, the first impression we receive from them, as strange and confusing as it may seem, remains vibrant and persuasive. Beyond the allegorical language and the abundance of ambiguous nomenclature, we fathom in them this ray of truth, this profound conviction born from certain facts, duly observed, and which owe nothing to the whimsical speculations of pure imagination.

You may probably object that the best hermetic works contain many gaps, accumulate contradictions, are embellished with false recipes; you may say that the *modus operandi* varies from one author to the next and that, if the theoretical development is the same with all, descriptions of the bodies used, on the other hand, rarely show a rigorous similarity among themselves. We shall answer that the philosophers had no other means at their disposal to steal from the ones what they wanted to expose to the others, but this confusion of metaphors, of diverse symbols, this prolixity of terms, of capricious formulas traced by the flow of a pen, expressed in clear language for the use of the greedy or the foolish. As for the argument about practice, it falls by itself for the simple reason that since the initial matter can be considered under any one of the multiple appearances which it takes during the course of the work, and since the artists never describe more than one part of the technique, as many distinct processes appear to exist as there are writers of the genre.

After all we should not forget that the treatises which have reached us were composed during the most beautiful alchemical period, the one which embraces the last three centuries of the Middle Ages. And at that time, folk mentality, totally impregnated with oriental mysticism, was fond of riddles, symbolic veils, allegorical expressions. This disguise flattered the rebellious instinct of the masses and provided the nobles with a new source for satiric verve. In this manner, it conquered general favor and was encountered everywhere, firmly established at the different levels of the social ladder. It shined in clever words during conversations among cultivated people, aristocrats and bourgeois, and it was vulgarized among vagrants in naive puns. It adorned shopkeepers' signboards with picturesque riddles and took hold of heraldry whose exoteric rules and protocol it established; it forced its multicolored costume of images, enigmas, and emblems on art, literature, and especially on esotericism.

To it we owe the variety of curious street signs whose number and singularity still add to the clearly original character of French medieval productions. Nothing shocks our modern sense more than these tavern placards oscillating on a wrought iron axis. We recognize, on one of them, the letter O capitalized followed by a K which has been struck out (1); but the drunkard of the 14th century was not deceived and entered the great tavern without hesitation. Hostelrys often put up a golden lion fixed in heraldic pose, which for the traveler seeking out accommodation meant that "one could sleep there", because of the double meaning and pun of the image (2). Edouard Fournier (3) explains that "la rue du Bout-du-Monde" (the street at the End of the World) existed in Paris in the 17th century. "This name", adds the author, "which came from the fact that it had for a long time been near the walls of the city, had been represented in a rebus on the tavern sign. It had been represented by a bone (os), a he-goat (bouc), a horned owl (duc) and a world (monde)" (4). Next to the blazon of the hereditary nobility's heraldry, we discover another form of blazonry whose armorial bearings are merely expressive tributaries of the rebus. The latter describe commoners, arrived by fortune at the rank of persons of quality. Francois Myron, Parisian magistrate in 1604, thus wore one "of gules a round mirror", (Myre-rond) (5). A nouveau riche of the same kind, head of the monastery of St Bartholomew in London, Prior Bolton, who occupied the office from 1532 to 1539, had his coat of arms carved in the bow window of the triforium from where he watched over the pious exercises of his monks. We can see an arrow (bolt) piercing a little barrel (tun), hence Bolton (Plate III). In his *Enigmas of the Streets of Paris*, Edouard Fournier, whom we have just quoted, after having initiated us into the disputes between Louis XIV and Louvois during the building of the Hotel des Invalides in Paris, the latter wanting to place his coat of arms next to that of the King, thereby contravening the orders of the King, tells us that Louvois arranged in some manner to affix his memory on the Invalides in an immutable and very obvious manner.

"Enter the Court of Honor of the Hotel, look at the garret windows which crown the facades of the quadrilateral monument; when you look at the fifth of these garret windows which are aligned at the summit of the eastern bay near the church, examine it well. Its ornamentation is very unusual. You find a wolf sculpted up to the waist; its paws falling on the opening of a bull's-eye window which they surround; the head is half hidden under a clump of palm leaves and the eyes are firmly fixed on the courtyard ground. There is here, without your suspecting it, a monumental pun ---the kind often made through

imagery of heraldry ---and in this stone pun lies the conceited minister's revenge and satisfaction. This wolf looks, this wolf sees (6). It is his emblem! So that no one could doubt it, on the next garret window to the right, he had sculpted an exploding barrel of powder, a symbol of war, whose impetuous minister he was; on the left hand window, a panache of ostrich feathers, attributes of a high and powerful lord, as he claimed to be; and on the other two garret windows of the same bay, an owl and a bat, birds of vigilance, his great virtue. Colbert (another minister), whose fortune had the same origin as that of Louvois, and who had no less vainglorious pretensions to nobility, had taken as his emblem the grass snake (7), just as Louvois had chosen the wolf".

The fondness for the rebus, last echo of the sacred language, has considerably weakened in our day. It is barely cultivated and it scarcely interests school children of the present generation. By ceasing to give the science of blazonry the means to decipher its enigmas, the rebus has lost the esoteric value it once possessed. We find it today list in the last pages of magazines, where, as a recreational pastime, its role is confined to the expressive image of a few proverbs. Barely do we notice, once in a great while, a proper application of this fallen art, frequently directed to advertising purposes. Thus a large modern firm, specializing in the manufacture of sewing machines, adopted for its publicity a well-known poster. It represents a seated woman working at the sewing machine in the center of a majestic S. People see above all the initial of the manufacturer, although the rebus, is clear with its transparent meaning: this woman sews in her pregnancy (8), which is an allusion to the softness of the mechanism.

Time, which ruins and devours human work, has not spread the old hermetic language. Indifference, ignorance, and oblivion have completed the disintegrating action of centuries. Nevertheless, one could not maintain that it has been lost completely; a few initiates preserve its rules and know how to make advantage of the resources it offers in the transmission of secret truths or use it as a mnemonic key to teaching.

In the year 1843, conscripts assigned to the 46th Infantry Regiment in garrison in Paris could every week meet a rather unusual professor crossing the courtyard of the Louis-Philippe barracks. According to an eyewitness ---one of our relatives, a non-commissioned officer at the time, who assiduously followed his lessons ---he was a man still young, carelessly dressed, with long hair falling in curls on his shoulders, who very expressive physiognomy bore the imprint of a remarkable intelligence. In the evening he taught the soldiers who desired it the history of France for a small sum, and he used a method which he insisted was known since the oldest antiquity. In reality, this class, so seductive for its students, was based on the traditional phonetic cabala (9) .

A few examples, chosen among the ones that we remember, will give a rough idea of the process.

After a short preamble on approximately ten conventional signs, destined by their form and their grouping to help retrieve all historical dates, the professor drew on the blackboard a very simplified drawing. This image, which was easily engraved on the memory, was in a way the complete symbol of the reign studied.

The first of these drawings showed a man standing up in top of a tower and holding a torch in his hand. On a horizontal line representing the ground, three accessories were placed next to each other: a chair, a cross, a plate. The explanation of the drawing was simple. That which the man was raising in his hand was used as a beacon ---beacon in hand or in French, phare a mains, phonetically identical to the name Pharamond (10). The tower supporting him signified the number 1: Pharamond was, it is said, the first King of France. Finally, the chair, a hieroglyph of the number 4, the cross, that of the number 2, and the plate, sign of zero, gives the number 420, presume date of the crowning of the legendary king.

Clovis, we did not know it, was one of those scamps who could only be controlled with strong means Turbulent, aggressive, bellicose, quick to break everything, he thought of nothing but mischief and fights. His good parents, as much to subdue him as to give a measure of prudence, had screwed him onto his chair. The entire court knew that he was held by a screw (11). The chair and the two hunting horns placed on the ground provided the date 466.

Clotaire, of an indolent nature, promenaded his melancholy in a field surrounded by walls; the unfortunate was thus closed in his land (12) ---Clotaire.

Chilperic ---we don't know why ---was writhing in a frying pan like a simple catfish, screaming out of breath: I am dying here! (13), hence Chilperic.

Dagobert, putting on the bellicose appearance of a warrior, brandished a dagger and was clothed in a mail, hence Dagobert (14) .

Saint Louis ---who would have thought? ---highly esteemed the polish and shine of freshly minted golden coins; he spent his free time melting his old louis (the coin of the period) in order to have new ones (15) which also stands for Louis Neuf:

Louis IX.

And as for the little corporal ---grandeur and decadence ---his blazon needed no character. A table covered with a tablecloth and supporting an ordinary saucepan were enough to identify him ---Napolean (16) .

These puns, these plays on words, associated or not with the rebus, were used by the initiates as subterfuges for their verbal conversations. In acroamatic works, anagrams were reserved, sometimes to disguise the title, removing from the layman the directing thought of the work. It is the case in particular of a small and curious book so cleverly closed that it is impossible to know what the subject of it is. It is attributed to Tiphaigne de la Roche, and it bears the unusual title of Amilec ou la graine d'hommes (17). It is an assemblage of anagrams and puns. One should read instead, Alcmie, ou la crème d'Aum (Alchemy, or the Cream of Aum). Neophytes will learn that it is an authentic alchemical treatise, since in the 13th century alchemy was written alkimie, alkemie, or alkmie; that the point of science revealed by the author pertains to the extraction of the spirit enclosed in the material prima, a philosophical virgin, which bears the same sign as the celestial Virgin, the monogram AUM; and that finally this extraction must be accomplished using a process analogous to that which allows us to separate cream from milk, which was also taught by Basil Valentine, Tollius, Philalethes, and the characters of the Liber Mutus. By removing the veil from the title, one can see how suggestive this one is, since it announces the revelation the revelation of the secret means suitable to obtain this cream of the milk of the Virgin which few researchers have had the fortune of possessing. Tiphaigne de la Roche, who is almost totally unknown, was nevertheless one of the most learned Adepts of the 18th century. In another treatise entitled Giphantie (an anagram of Tiphaigne), he perfectly describes the photographic process, and shows that he knew the chemical manipulations concerning the developing and fixing of the image one century before its discovery by Daguerre and Niepce de Saint-Victor.
